VOL. LXIII NEW YORK, THURSDAY, JULY 4, 1907 No. 3057

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Political Topics

Two Republican candidates for the Presidency attended the commencement exercises at Yale University last week. Senator Knox, on the evening of the 24th, spoke to the graduating class of the Law School on the development and limits of the Federal power for the regulation of interstate commerce. Two days later the degree of Doctor of Laws was conferred upon him by the University. At the dinner of the alumni, that afternoon, Secretary Taft, a member of the corporation, was one of the speakers, and in the course of his remarks he referred to the political aspirations of Senator Knox and himself as follows:

"Senator Knox agreed after I was chosen to speak this afternoon for those awarded the Doctor of Laws degree that I was to tell this story to express our present view of the political situation.

"A long time ago there was a Republican Governor elected in Kentucky, and an old man who had voted the Republican ticket for years without any result came down off the mountains on his old mare, Jenny. He hung around the public square till he became finally of the opinion that Republicans were ungrateful.

"He at last grew tired of waiting and turned his horse's head toward his mountain home, when some of the boys who sat on the piazza of the hotel at Frankfort called out to him and asked him what he looked so glum about. He stopped his mare and said, slowly and sadly:

"'Well, boys, I've heard it said that the office should seek the man and not the man the office. I've been down here for several days, and I haven't seen any offices seeking the man, but if you see any, you just tell them that you seen old Jim Stubbs going down the Alexandria pike on his little mare, Jenny, and that he was going d—n slow.'

"If there are men around this country who are prophesying about Brother Knox and myself I want to say the only handicap he has had in the race, that of not being a Yale man, was removed today when he was given a Yale degree."

——At their convention, on the 27th ult., the Democrats of Pennsylvania nominated John G. Harman for Treasurer, upon a platform confined to State issues. At the meeting of the committee on resolutions, S. M. Seibert insisted upon offering a resolution endorsing the candidacy of Mr. Bryan, "our peerless leader and statesman," but it was promptly laid upon the table. In the convention he sought to introduce the subject by presenting a minority report, but this was excluded upon the ground that no minority report had been made in the committee. It is recalled that in last year's platform Mr. Bryan received the commendation now withheld, and that the President was characterized as "a feeble imitator" of him.——Morgan J. O'Brien, a prominent Democrat and for many years a Justice of the Supreme Court of the State of New York, speaks in a published interview of the factions of his party in that State, and of the efforts made to find some common ground on which they can meet. In his judgment, this common ground is tariff reform.

Fraud on the Public Lands

It appears that the indictments reported by a Federal grand jury at Denver on the 22d ult., cover a wide field and were the result of an investigation which had been in progress for several months. Of the seventy-three persons indicted, fifty-five are accused of defrauding the Government under the laws relating to coal land and timber land. At this writing the names of only about a dozen have

been made known. The following prominent residents of Denver or neighboring places were promptly arrested. At least four of them, according to the Denver newspapers, are millionaires:

Edgar M. Biggs, president of the New Mexico Lumber Company; John J. McGinnity and Charles D. McPhee, directors of the same company; A. T. Sullenberger, president of the Pagosa Springs Lumber Company; Charles H. Freeman, of Pagosa, his associate; John B. McMillan, connected with a coal company whose lands are in Routt County; Otis B. Spencer, politician, formerly clerk of the District Court, connected with the Calumet Fuel Company; F. W. Keitel, coal operator in Routt County; John A. Porter, president of the Durango Fuel Company, and formerly president of the Porter Fuel Company, whose coal lands are now the property of the Southern Pacific Coal Company; Robert Forrester, formerly Chief Geologist of the Denver & Rio Grande Railroad Company, and now Geologist of the Utah Fuel Company, which holds that railroad's coal lands.

Among the others indicted are known to be certain bankers of Durango, and the officers of coal or lumber companies controlled by capitalists in Wisconsin, Missouri, Iowa, Wyoming and other States. The investigation was made under the direction of Marsden C. Burch, of the Department of Justice, assisted by L. C. Wheeler, of the Secret Service.——Suits were begun at Cheyenne, Wyo., on the 26th ult., by the Government and against the Union Pacific Railroad Company; William D. Cornish, of New Jersey, vice-president of that company; the Union Pacific Coal Company, and Dyer O. Clark (a brother of Senator Clark, of Wyoming), vice-president and general manager of this coal company, to recover coal lands in Wyoming alleged to have been taken from the Government fraudulently, together with the value of the coal mined in these lands, which are said to be worth several million dollars. It is alleged that for making the fraudulent entries tramps were hired at $5 or $10 apiece.——At Tacoma, on the 22d ult., the Government appeared as complainant in six suits against the Oregon Railroad & Navigation Company, the Portland Coal and Coke Company, O. E. Lytle, William Crooks and others, alleging fraud in the acquisition of coal lands. It is asserted that this coal company is subsidiary to the railroad company, which is a part of the Union Pacific system.——B. F. Jetter and C. B. Van Trees, of Butler, Mo., have pleaded guilty to the charge that they employed old soldiers for the fraudulent acquisition of public land in South Dakota, and have been sent to jail for four months.——The indictments found in Denver closely following the convictions in Idaho and the imposition of sentences in Nebraska, were announced at about the time of the closing session of the recent land convention in that city, a convention dominated by influences hostile to a considerable part of the land policy of President Roosevelt and the Interior Department. In that convention was read a long letter from the President, who asserted that his policy had been misrepresented in the pamphlets which the program committee of the convention had issued. The Government, he said, was striving to promote actual home-making on the public lands, and to prevent the acquisition of agricultural, coal and timber lands by fraud. The men opposing the course of the Government were "doing all in their power to turn the public lands over to be exploited by men and corporations (for the most part by very rich men and very powerful corporations) whose interests are hostile to those of the home-makers, and who wish to monopolize the land, and then to skin it and leave it immensely impaired in value for the generations to come."

Railway and Trust Questions

Some weeks ago it was said in Washington that no decision as to action against the Eastern railroads engaged in the bituminous coal trade had been reached. It is now asserted that the Government will prosecute the Pennsylvania, Baltimore & Ohio, Chesapeake & Ohio, Norfolk & Western and two or three other companies, under the Sherman act.——The suit against what is called the Powder Trust, it is now reported, will be tried in New York. Senator DuPont is president of one of the allied corporations. It is alleged that combination has enabled them to exact excessive prices from the Government as well as from the public. They received more than $4,000,000 last year from the Government, for smokeless powder.——Negotiations with the steel companies

for the manufacture of an improved steel rail by a process and of a shape suggested by the late President Cassatt, have been interrupted by differences of opinion as to price, the manufacturers insisting that the uniform rate (which is now $28 per ton) be increased to $33.——Before imposing fines in the Standard Oil rebate cases tried at Chicago, Judge Landis called for information as to the financial resources and dividend payments of the company. Under the law, the fines may be made to exceed $29,000,000. Counsel for the company declined to supply the desired information, and thereupon the judge ordered subpoenas to be issued for John D. Rockefeller and other officers of the company, who are required to appear before him on the 6th. The Government's records at Washington show that the dividends declared and paid in the last ten years amount to nearly $400,000,000.

The Panama Canal

Owing to published statements alleging great dissatisfaction on the part of the officers now in charge on the Isthmus, and also the discovery of corruption in canal affairs, Secretary Taft has given to the press a denial of all these reports, whether assertions or insinuations. The work, he says, is going on finely. From Lieutenant-Colonel Goethals there has been no intimation of dissatisfaction. Mr. Ross, the general disbursing agent, who was an efficient officer, retired to engage in private business. It is not true that Commissioner Jackson Smith, who has charge of labor, has resigned. Auditor Benson and Engineer Ripley resigned voluntarily. The latter, who was designing locks, did not agree with Lieutenant-Colonel Goethals as to some of the work. Careful investigation has disclosed "not a penny of graft." Expert accountants were sent to the Isthmus not because of any suspicion but simply for the reason that Lieutenant-Colonel Goethals, when assuming control, asked that the cash be counted, and also in order that the methods of accounting might, if possible, be improved. The headquarters establishment at Washington will be reduced to a mere bureau, and the bulk of the executive and administrative work will be done on the Isthmus. Along the canal route, the health record was never better than at present, altho the weather has recently been unusually favorable for the breeding of mosquitoes. Extraordinary measures for the extermination of these pests have been taken, including the cutting of vegetation on the banks of the Obispo River and the stimulation of the current of this stream by the use of dynamite at points where it has been checked.

San Francisco

Sentence in the case of Mayor Schmitz will not be pronounced until the 8th, and in the meantime he will remain in jail.——Judge Hebbard, of the Superior Court, attempted to commit suicide, last week, owing to the Bar Association's recommendation that he be impeached for intemperance, unless he should at once resign. This judge was severely criticised for his decisions in favor of Abraham Ruef at the time when the latter was striving to prevent the investigation which has disclosed so much corruption.——Rudolph Spreckels has nearly perfected his plan for providing permanent safeguards against municipal corruption by means of an unofficial civic auditing agency. It will cost, he thinks, about $100,000 a year, and will save twenty times that sum for the taxpayers.——James D. Phelan has returned to the city from New York, with definite pledges of mortgage loans of $4,500,000 for new buildings. The Eastern people, he says, are ready to loan $100,000,000 when they are satisfied that law is to prevail and lawbreakers are to be punished in San Francisco. The new acting Mayor, in his opinion, should be a man who will so commend himself to the people that they will elect him Mayor in November. He himself would not be a candidate in November, and he cannot imagine a combination of circumstances that would force him to accept appointment for the months between the present time and January 1st.

Cuba

In a speech at St. Louis, on May 30th, Secretary Taft's estimate of the time required for carrying out the plans of the government of intervention showed that at least eighteen months must elapse before the island could be

restored to the Cuban people. Some of the newspapers in Havana regard this estimate as a reasonable one, but it is not approved by Liberal leaders, one of whom, General Loynaz de Castillo, has sent to the Secretary the following telegram:

"The newspapers say that eighteen months will be required after the completion of the census to restore the republic. We hope that such an unjust and unlawful delay will not be. It must not be. Cuba is anxious that her independence shall be postponed not one day beyond July 4, 1908."

——Secretary Taft, as directed by the President, on the 29th ult. instructed Governor Magoon to purchase all the Catholic Church property in the diocese of Havana now occupied by the Government. The appraised value of this property, which includes the custom house at Havana, is $1,499,550. For more than forty years it has been occupied by the Government as a tenant. Nearly six years ago General Wood agreed to pay a rent of 5 per cent. of its value, and took a five years' option for purchase. This option, once extended, expired on June 30th. According to the agreement, 25 per cent. of the rent paid since the option was given is deducted, so that the Government pays $1,388,646. Purchase was opposed by some Cubans, upon the ground that the price was too high, but thoro investigation convinced the President and Secretary Taft that the price was reasonable. An offer to the Church of a larger sum from Count William Redding was pending, and if the Government had not bought the property it would have found it necessary to obtain possession of it by condemnation proceedings, probably at much larger expense. Count Redding desired to buy it for a steamship company. No decision has been reached as to the purchase of the Church property in Santiago, which is valued at about $600,000.

The Hague Conference

The Peace Conference is now busily engaged in the consideration of the proposals brought forward by various nations, each of the four committees given in our last issue being divided into subcommittees for the discussion and formulation of specific questions. The most interesting point so far developed is the question of the rights of neutral commerce now under consideration in the fourth Committee, that on the Geneva Convention. Joseph H. Choate presented the following resolution and supported it by an eloquent speech of an hour and a half:

"The private property of all citizens of signatory powers, with the exception of contraband of war, shall be exempt on the high seas or elsewhere from capture or seizure by the armed vesels or military forces of said powers. Nothing in this rule implies in any way the inviolability of vessels which will attempt to enter a port blockaded by the naval forces of said powers, nor of the cargo of said vessels."

Mr. Choate stated that this principle was an American tradition dating from the Revolutionary War of 1776, and the United States had upheld it in its treaties with Prussia, Austria and Italy. The Institute of International Law had approved it, and it had received the support of such authorities as John Stuart Mill, Cobden, Count Nesselrode and Professor Martens. He declared that the old-time privateering was losing its importance, and it was to the interest of all nations to restrict operations to the belligerent forces. In conclusion he said that President Roosevelt held the question to be of so great importance that he wished to elicit an expression of opinion on it by a vote of all the countries represented at the Conference. Count Tornielli and Senhor Barbosa, representatives of Italy and Brazil, expressed their approval of the American proposition. The Russian representatives objected, and it is expected that France, Japan and Great Britain will also oppose the resolution. Count Nelidoff argued that the fear of damage to commercial interests was at present the greatest deterrent of war, and that the adoption of Mr. Choate's proposal would therefore not be conducive to the maintenance of peace. Professor Martens, president of the Committee, said that sentiment and theory must often give way to the convenience of nations. Great Britain has expressed her willingness to give up the right of search and abolish contraband of war. The proposal has the following wording:

"In order to diminish the difficulties met by the commerce of neutral powers in case of war, the British Government is ready to aban-

don the principle of contraband in case of war between powers which sign a convention adopting this principle. The right of search will not be exercised, except to prove the neutral character of commercial vessels."

The reasons why Great Britain is prepared to abandon the principal of contraband of war, on which she insisted at the last Hague Conference, are: First, the impossibility of defining contraband; second, the danger of enforcing the right of search; third, the changed conditions of land and water transportation. In the Committee on Maritime War Gen. Horace Porter presented the following proposition:

"The bombardment by a naval force of unfortified and undefended towns, villages, or buildings is forbidden, altho such towns, villages, or buildings are liable to damages incidental to the destruction of military or naval establishments, public depots of munitions of war or vessels of war in port, and such towns, villages, or buildings are liable to bombardment when reasonable requisitions for provisions and supplies at the time essential to the naval force are withheld, in which case due notice of the bombardment must be given. The bombardment of unfortified and undefended towns and places for the non-payment of ransom is forbidden."

The question of the laying of submarine mines was actively discussed. Captain Ottley, the British naval delegate, who has been one of the foremost inventors of such mines, proposed four rules which would greatly limit their use. He urged the abolition of unanchored submarine mines and of mines liable to get adrift from anchorage, the restriction of the use of mines to territorial waters within ten miles of naval bases and fortified ports, and requiring that notice be given of the laying of such mines. Mr. Tsudzuki, the Japanese delegate, favored allowing the use of submarine mines which would sink automatically at the end of thirty minutes or some other time limit, arguing that these would be very useful in the case of ships pursued by an enemy. France has presented the following resolution to prevent the beginning of hostilities without a formal declaration of war:

"The contracting powers agree that hostilities among them cannot begin without advanced and unequivocal notice, having either the form of a declaration of war supported by facts or the form of an ultimatum with a conditional declaration of war. A state of war must be communicated to neutral powers without delay."

General Yermoloff, of Russia, spoke in favor of the requirements of due warning on the ground that at present the possibility that a country can begin open hostilities at any time without warning was the chief cause of the maintenance of heavy armaments. France has introduced the following proposals in regard to neutrality:

"That neutral countries are responsible only for acts committed by their subjects within their territories. No neutral country can permit the formation of a military body on its territory or allow enlistment in favor of belligerents, the proposition continues, but it is not responsible if some of its subjects cross the frontier and enter the service of belligerents. A neutral country is not obliged to prevent the exportation of arms or ammunition in favor of belligerents. Escaped prisoners arriving on the territory of a neutral country become free."

The House of Lords

The resolution for the curtailment of the power of the House of Lords, given in our last week's issue, was, on presentation to the House of Commons by the Prime Minister, adopted by a vote of 432 to 147. An amendment, moved by the Labor party, favoring the abolition of the House of Lords was rejected by a vote of 315 to 100. Premier Campbell-Bannerman stated that this resolution would not be sent to the House of Lords and would therefore have no legal effect, but would simply be an expression of the opinion of the House of Commons as to the subordinate authority of the Lords. Legislation dealing with the question would later be introduced by the Government. It is proposed, in case of a disagreement between the two Houses as to a bill, that there should be a private conference between a small and equal number of members of the two houses. If after this the two Houses failed to agree, the House of Commons could again pass the bill at the end of a suitable interval of time, say, six months; the discussion to be restricted to new matter. If the Lords still rejected it and in conference failed to come to an agreement, the bill would be past over their heads. Mr. Balfour, leader of the Opposition, said that the House of Lords now occupied a position subordinate to the House of Commons, and the question was whether it should be made more subordinate still. If the House of Commons was

not to be prevented from doing everything it wished, the question was whether, in one day, institutions might not be upset which had taken centuries to rear and which, once destroyed, could never be restored. He thought there could be no better chamber than this subordinate assembly, the House of Lords.

Oxford Degrees

Thirty-five honorary doctorates were conferred by the University of Oxford at its convocation June 26th. Among them were Prince Arthur of Connaught, United States Ambassador Reid, Sir Henry Campbell-Bannerman, Lord Chief Justice Alverstone, General Sir Evelyn Wood, August Rodin, Hubert Herkomer, General William Booth, Sir William Ramsay, Sir Norman Lockyer, Prof. Archibald Sayce, Rudyard Kipling, Camille Saint-Saëns and Samuel L. Clemens. Mark Twain received the greatest amount of applause as well as chaff from the undergraduates as he appeared on the platform of the Sheldonian Theater in his scarlet gown and gray hood, while Lord Curzon of Kedleston, Chancellor of the University, addressed him with the words:

"Vir jocundissime, lepillissime, facetiosissime, qui totius orbis terrarum latera nativa tua hilaritate concutis, ego, auctoritate mea et totius universitatis, admitto te ad gradum doctoris in literis honoris causa."

Clemenceau and Albert

Premier Clemenceau has won two victories during the past week; one by making friends with Marcelin Albert, the leader of the vine-growers of the Midi, and the other by securing a substantial majority in favor of his policy from the Chamber of Deputies. M. Albert, whom, according to the boasts of the Southerners, all the soldiers in France could not capture, became converted by his half-hour's talk with the Premier into an emissary of peace and a semi-official representative of the Government. In this capacity he was not enthusiastically received by his fellow countrymen of the Midi, which he toured in an automobile, endeavoring to cast oil on the waters which he had troubled. He was repudiated by some of his lieutenants, and looked upon with suspicion by the people, especially after it leaked out that he had borrowed 100 francs from M. Clemenceau. After making speeches in favor of law and order in the towns where he had previously organized revolutionary manifestations, he surrendered himself to the authorities at Montpellier, notifying the Premier that he had fulfilled his promises and repaying the loan of 100 francs. The rebellious provinces are tolerably quiet, altho the people refuse to elect new officers to take the place of those who resigned. In the Chamber of Deputies the Premier received a vote of confidence by a majority of 120, after a tumultuous debate of eight hours, in which the Deputies from the South joined with the Socialists in a furious attack upon the Government. The Premier was charged with turning the country into a slaughter house by his use of troops against a starving and peaceable people, and his impeachment was threatened. It was alleged by the Radical Socialists that the troops had fired without warning on men, women and children. In reply the Premier demanded a Parliamentary investigation of the charges, and defended the attitude of the Government on the ground that the provinces were practically in a state of revolt by their refusal to pay taxes and obey the laws. He claimed that the misery could not be as great as had been said, because the deposits in the savings banks had increased and $800 had been promptly raised for the mutineers of the Seventeenth Regiment.——The Government bill for the relief of the viticulturists of the South by suppressing the adulteration of wines was passed by the Chamber and Senate. It provides for a supplementary tax of $8 per hundred kilos on sugar used in the manufacture of certain wines, and requires all growers to make an annual declaration at the mayoralty of their communes of the acreage cultivated, and quantity of wine produced and in stock, and whether it is intended for sale or otherwise. Since this will restrict the use of alcohol made from beet sugar, it is proposed to increase the duty on petroleum, so as to stimulate the use of alcohol for fuel, power and illumination. In order to increase the diversity of agri-

culture in the distrest provinces, the Government is prepared to remit land taxes for five years in case the land now in vineyards is devoted to other crops. This dependence upon a single crop is responsible for the financial failure of the region. Less wine is now consumed in France than forty years ago, with substantially the same population. This is due to the alarming increase in the use of ardent alcoholic liquors, such as brandy and absinthe. It appears that the wine producers of the South have no very good ground for complaint of the adulteration of wine. The thirty-five communes in the provinces of Aude and Pyrenees Orientals, which have been the center of the revolt, sold in 1906 3,224,418 hectoliters of wine, altho, according to the statistics of the Agricultural Department, the actual amount of genuine wine produced was only 1,146,240 hectoliters. The mutinous Seventeenth Infantry, numbering 627 men, have been sent to Sfax, Tunis, as a punishment for their refusal to obey orders.

Russia

The Treasury wagon containing $170,000 was attacked with bombs and robbed in Tiflis, the capital of Russian Trans-Caucasia. The wagon, escorted by Cossacks, was passing thru Erivan square from the post office to the Imperial Bank when the explosion occurred. At least two of the guard were killed and some fifty of the bystanders wounded. The bags containing the money were all carried off. A Jewish girl, moved by remorse, a few days later confessed to having been one of the conspirators. Such robberies on a smaller scale have been very common in Russia of late. Some of them are doubtless ordinary robberies. Others have a political motive, being contrived by the Terrorists for the purpose of securing funds for their operations. Much of the money obtained by the Terrorists from their robbery or embezzlement of Government funds is said to have been recklessly squandered or stolen by traitors of the organization. There are threats of renewed attempts upon the lives of the Czar and Premier Stolypin and other officials in consequence of the dissolution of the Duma, but so far no violence of importance is reported except riots and incendiarism among the peasants, especially in the province of Tula. The Social Revolutionists and Group of Toil of the late Duma have joined in the following manifesto, which is being circulated among the people. It is remarkable for the boldness of its language, since it accuses the Emperor directly of responsibility for the acts of the Government:

"Citizens: You sent us to fight for freedom, for the rights of the people, for land and liberty. The Duma majority was oppositional It rejected laws increasing the power of the Government bureaucrats, it demanded an accounting of repressions of peasants and workmen and of bestialities in prisons, its committees elaborated many laws and projects covering the most important needs of the people, and its Agrarian Commission acepted the principle of the compulsory expropriation of land

"Under the perpetual threat of a dissolution of Parliament the Moderate section of the Duma abated the demands of the people, but the Government replied with an uncompromising refusal, adopted the interests of the land owners and nobles, and took under its protection the wildest lawlessness of the local authorities.

"The Emperor did not hesitate before a violation of his manifesto of October 30th, the Fundamental Laws, and his solemn promise given at the Winter Palace to the Deputies of the first Duma to defend the liberties granted to the people. He announced before the whole people that the election law would only be modified with the assent of the Duma, but now, without the permission of Parliament, the people's rights are trampled upon, and the Government, relying on bayonets, openly pursues a course of forcible violation of the law.

The Japanese Ambassador

Rumors have been prevalent in Washington for some days, emanating from Tokyo, that Ambassador Aoki would be recalled, as the result of a dissatisfaction on the part of the Japanese Government with his treatment of the matters involved. We now have the authoritative information from Tokyo that this is not true, altho Count Okuma, who is said to have been long hostile to Viscount Aoki, has done his best to have him recalled. Viscount Hayashi, the Japanese Minister of Foreign Affairs, is the junior of Viscount Aoki in diplomatic service, but any delicacy on that account would hardly, as has been suggested, have prevented his recall if the interests of Japan required it. The retention of Aoki shows that the Ministry headed by Marquis Saionji has been assured of the support of both the Conservative and

Progressive parties in its attitude toward America. Viscount Aoki has not taken a jingo attitude. He has recognized that our National Government, owing to the rights of States, cannot control the police protection of foreigners, and he advised an opportunist policy, and the effort to seek only what it would be possible to secure. This did not please the more ardent patriots of Japan, and for a while the Saionji Ministry may have wavered as to its proper course; but it was made clear by friendly foreign Powers, and also by the business interests of Japan itself, that any hostile and precipitate action would endanger public credit and cause financial disaster at a time when it is of the utmost importance to keep public credit good. Accordingly Saionji was able to secure the adhesion of the two great parties and to retain Aoki at Washington.——A further disturbance of the amicable relations between the United States and Japan has occurred thru the action of the Board of Police Commissioners of San Francisco in denying the applications of five Japanese for the privilege of renewing their permits to keep intelligence offices in that city, and refusing two Japanese applicants who desired to obtain new permits for the same business, on the ground that the applicants were not citizens of the United States. On receipt of the news in Tokyo a joint meeting of seven Chambers of Commerce was held, at which it was voted to send the following address to American Chambers of Commerce:

"It has always been a matter of profound satisfaction to the people of Japan to witness the constant growth of cordial relations between our two countries and of our community interests in the fields of trade and commerce.

"But since last year the people in a section of your country have unfortunately acted in a manner calculated to prejudice the legitimate rights of Japanese people, who have been frequently subjected to unjust and humiliating treatment at the hands of a lawless element prevailing there. The right of education has been denied them; their houses have repeatedly been attacked and their property destroyed without the least cause or provocation, not only the treaty rights of the Japanese being wantonly disregarded, but their persons and property having been exposed to serious dangers.

"It is to be extremely regretted that such unfortunate incidents should be allowed to occur so frequently, and it is feared that unless they are speedily stopped, the ill feeling which our countrymen are now constrained to harbor against the people of a single section in America may eventually have an unhappy effect upon the development of the commercial relations between the two nations, for while the United States is a good customer for our natural products, Japan is also increasing her demand for American goods and promises to become one of the most important markets for your ever expanding and prosperous industries. Should the progress of trade and commerce between the two nations become obstructed as the result of the unwarranted action of a small section of your population, the loss sustained by the two countries would be incalculable."

The Religious Movement in Austria

The latest reports of the *Fort von Rom* agitation in Austria show that the movement has evidently become a fixt fact in modern church life. The total number of converts from Catholicism to Protestantism during the past year was 3,431, making a total of 42,595 since the inauguration of the Away from Rome propaganda nine years ago. The Catholic authorities are also changing their attitude toward the crusade. Instead of ignoring it as insignificant, as was the manner at first, they are working actively against it, especially thru the Bonifacius Verein, which seeks to labor particularly where Protestantism is active. Now the movement is centered in and around Vienna, and no longer in Bohemia and Moravia. More than one-half the conversions are reported from the Archbishopric of Vienna. The greatest difficulty is to supply the new congregations with pastors. As a rule, these must come from other sections of Protestant Europe, especially Germany, but against the activity of these outsiders the Catholic local authorities do all they can. Some of the leading Catholic papers, such as the *Germania,* in Berlin, and the *Volkszeitung,* in Cologne, openly declare that the reason why the Catholics of Austria have not been successful in combating this Protestant propaganda is the intellectual and spiritual weakness of the Catholic clergy. Side by side with this movement is found a strange contingent of Jewish converts to Protestantism. During the past year no fewer than 227 Jews in Vienna became Protestant Christians. About four-fifths of these converts join the Lutheran Church and the others the Reformed.

The Happiness of Nations

BY JAMES MACKAYE

[The three articles which follow this give the views of most competent scholars on the important question involved, a question which calls for consideration on our Nation's birthday.—EDITOR.]

The first requisite in the steersman of a state, as of a ship, is a knowledge of its goal. No helmsman, however skilled in handling a wheel or experienced in seamanship, would be trusted to guide a vessel unless he knew and could specify in which direction it should go. No political leader, however skilled in administration or experienced in statecraft, should be trusted to guide a nation unless he knows and can specify in which direction it should go. *A knowledge of the goal of nations is the first essential of statesmanship.* The lack of such knowledge is the cause of the failure of all states of which history has record and of the helpless drifting of the nations of today.

The political ideals of the ancient and medieval worlds were those of power. The efforts of the states of those times were directed to augmenting the power of dynasties, and the quarrels between nations were quarrels between rulers, and arose from the envy, avarice, or ambition of individuals. The people existed for the benefit of the rulers instead of the rulers for the benefit of the people. At the downfall of the feudal system the divided authority of the nobles was replaced by the central authority of the king, and soon after this occurrence there appeared among European nations the first political ideal other than dynastic power.

The political theorists of that day looked about them to see if they could discover any one thing which everybody wanted, and came to the conclusion that they had discovered it. They found that everybody wanted *money.* Hence they made the pursuit of money the ideal of society, and reasoned that the accumulation of money in the form of gold and silver was the object for which nations should strive. Acting upon this reasoning they prohibited the exportation of those metals, encouraged the import of raw materials and the export of elaborated or manufactured materials in exchange for them, and endeavored to direct the whole policy of the state with a view to the accumulation of the precious metals. This theory of the goal of society is known as *mercantilism.* It held sway for several centuries, and only received its deathblow in 1776. In that year Adam Smith, after a period of ten years spent in retirement and meditation, brought forth his famous work, "The Wealth of Nations," in which he showed that the goal at which the mercantilists aimed was not the true goal of nations or of society; and hence that the statesmen of England and the other mercantile nations of Europe had for centuries been misdirecting the policy of those nations because they lacked the first essential of statesmanship—a knowledge of the goal of nations. Smith showed that gold and silver were valuable only because they could be exchanged more readily than anything else for other commodities; that money had value only because it represented *wealth.* The possession of precious metals alone could afford no man food, or clothing, or shelter, or any of the other essentials of life. The fact that they could be readily exchanged for things that could afford such essentials had misled the mercantilists into thinking that they constituted the essentials themselves.

The doctrine maintained in "The Wealth of Nations" that wealth, and not money, is the object for which nations should strive is known as *commercialism,* and it is the doctrine at the foundation of our present political economy and of the policies of the commercial nations of

today, tho many of the fallacies of mercantilism survive in modern economic theory and practice.

Adam Smith has been accorded great praise by modern economists for his destruction of the old ideal of mercantilism and his construction of the present ideal of commercialism—for his discovery that wealth and not money is the object of the efforts of nations and of society. This discovery reminds me of a picture I once saw. A callow youth who has just donned his first silk hat and dress suit is being admonished by his mother of the danger of vanity. "Remember, my boy," she says, "it is not the clothes that make the man." With an insight into essentials worthy of a commercial economist, he replies: "You are right, mother. It is not the *clothes*—it is the *hat.*" This youth was evidently a budding Adam Smith, prepared to discover (after ten years of meditation) that it is not the *money* that makes the nation—it is the ***wealth.***

If we would know the true goal of nations we need but follow the instinct of the mercantilists without imitating their superficiality. We need but discover the thing which every one wants, and we do not need even to look about us to discover it. It is sufficient to look within ourselves. The one thing which everyone wants is *happiness.* If they possess this they have no need of money or of wealth, and if they do not possess it, neither money nor wealth can avail them anything. The fact that money can be exchanged for wealth led the mercantilists into mistaking the goal of society. The fact that wealth can be employed to produce happiness leads the commercialists into an analogous mistake. Wherever we turn we find that men, in searching for the *summum bonum,* have mistaken the means for the end, and the two errors herein pointed out are but special cases of a comprehensive class.

The doctrine that happiness constitutes the object of nations or of society is called *utilitarianism,* and I venture to suggest that history will record the progress of the ideal of society from mercantilism through commercialism to utilitarianism.

There appears to be a common but shallow belief that happiness cannot be secured thru political action or successfully pursued as a political ideal. The reasons advanced for this belief are extraordinary, and were they not so commonly encountered among intelligent men, it would be difficult to believe that a sane individual could seriously maintain them. Tho disguised by a multitude of different phrases, these implied criticisms of utilitarianism are reducible to two.

In the first place it is asserted that happiness cannot be sought because we do not know what it is, because it cannot be described or defined, because it is intangible or unrealizable—some persons even asserting that it does not exist. These curious objections arise entirely from confusion in words—they are etymological phenomena and consist, in substance, of a denial that the word "happiness" can be given a definite meaning.

In the second place it is asserted that happiness cannot be sought because we do not know what its causes are; because it is entirely within ourselves and cannot be affected by external causes, some persons even asserting that it must always be sought in vain because of the variation in men's tastes and needs—what is happiness to some being unhappiness to others. Literally interpreted such a statement as this one is a direct contradiction; it is an assertion that happiness is not happiness. Reasonably interpreted it means that what *causes* happiness to some *causes* unhappiness to others. Thus interpreted the statement is undeniably true, but, as I shall presently indicate, constitutes no barrier whatever to those who seek the end of utility.

Recognizing, then, that commercialism is as false a theory of national conduct as mercantilism, let us, very briefly and proximately, formulate the true theory—that of utilitarianism.

I shall briefly outline the foundation principles of this theory by showing first what happiness *is,* and second, what its *causes* are; by indicating first the nature of happiness, and second to what classes of acts the lives of men must be directed in order to successfully produce it in the world as we know it.

The word *happiness* is in the first place what is known in logic as a *term.* Terms are means of expressing or symbolizing human experiences. Human

experiences are of two kinds: (1) Simple; (2) Compound. The second class of experiences can be expressed in terms of simpler experience. The first class cannot. A definable term is one which is expressible in terms of simpler experience. An indefinable term is one which is not so expressible. Therefore, terms expressive of compound experiences can be defined; those expressive of simple experiences cannot. The terms *happiness* and *unhappiness,* like the terms *redness* or *blueness,* are indefinable terms, expressive of simple experiences, inexpressible in terms of other kinds of experience. The only mode by which the meaning of indefinable terms can be made plain is by exemplification.

To claim, as some do, that we cannot tell what happiness is because it cannot be defined, or because the modes of producing it are different in different individuals, is as absurd as to say that we cannot tell what redness is because it cannot be defined, or because the modes of producing it are different under different circumstances. If there is a quality of experience which we care to symbolize by the term *happiness,* then that term has a meaning and we can know what happiness is. If there is not such a quality of experience, then said term has not a meaning and there is no such thing as happiness. In the latter case the term should be eliminated from the language. It has no more title to a place in the dictionary than any other fortuitous combination of letters. This is all there is to the problem of the nature of happiness, and all the controversy on the point has arisen because men persist in mistaking an issue of etymology for an issue of philosophy.

Without stopping, in this brief exposition, to exemplify the familiar terms *happiness* and *unhappiness,* or their equivalents, *pleasure* and *pain,* it may be noted that two modes of their variation are important for our purpose, viz.: (1) The variation in *intensity;* (2) the variation in *duration.*

We may compare the intensities of pleasure and pain by preference thus:

"When a given pleasurable experience bears a relation to a given painful experience of equal duration, such that in order to attain the first we would be willing to undergo an amount of pain equal to, but not exceeding, the second, then the intensity of pleasure involved in the first experience is the equivalent of the intensity of pain involved in the second." *

Altho the terms *intensity of pleasure* and *duration* are neither of them definable, they may, when once exemplified, be employed to define the term *amount* or *quantity of pleasure,* thus: Quantity of pleasure is proportional to both intensity and duration of pleasure, and hence is proportional to their product, being measured by intensity multiplied by duration. The term *amount* or *quantity of pain* may be similarly defined, and quantities of pleasure and pain may be compared by means of preference, just as intensities may be compared. When pleasure and pain are both felt, the term *amount of happiness* or *pleasure* refers to the resultant or algebraic sum of the respective amounts so felt. It is positive if the surplus or resultant is one of happiness; negative if it is one of unhappiness. Indeed, the scale of either intensity or quantity of pleasure and pain is similar to that of the scale of positive and negative numbers familiar to the algebraist, pleasure being regarded as negative pain and pain as negative pleasure.

Having thus given a definite meaning to the term *amount of happiness,* we may employ it to express the fundamental precept of utilitarianism as follows:

Society should pursue those policies which will result in the greatest amount of happiness among men.

Next let us endeavor to ascertain what the general policies are which will lead to the utilitarian goal thus specified.

The amount of happiness achieved by a nation in any given period will be the amount experienced by the average individual composing said nation during that period, multiplied by the number of individuals. In order to arrive at a proximate solution of our problem, therefore, we shall consider the life of an average individual. If we can discover to what kinds or classes of acts the life of such an individual should be confined, and in what ratio it should be divided between them, we shall have laid the foundation

* "The Economy of Happiness," p. 111.

of a technology of happiness. Very briefly, then, let us discuss this problem.

An average man's waking life, with few and negligible exceptions, consists of voluntary acts. Even if he assumes a condition of inactivity or minimum activity, he thereby performs a voluntary act, provided he does it voluntarily. Let us, then, divide voluntary acts into two classes: (1) Those which will result in an amount of happiness greater than will result from an act of minimum activity. (2) Those which will not so result. It sometimes happens that the happiness resulting from an act of minimum activity will be greater than that resulting from any other available alternative. It will be convenient to include such acts in the first category above mentioned. Let us call the first class of acts *useful;* the second class *useless.*

Now it is clear that nothing is to be gained by a man or a community of men by selecting useless acts. Hence the problem of utility may be broadly stated thus:

How may we confine the acts of men to useful ones?

In order to solve this problem, it must, by a succession of approximations, be rendered sufficiently concrete to lead to definite policies. We may begin such a process of approximation by subdividing the class of useful acts. As all useful acts seek happiness, it is clear that they must seek it either directly or indirectly; that is, the immediate object of the act must be either (1) happiness or (2) the means to happiness. Let us now assign names to these classes. Let us call class 1 *consumptive* acts or acts of *consumption,* class 2 *productive* acts or acts of *production.* This enables us to restate the problem of utility more concretely thus:

How may we confine the acts of men to productive and consumptive ones?

It will be useful to proceed to subdivide these subdivisions, considering first, consumptive acts. It is obvious that when seeking happiness directly our object is sometimes (1) the attainment of pleasure, and sometimes (2) the avoidance of pain. Let us call the former class of acts *positive,* the latter class *negative,* consumption. Subdividing productive acts, the most convenient classification for our purpose is into (1) pleasant production, (2) unpleasant production. If, then, an average member of society confines his acts to useful ones, he must at all times be employed in performing acts belonging to some one of the following four classes: (1) positive consumption, (2) negative consumption, (3) pleasant production, (4) unpleasant production, and all the happiness or unhappiness which his life can afford will be that experienced while engaged in the performance of these four classes of acts. Now he can only produce happiness while engaged in positive consumption or pleasant production. All the rest of his life is either spent in indifference or unhappiness. Thus we may render the problem of utility more specific by stating it as follows:

How may we increase the intensity and duration of positive consumption and pleasant production, and diminish the intensity and duration of negative consumption and unpleasant production?

To arrive at a general solution of this problem we must consider the relation which consumption bears to production.

As society is at present ordered, it is the fate of the great majority of adult human beings to spend a large proportion of their lives in securing such adjustment of their environment as is required for their mere existence. In order that men may consume they are compelled to produce, and that form of production which is engaged in solely because it will lead to consumption may be called *compulsory* production. In thus naming it I do not intend to imply that it is physically imposible to refrain from it. It is possible even for a slave to refrain from labor, his alternative being physical punishment, and it is likewise possible for a wage earner to refrain from labor, his alternative being the withdrawal of his means of subsistence. The difference between slave labor and wage labor is not that the first is compulsory and the second is not. It is in the character of the alternatives offered the laborer in the two cases respectively. The first is offered chastisement as an alternative—the second is offered starvation.

Productive acts which are selected, not from any compulsion imposed by the ne-

cessities of men, but from the intrinsic interest which men find in performing them and in contemplating their results, may be called *spontaneous* production. The potentiality for consumption which they involve is not the sole, nor perhaps the principal, reason which men have for selecting them.

We have thus redivided productive acts into (1) compulsory production, (2) non-compulsory, or spontaneous, production. Now it is a matter of familiar observation that compulsory production is, in a vast majority of cases, unpleasant, whereas spontaneous production is as generally pleasant. For the proximate solution of the problem of utility which we seek, therefore, we may regard compulsory as identical with unpleasant production, and spontaneous as identical with pleasant production. Thus useful acts are divided into four classes, two of them unpleasant, viz., compulsory production and negative consumption, and two of them pleasant, viz., spontaneous production and positive consumption, and the problem of utility is reduced to the following:

How may we increase the intensity and duration of the two classes of useful acts that are pleasant, and diminish the intensity and duration of the two classes that are unpleasant?

This method of stating the problem makes very evident the reason why the theories of mercantilism and commercialism have led, and still lead, astray the states and the statesmen who practice them.

Consistent mercantilism would make consumption a minimum, and compulsory production a maximum, restricting, so far as possible, all production to that which leads to the greatest accumulation of gold and silver. By the practice of such a policy the treasure of the state would be augmented most rapidly.

Consistent commercialism would likewise make consumption a minimum and compulsory production a maximum, but there would be no restriction on the kind of wealth produced, since by this theory one kind is as good as another. Obviously wealth will accumulate most rapidly when its production is a maximum and its consumption is a minimum, and in the practice of a policy which would result in such a condition of men's activities, commercialism would find its only consistent application. Indeed, were the theories either of mercantilism or of commercialism applied with complete consistency, their nonsensical character would become plain to all men. But they are not and never have been so applied. In practice all nations deviate from them more or less, and thus the delusion of their soundness is maintained. Were they not inconsistent they would be intolerable. What makes our present commercialism tolerable is the admixture of utilitarianism which it contains, and it is the design of this essay to suggest that in place of such a modest admixture, modern nations, discarding their commercialism, shall adopt the theory and practice of utilitarianism *in toto,* thereby for the first time applying common sense to politics, and placing it upon a moral foundation.

Utilitarianism would make positive consumption a maximum, and compulsory production a minimum, thereby completely reversing the practice required by the theory of commercialism. By adhering to that evil theory the so-called statesmen of today, lacking as their mercantile predecessors did, the first essential of statesmanship, are forcing the state to take a course exactly opposite to that which it should take. Not content with so directing the industrial policy of nations as to make the only life which men have to live on this earth one of perpetual productive activity, they direct said perpetual activity to the task of dissipating those resources of the earth which should be husbanded for the service of a wiser generation. This process, which squanders alike the lives of the present generation and the substance of their posterity, they call "developing the nation's resources," and the various commercial nations of the earth vie with one another to see which can do its developing most rapidly. As the mercantilist concerned himself exclusively with the nation's "treasure," and its favorable "balance of trade," so the commercialist concerns himself exclusively with its "production" of iron and steel, corn and cotton, pork, codfish, and other kinds of wealth forever talking about "output," "imports," "exports," etc. Indeed in our day and

country the people are so occupied with this simultaneous waste of life and resources that they have not the leisure to ask themselves what all their bustle is about. They are so busy doing useless things that they have not time to learn the nature of usefulness. The commercialist, centering his attention upon the accumulation of wealth, sees the whole political problem reversed. He regards consumption as useful only because it leads to production, instead of regarding production as useful only because it leads to consumption. He assumes that the only thing worth considering about the lives of men is the way in which they affect the external and material world, instead of perceiving that the only thing worth considering about the external and material world is the way in which it affects the lives of men; for it is only by employing the lives of the people in the production of happiness that a nation can possibly achieve success. Definitely recognizing this, the utilitarian statesman concerns himself with those policies which will withdraw the lives of men more and more from compulsory production and negative consumption, and expend them more and more upon positive consumption and spontaneous production. In order to see clearly what policies will accomplish these things, let us briefly examine the four classes of useful acts thus specified, considering the relation of each to the two factors of happiness—intensity and duration.

(1) Compulsory production. To improve upon present conditions this class of acts may be dealt with in two ways: (1) Its intensity may be diminished. (2) Its duration may be diminished.

Now it is a fact familiar to all economists that production is most effective when carried on systematically or mechanically. Machines are the ideal producers, and so far as compulsory production is concerned, men should strive to imitate the precision, rapidity and business-like operations of a machine. In other words, high productive power requires a minute division of labor and extensive employment of machinery in the arts. This in turn involves a dreary monotony of labor, and it is difficult to relieve this dreariness in any considerable degree without impairing the efficiency of the labor. Hence, the most practical way to deal with productive acts of this class is to diminish their duration, since improvement in the arts offers us a ready means of accomplishing such a result, whereas comparable means of diminishing their intensity have never been suggested. Thus, of the two alternatives mentioned, the second is the one to adopt. In other words, utility requires that, as men's productive capacity increases, the duration of compulsory production shall diminish.

(2) Negative consumption. Man's capacity to experience pleasure and pain develops in him desires, and desires may be divided into two classes: (1) Those the gratification of which yields an excess of happiness; (2) Those the failure to gratify which yields an excess of unhappiness. Desires of the first class we may name *tastes.* Those of the second class *needs.* Desires are often both tastes and needs. When, thru the agency of a voluntary act, a need is made to result in no excess of pain it is said to be *satisfied;* when it results in an excess of pain, but a less excess than would have resulted had no act of amelioration been performed, it is said to be *relieved.* Negative consumption is occupied with satisfying and relieving needs. Had man no needs negative consumption would not exist, and the less his needs the less of it will be required in his life. Hence the problem of diminishing negative consumption in intensity and duration resolves itself into the problem of eliminating and simplifying the needs of men. By far the most important class of needs are those resulting from illness —mental and physical. It is these, perhaps, more than anything else which prevent the production of an excess of happiness among men. They can practically never be completely satisfied, and can often be only in slight measure relieved. Agencies for preventing, curing or ameliorating disease, then, are among the most important in diminishing the intensity and duration of negative consumption.

Aside from those resulting from illness or weariness and from the demands of mere physical existence, needs are usually the result of defective education. As the influences of education which de-

velop undesirable needs are essentially similar to those which develop undesirable tastes, we may defer the discussion of this part of our problem to the section which treats of positive consumption.

It is obvious that, as the duration of compulsory production and negative consumption diminishes, that of positive consumption and spontaneous production can increase. Thus, by devising means for diminishing the duration of the first two classes of acts, we shall at the same time devise means for increasing the duration of the second two, and indeed, if all the acts of men are useful, there is no other possible mode of accomplishing such a result.

(3) Positive consumption. The intensity of positive consumption can be increased: (1) By increasing the rate of immensely augmenting their output of adaptation of external conditions to men's desires. (2) By simplifying tastes, thus improving the adaptation of men's desires to external conditions. Both of these methods may be employed by nations in attaining their end, but the second is, in general, the better. It is evident that if the desires of a community can be satisfied only by a high rate of consumption, *i. e.*, by the consumption of articles of high labor cost, that a large part of the life of that community is going to be devoted to the production of such articles. If every one requires for his happiness rich food, clothes, jewels and houses, racing stables, yachts and similar luxuries, it is obvious that, with the very best machinery of production devisable, so much time will inevitably be employed in compulsory production that men will have no considerable portion of their lives left to enjoy these things. Under such conditions, the duration of consumption would be reduced to a minimum, and the only reason that it is possible for a few to possess and enjoy such expensive luxuries today is that there are a far vaster number of whose productive power they may avail themselves. It is clear that the powers of production of the modern world, tho greater than at any previous period, are not sufficient to make everybody wealthy. But if the second method of increasing the intensity of consumption is adopted, if the tastes and needs of the community are so trained that the members thereof can derive happiness from the consumption of articles of low labor cost, if simple things will please them, if they are habituated to plain living and high thinking, then a means of immensely augmenting their output happiness is at once available. Expensive luxuries are required only by those who have no resources within themselves. It is the brainless and shallow members of high society who are forced to supply their own resourcelessness by a great variety of unusual and fantastic means of entertainment. Were men educated to love philosophy, science, nature, art and the humanities, and the simpler pleasures of life, all that would be necessary to make them happy would be the leisure required to devote themselves to whatever portions of these illimitable domains most appealed to them. The liberty to commune with nature and with one another, to travel over our wonderfully interesting world, or to devote themselves to some congenial avocation, artistic, scientific or otherwise, would afford happiness far greater than that now gained from the consumption of expensive luxuries by the surfeited sons of opulence. The simpler the tastes and needs of the community, the less production is required to satisfy them, and thus, by combining the cultivation of simple tastes and needs with the stimulation of the productive arts, that portion of human life employed in compulsory labor might be, as time went on, indefinitely diminished in duration, while the portion employed in positive consumption would be proportionally increased.

(4) Spontaneous production is to be distinguished from positive consumption only in the fact that it has indirect as well as direct utility. Both classes of acts are a means to the gratification of tastes, but in gratifying a taste for production something useful is created which may be employed in subsequent consumption. Hence, other things being equal, tastes which lead men to produce are more useful than those which lead them to consume. Thus the pursuit of the fine arts is of very high utility, and the pursuit of science is, if anything, even higher, because of the permanent and widely ramifying effect which an

increase of knowledge has upon the arts of life and the productive power of the community. If it may be said that any one of the four classes of useful acts is more useful than any of the others, it may with most propriety be said of spontaneous production.

The foregoing brief examination is sufficient to reveal what two fundamental policies must be adopted by nations in order to solve the problem of utility. These are: (1) Improvement of the arts thru the introduction of superior machinery and methods, to the end that mankind may be emancipated from compulsory production. (2) Improvement of men thru the education of their tastes and needs, to the end that the leisure made possible by the policy of industrial improvement may be employed in positive consumption and spontaneous production.

It is unnecessary to point out that the present policies of commercialism are not at all like those of utilitarianism as above outlined. The two policies are indeed antipodean. "Commercialism would sacrifice everything—including happiness—to the attainment of wealth. Utilitarianism would sacrifice everything—including wealth—to the attainment of happiness." The ideal of commercialism is to give everybody a job—to keep men eternally busy at compulsory production. So profoundly indeed has that evil theory warped the minds of modern men that many of them actually believe the emancipation of mankind from toil would be a misfortune. To them it seems natural and inevitable that the great majority should be the bondmen of commerce—mere brutes, unable to employ their leisure in any better way than in riot and dissipation. It is true that the brutalizing policies of commercialism tend to develop a degraded populace, and to the mind narrowed by worshipping the ideal of "business" it is natural that no better condition of things can be imagined. But he who once apprehends the true goal of nations will perceive that fear of national leisure constitutes confession of national failure. It is the business of the nation to see that its populace is one capable of converting their lives to the production of happiness, and if it finds them otherwise constituted its first duty is to adopt an educational policy which will correct the evil, not to persist in an industrial policy which can but continue it.

The practice of the theory of utilitarianism, as herein formulated, will probably require the adoption of socialistic policies, and it is the present custom to consider socialistic policies as destructive of individual liberty. This is because the word "liberty" in political discussion has ceased to have any but a formal meaning, and has degenerated into a mere sound, with which the demagog and the platitudinarian deceive the people.

Liberty is necessary to a people's happiness, and it is for that very reason that the policies of commercialism are inadequate to fulfil the requirements of utilitarianism. It is not sufficient to know that the people desire liberty and freedom. It is necessary to inquire what kind of liberty and freedom they desire. They want liberty—true—but liberty *to do what?* They want freedom—true—but freedom *for* and *from* what? Do men want freedom *for* toil, despondency, disease and misery? and freedom *from* leisure, hope, health and happiness? Do they want liberty to indulge in compulsory production and negative consumption, and liberty to avoid indulging in spontaneous production and positive consumption? No, this is not the kind of liberty they want. Under commercialism they have all the freedom for these things that their hearts can desire. The commercial economist may think, and apparently does think, that this is the variety of liberty that men crave; and he is to be credited with skill in pointing out the policies by which it can be realized. Nevertheless, he is mistaken. What men *do* want is freedom *from* toil, despondency, disease and misery, and freedom *for* leisure, hope, health and happiness. What they *do* want is liberty to indulge in spontaneous production and positive consumption, and liberty to avoid indulging in compulsory production and negative consumption. To realize this kind of liberty the present policies of commercialism are not in the least adapted; whereas the suggested policies of utilitarianism are adapted in a high degree. If the people wanted lib-

erty to be unhappy the present policies would satisfy them. As they want liberty to be happy, they must adopt new ones.

The theory of utilitarianism is doubtless so far socialistic that it requires the nation to attend to its own business, instead of leaving its business to be attended to by individuals whose economic situation makes, and must make, their interests opposed to that of the nation. Æsop, the wise man of antiquity, taught that when a man wants anything done well he must do it himself, and the policy of Æsop applied to nations is called *democracy*. Democracy has arisen because the experience of ages has taught that when a nation wants anything done well it must do it itself, and the policy of democracy applied to industry is called *socialism*. In other words, if the nation wants its industries operated in its interests, it must operate them itself, and in an age in which the well-being of all men depends upon the conduct of socialized industry, utilitarianism requires socialism.* In this, as in other respects, utilitarianism is the antithesis of commercialism, the latter being not only incorrect, but inconsistent; the former being both correct and consistent.

The first postulate of commercialism is that the business of a nation is to produce wealth. The second is that it shall not stick to business. *The first postulate of utilitarianism is that the business of a nation is to produce happiness. The second is that it shall stick to business.*

BOSTON, MASS.

* Tho utilitarianism requires socialism, *i. e.*, democratic socialism, it does not necessarily require the present Socialist party, for a Socialist party may fail to provide Socialism as successfully as a Republican party fails to provide Republicanism or a Democratic party to provide Democracy.

Standardized Industry

BY PROF. EDWARD ALSWORTH ROSS, Ph.D.

MR. MACKAYE'S translucent exposition of wherein consists the happiness of nations is right in line with the best thought of our time. There is hardly a big man in sociology who will not heartily agree with him. The clash between commercial and utilitarian policies is all about us. Instance the refusal to rescue the children from the factory and send them to school; the letting girls wreck their health and unfit themselves for motherhood in four or five years rather than pay a little more for ribbons or gloves or bon-bons; the opposition to the labor unions that are absolutely the only thing that stands between the workingmen and the aging, killing pace of work that more and more the employing corporation seeks to force upon them; the allowing of private interests to butcher the natural wealth of the Far West—under the name of "developing" the country—as they butchered the seal and the sea otter of Alaska; the willingness of good and conscientious men to let the wheels of industry and transportation redden and redden rather than pare a dividend in order to introduce safety appliances and methods; the reluctance to deal vigorously with alcoholism or deleterious adulteration or fake medicines, lest thereby we "hurt business."

I do not, however, conclude with Mr. Mackaye that the public cannot assert its neglected interest without taking over industry. What I think I see coming is an era of standardized private business when—over such area as still responds to competition—enterprises floating only standard securities, using only standard materials, employing only adult workers for a standard day, at a standard pace, amid standard conditions of safety and sanitation, will provide the consuming public with a standard product. Even within this harness there will still be left much room for the play of that ingenuity, progressiveness and efficiency which are so liable to vanish from a government industry no longer feeling the enlivening prick of competition.

MADISON, WIS.

The Elements of Vanity and Pride

BY PROF. FRANKLIN H. GIDDINGS. LL.D.

TO show clearly what goal nations ought to seek, and to persuade them to seek it, are two very different things. He must be an ingenious man who would find the fallacy in Mr. Mackaye's analysis of the conditions upon which the greatest happiness of mankind depends. And if mankind were rationally and persistently striving to attain greatest happiness, I think that it would not take long to bring the programs of statesmen and the efforts of the multitude into line with Mr. Mackaye's plan of operations.

Unhappily, mankind, strange as the proposition looks when printed out in cold type, is not at present seeking its greatest happiness. It is not, in fact, to any great extent interested in its greatest happiness. To be so interested, and systematically to aim at the utilitarian goal, mankind must first become rational, and I estimate that it will be some years at least before we shall arrive at the rational stage of psychological evolution. The vast majority of men is made up as yet of instinctive persons, imitative persons, superstitious persons, dogmatic persons, tradition-loving persons and convention-following persons, together with a large contingent of those interesting individuals whose characters were described by the lamented Mr. Joshua Billings as a concentrated essence of "pure cussedness."

Now, Mr. Mackaye, as an exceptionally intelligent person, will be among the first to acknowledge, I suppose, that a population composed in the main of unreasoning beings cannot be expected to regulate its conduct by a utilitarian philosophy. And, as a matter of fact, it does not regulate its conduct by intellectual processes, properly so-called, of any kind. If nations can be said to have "aims in life," as individuals are supposed to have—and I see nothing absurd in the assumption—it is quite clear that the chief aim in life of every important modern nation is simply to be "it," just as the chief aim in life of the average individual is to be "it." In other words, individual and nation are really thinking what they look like to their neighbors when they strut. The average man and his wife, and the average nation and her colony, are as yet in that stage of development wherein vanity and pride, manifesting themselves concretely in the passion to outdo others—not in the realities of achievement, but in appearance and glory — are the prime consideration. Moved by this passion, they are enraged when their claims are not admitted, and they are ready to quarrel or go to war when they are "insulted."

Because these are the real motives that actuate men and nations, they continue to follow the economy of commercialism instead of the economy of happiness. Wealth is power, and power is the wherewithal to swagger. There is, however, a simple and familiar economic law which assures us that one of these days they will begin to work out of the economy of commercialism and to work their way gradually into the economy of happiness, just as once upon a time they worked out of mercantilism into commercialism. It is the law of diminishing returns. When the forests have been destroyed and the coal mines worked to a standstill; when the nitrogen has been taken from the wheat lands and the birds have been annihilated at the demand of the milliners; when the labor of women and children has been exploited to the point of social degeneracy in order that a privileged class may lead lives of idle luxury, the world will begin to turn to the economy of happiness. Then some antiquarian will dig out of the archives this INDEPENDENT of July 4, 1907, and, reprinting Mr. Mackaye's article, will append thereto the all-sufficient comment: "What fools we mortals be!"

COLUMBIA UNIVERSITY, NEW YORK CITY.

Happiness More Than Pleasure

BY HUGO MUNSTERBERG, Ph.D., LL.D.

[Professor Munsterberg holds the chair of Psychology in Harvard University. He is a leading and much valued authority on philosophy, and has served, by his German book on "American Traits," as an intermediary between his adopted and his native land.—EDITOR.]

MR. MACKAYE'S brilliant essay on the "Happiness of Nations" is perfectly consistent: if the goal of the nations is the greatest pleasure of the greatest number of men, the economic creeds ought to be revised accordingly. He suggests that to reach such end the commercialism of the past ought to be transformed into a rational socialism of the future. Whether that would be the most effective form of the desired revision or whether the goal might be approached by other means is a problem which the economists might discuss. As a psychologist I have no need of entering into that discussion. My interest belongs rather to the presupposition itself: is it really true that the greatest pleasure of the greatest number is the true happiness of the nations and thus their real goal? The conclusion may be correctly drawn from the premises, but the premises seem to me entirely mistaken.

The whole utilitarian argument—as to which, on the whole, the commercialists and the socialists pretty well agree—is built on a psychological fallacy; pleasure and pain are taken as identical with happiness and unhappiness. Of course the choice of words is arbitrary, but we all mean probably by happiness the satisfaction of our demands. Now we must certainly have some discrimination between the satisfaction of our personal demands and satisfaction of our over-personal demands. Personal are all demands which refer to my individual welfare: my bodily feelings, all that wealth can bring to me, food and clothes, all personal enjoyment and health; but also fame and success and power. Only the fulfillment of these demands for one's own person is pleasure. But besides these personal demands we have others which do not refer to our personality, but to the world in which we live. The fulfillment of such over-personal or impersonal demands is happiness too, but this happiness is then not pleasure.

We all demand, for instance, that there be order and connection and consistency in the world; and that which fulfills this demand we call truth. That is no demand for ourselves, and truth is, therefore, first of all, not a source of personal pleasure, but an over-personal satisfaction—as the philosopher calls it, an absolute value. Of course such value may also, incidentally, bring us personal pleasure; the knowledge of the truth may be useful for our personal advantage or we may have a refined pleasure from acquiring the knowledge, but all that does not give to the truth its real meaning. The true satisfaction which truth brings is the fulfillment of the strictly over-personal desire for order in the world. But we have other such demands. We desire, for instance, that the parts of any whole may harmonize with each other: the fulfillment of this demand comes to us thru beauty. Of course here again beauty may appeal also to our personal sensations, may entertain and tickle us, but that effect on us is certainly not the meaning of a drama or a symphony: its value is over-personal. Or we may demand that the purposes and wills which we meet realize themselves in the world; this self-realization of the deepest will is what we call morality. Morality exists thus in the world again not for individual pleasure; the moral character has an eternal value; the moral deed fulfills an over-individual demand. Or we may demand that this world of ours have an ultimate unity, that truth, beauty and morality become one, and that the order of the world and the harmony of life and the self-realization of the will do not contradict one another: religion fulfills that demand and its meaning has again no reference to pleasure. The list of such

over-individual demands is much longer, but these cases may suggest already how our life abounds in fulfillments of desires which are not personal, and that means in happiness which does not come in question from the point of view of pleasure.

Pleasure is thus only a limited part of happiness, and the greatest pleasure of the greatest number is only a fraction of the happiness of the nations. The satisfaction of the over-individual demands, without reference to personal pleasures—that is the happiness that really counts, and that is the true grandeur of the nations. If it were otherwise, no economic policies were needed, as psychology makes it most probable that the sum of personal pleasure and displeasure does not change much by any scheme. Pleasure and displeasure are only relative; the average level may be low or high—pleasure and pain count only by distances from the level. The savages have as much pleasure and displeasure as we have, and the fishes in the water are not more unhappy than men. Every progress to comfort brings also new sources of dissatisfaction, and every new opportunity brings new disappointments. The Carnegies tell us everywhere that they had more pleasure from the first shilling than later from millions, and suicide for financial reasons is never committed by the poorest. Man's mind finds its biological equilibrium under any external conditions; from the standpoint of pleasure production, it was a wasted effort, what we call four thousand years of civilization and progress: eating and loving gave that just as well five thousand years ago.

But if true happiness belongs to the satisfaction of the over-individual demands, and is thus in itself independent from pleasure — however much the values and the pleasures may be intertwined—then the history of the nations has not been in vain. Not to gain wealth as a source of pleasure, but to build up systems of truth and beauty, of law and morality, of philosophy and religion, is then the purpose and the meaning of that endless strife; not to fulfil individual desires for pleasure, but to fulfil the higher demands for values, it was necessary to overcome savagery and to raise the level. History is truly without progress if the low happiness of pleasure is the goal; history is one steady progress if the goal is the higher happiness, the satisfaction of over-individual demands which lie beyond pain and pleasure.

But if life is to be viewed from that higher tower, economic activity too may take on a different aspect. Commercial activity which results merely from the personal craving for pleasure ought to lead, indeed, to some narrow regulation of all productions, and, finally, we may land at socialism. To be sure, even then it might be doubtful whether or not socialism would be too monotonous and would thus, by the pain of tiresomeness and emptiness, poison the new source of pleasure. But however that may be, it is evident that economics has a different meaning if the over-personal demand sets in; not our own profit, but the development of the resources of the world is then the ideal. Just as we seek order and harmony and self-realization and unity thru truth and beauty and morality and religion, we seek the development of the world of things thru the over-personal value of economic progress. Every step forward in production and distribution is then an absolute value, is a good in itself, worthy of the efforts of men. Nature is given to us as the material of our work; we have to bring it to its highest efficiency in human service; and to strive for that end is an ideal work not less than to create science and art and justice in the universe. That is the spirit in which the really great men of commerce and industry have always lived up to their task, which is trivialized when it is tied down to personal pleasure. As long as such an idealistic spirit is alive, utilitarianism and socialism cannot be the words of inspiration, if the true happiness of the nations is the goal.

CAMBRIDGE, MASS.

HERCULANEUM AS IT NOW STANDS.

Herculaneum

BY T. ASHBY, Litt.D.

*The Director of the British School of Rome.

THE name of Herculaneum, owing to the initiation by Professor Waldstein of a scheme for its excavation by international co-operation, has been much before the public during the last three years. The Italian Government has now decided that the work shall be done by Italian archeologists and with Italian money, and are of opinion that better results will be eventually attained by proceeding gradually at first than by commencing the enterprise on a large scale. Of that the officials of the Naples section of the archeological department of the Ministry of Public Instruction are no doubt the best judges, and we may fairly hope that, now that Italy has reserved to herself the right to carry out this important work, she will consider it a point of honor to commence it promptly and carry it thru to its completion, unless (which is improbable) preliminary investigations unmistakably indicate that the results of further work would not justify the undoubtedly considerable pecuniary sacrifices involved.

In the meantime let us, by shortly examining the history of Herculaneum and of the excavations which have already been made on the site, try to form an idea of what may reasonably be expected from it.

Herculaneum, according to our classical authorities, was situated between two

streams at the foot of Mount Vesuvius, on a hill overlooking the sea, with a harbor which was safe at all seasons.

Of its earlier history we know nothing; its name, of course, led to a tradition of its foundation by Hercules, on his voyage, it is said, from Spain to Italy. It was in all probability of Greek origin, and belonged successively, we are told, to the Oscans, Etruscans and Samnites. It fell under the power of Rome during the Samnite wars (Liv. viii, 25), and remained faithful until the Social War, in which it joined the Italian allies. It escaped, apparently, with comparatively mild treatment for its rebellion, and was much frequented as a resort by Romans of wealth, the imperial house being among the owners of villas there in the first century A. D. It owed its vogue, no doubt, to the beauty of its situation on the shores of the Gulf of Naples, sheltered by Vesuvius on the northeast, and easily accessible by the coast road from Naples, from which it is only five miles distant. In 63 A. D., however, it suffered considerably from an earthquake, which did considerable damage thruout the region between Naples and Nocera, and was very severe at Pompeii. As to Herculaneum itself, Seneca tells us that part of the town fell, and that the stability of the rest was none too secure.

We have a contemporary record in the shape of an inscription of the restoration in 76 B. C. by Vespasian of the temple of the Mother of the Gods, which had been overthrown by this earthquake. Only three years later the town was utterly destroyed by the famous eruption of Vesuvius, which overwhelmed Pompeii, in which Pliny the Elder, then in command of the fleet at Misenum, perished from suffocation at Stabiæ (the modern Castellammare), a victim both to his zeal as an observer and to his energy in rendering aid to the distressed.

MARCUS NORIUS BALBUS, THE FATHER. HERCULANEUM.

The configuration of the coast was entirely altered by this catastrophe. The rocky ridge on which the town stood—an

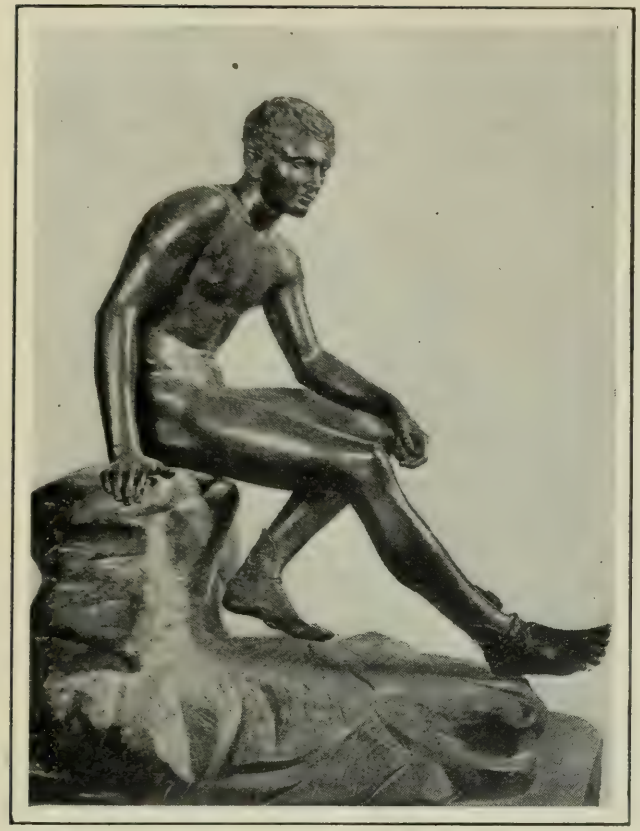
older lava stream, no doubt, and therefore the safest place for a settlement, inasmuch as subsequent streams might be expected to take the depressions on each side of it—and these depressions themselves have alike disappeared, and the coast runs in a straight line several

SAPPHO. HERCULANEUM.

hundred yards further out than it did before.

Herculaneum was, like Pompeii, overwhelmed by dust and ash, but the conditions under which they were deposited were somewhat different. At Pompeii the ashes remained almost entirely dry, and did not, therefore, solidify; but at Herculaneum, which is closer to Vesuvius, torrents of rain must have rushed down and mingled with the ashes, which were thus in parts consolidated into a

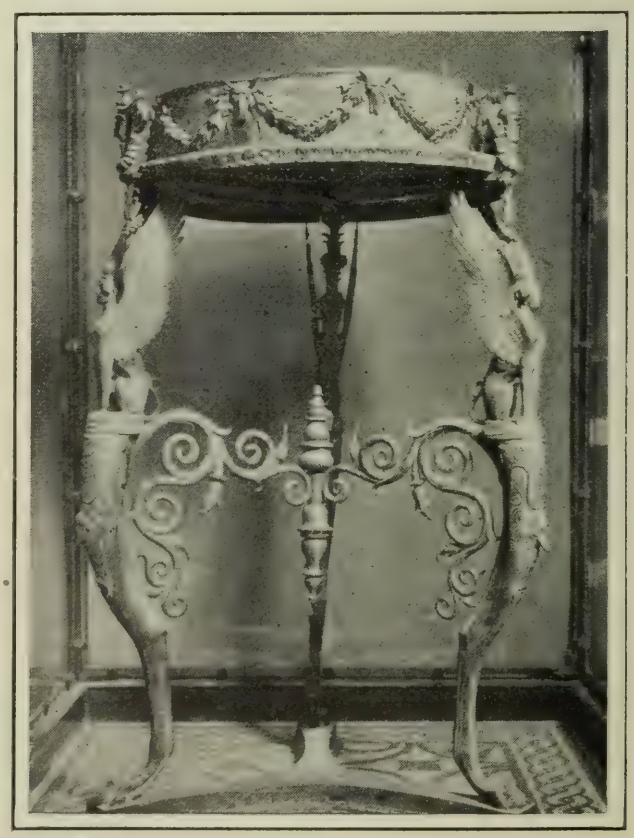


PLATO. HERCULANEUM.

harder mass, tho in parts they would be a good deal softer. Heavy rain acting on the materials thrown up in the spring of 1906 has produced precisely similar results.

The lava streams which are found on the site of Herculaneum are at a higher level, overlying the ashes, and belong to

ARISTIDES. HERCULANEUM.



CELEBRATED BRONZE MERCURY FROM HERCULANEUM.

a later eruption. Nor is there any basis for the supposition that Herculaneum was buried by a mass of volcanic mud, which would by this time have become homogeneous and very compact.

The history of previous excavations has been told by Prof. Michele Ruggiero ("Storia degli Scavi di Ercolano," Naples, 1885).

It is commonly but erroneously stated that the site of Herculaneum was absolutely unknown until, in 1709, the Austrian General, Count Elbeuf, accidentally hit upon the theater, his workmen being engaged in digging a well. As a fact he was actually searching for antiquities, and sank, not a well, but a shaft (the Italian word *pozzo* may mean either), with this purpose in view. The work continued for about five years, but was carried on quite irregularly, various points in the theater (which was not then recognized as such) being tried, and some portions of the buildings near it. Some statues were found, two of which (female portrait heads) are now in Dresden. In 1738 King Charles III of Naples commenced operations in a more thoro manner. The excavations continued for many years and led to the discovery of the true character of the theater, to the finding of what may be a part of the forum, of three temples, of a building with colonnades erroneously called a basilica, resembling the building of Eumachia at Pompeii, adorned with fine statues, among them those of the Balbi, of a few tombs, and of a large villa, in which were found the famous papyrus rolls, now preserved in the museum at Naples, comprising the library of the owner of the villa, a follower of the Epicurean school of philosophy. Here were also discovered some of the finest bronzes of the Naples Museum, such as the seated Mercury, the head of the bearded Dionysus, and others. In 1755 the King founded the Academy of Herculaneum for the investigation and publication of the results, and the magnificent work issued by this institution in nine folio volumes ("Le Antichità di Ercolano") caused a considerable interest in the learned world. Its publication began in 1757 and was completed in 1792.

Pompeii, however, was a good deal more easy to excavate, and the work there progressed somewhat faster. For, while at Herculaneum it was necessary

BRONZE TRIPOD FROM HERCULANEUM.

to work entirely by tunneling, at Pompeii the buildings of the ancient city could easily be laid bare in the ordinary way, owing to the lightness of the material with which they were covered.

It has sometimes been believed that the excavations of Charles III, tho not carried on with sufficient care, had at least crossed, with their tunnels, the whole area of the city. Professor Barnabee, however ("Atti dei Lincei," Sec. III, Vol. II, p. 751), is of the opinion that the area covered by these researches was not very extensive. Nor do we know with accuracy the extent and size of the ancient city.

The excavations were carried on for a while under his successor, Ferdinand IV, but abandoned in 1776, and not resumed until 1828. A group of houses was discovered at a depth of only forty feet, and the work was continued until 1855, with many interruptions.

It was not taken up again until 1869, when very little success was attained, and since 1875 practically nothing has been done except repairs.

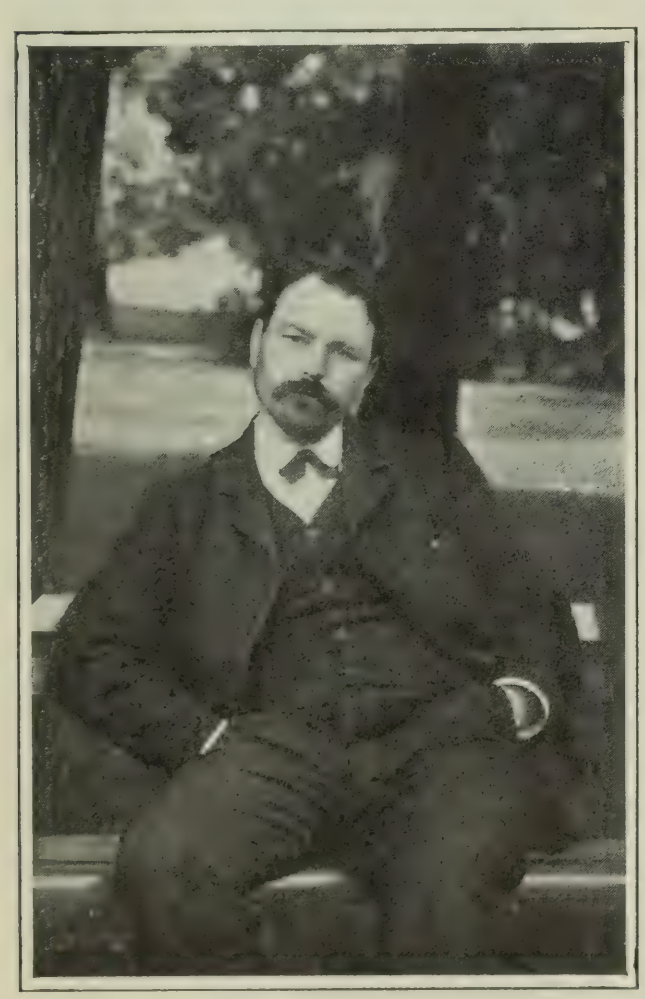
The work has always been carried on under considerable difficulties, owing to the existence of the town of Resina above the site, and the considerable depth of the excavations below the surface, necessitating their prosecution entirely by subterranean galleries, except in the case of the *Scavi Nuovi* of the nineteenth century. It has, indeed, often been the case that the materials from one cutting were simply used to fill up a previous one, instead of being transported to the surface; and the system of excavation led to the buildings themselves being often seriously damaged.

The theater is the only one of the buildings examined in the eighteenth century which is still accessible, and, faintly lighted as it is, its plan obscured by the buttresses which have been built to support the rock above, it is no easy matter to form an accurate idea of it. The so-called *Scavi Nuovi* of the nineteenth century on the other hand, only lie forty feet below the present surface and are open to the air. Here a street and several houses, the largest of them known as that of Argus from a painting found in it, have been brought to light. The street descends steeply toward the shore, which at that period must have been close by. A small portion of a group of public baths (*thermæ*) was also found, but it was not possible to proceed further with the excavation of it, as it lay on the edge of the area which belonged to the Government.

And so we come down to the present time. The expense of a systematic excavation of Herculaneum is such that the problem has never been faced until now; and it is clear that, if the quality and condition of preservation of the buildings and objects found is at all equal to that

HOMER. HERCULANEUM.

of those which have already been extracted from the ruins, the work will be of such surpassing interest and importance that to abandon it before its completion would be, to say the least of it, highly regrettable. But we may surely trust that the Italian Government, without prejudice to the considerable amount of other important archeological work now in hand or shortly to be undertaken in Italy, will not fail to carry thru this great enterprise which it has, exercising an undoubted right, decided to carry thru without foreign assistance.

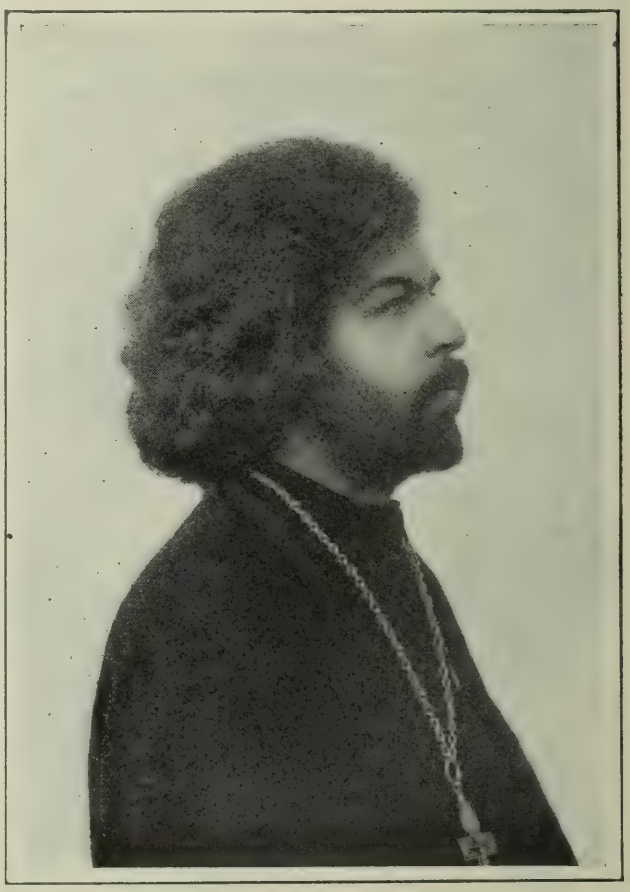


ROME, ITALY.

The Real Russian People at Church

BY WILLIAM ENGLISH WALLING

Russian Correspondent of The Independent



THE Czar and his Ministers continue to assure the world that the real Russian people, the hundred million peasants, are and always have been contented, loyal and devoted subjects. This is only the last example of the long campaign of slander against its own people that constitutes one of the worst crimes of the Russian Government. We know some of the infamies of the Czarism, but there is still a great deal of which we know nothing. Thru the rigid censorship of all the news at home, the systematic bribery of many foreign newspapers and the misrepresentations of officials on all occasions, it has been impossible to get at reliable and general information on the very questions that underlie all the rest; the actual conditions of the villages where four-fifths of the people live, the present development of the peasants, their attitude to the Czar, the Church, the officials, the landlords and the Revolution. With so little reliable knowledge we have been at the mercy of the statements of unscrupulous officials.

ANIKIN.

A peasant born and one of the founders of the Peasants' Party in the Duma.

"The people's representatives point out that the peasants are and always have been in a rebellious state."

GREGORY PETROV.

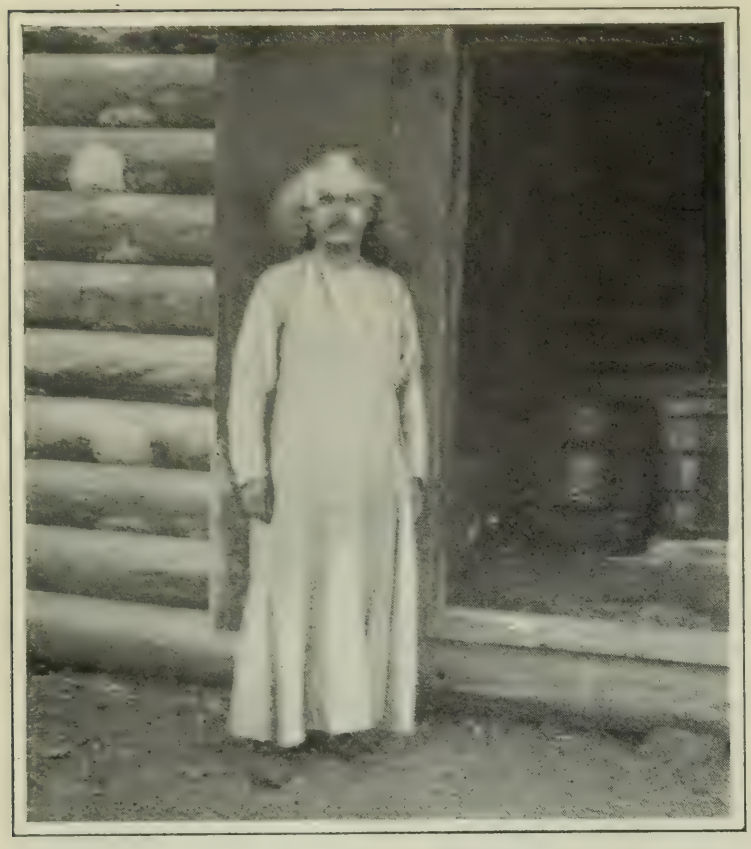
The famous and popular priest who was shut up in a monastery because he was elected to the Duma from St. Petersburg.

"Subjected to the police, even the relatively small number of priests who possess the attributes of spiritual leadership are powerless to assume it."

Since the peasants have twice sent Revolutionary and Socialist deputies to the Duma we have begun to get at the

truth. The people's own chosen representatives point out that the peasants are and always have been in a rebellious state, that the history of the Russian peasantry has been that of an unending series of revolts and that the only reason a revolution has not yet overturned the Government is the terrible brute-power of the half million semi-foreign Cossacks that guard the Czar.

We would have small sympathy with a people that had so little manhood and so little love of freedom as humbly to submit to the curse of a Czarism. To the degree to which we believed the official statements that Russian people were loyal and contented under that system, we were ready to believe, also the other attacks on their character, that came directly or indirectly from the same quarter. Before the peasants had an opportunity to voice themselves in their national parliament, their enemies, the officials, had already succeeded in implanting in the consciousness and literatures of foreign nations a vague and indefinite but none the less obnoxious picture portraying them as a dull and indolent race, ignorant, hard drinking, fanatically religious and stupidly devoted to the Czar.



In Russia itself the Czar's defenders carried their attacks on the peasants' character so far as to reduce them to absurdity. As patriotic Russians they pretended, of course, that most of the shameful characteristics they attributed to the people are, after all, virtues, and that the key to the peasants' psychology, the greatest of all virtues, is self-renunciation! This is "the highest expression possible to the human individual," since it makes of him the perfect subject of those divine Russian institutions the absolute Czarism and the "changeless" Church.

According to the professional Russian patriots or Slavophils, whatever is Russian is right. But the peasants of Russia are both poor and illiterate. Are their poverty and lack of education also part of the "highest expression possible to the human individual?" The late head of the Holy Church could well give an authoritative answer, since he was also the most venerated adviser of both Alexander III and of the present Czar. That terrible old man (Pobiedonostsev) opposed general education along with newspapers and everything else that might develop the slightest spirit of freedom. He developed his ideas to their logical conclusion and fearlessly announced, to a world that still refuses to believe its ears and does not yet realize the full monstrosity of his doctrine, that "inertia is the fulcrum of progress" and "poverty, lowliness, depravation and

"The people loved these forms as they were and believed they had a God-given right to them."

THE SAME VILLAGE PRIEST OR "POPE" IN HIS EVERYDAY CLOTHES.

"Economically dependent on the poorest peasants, who often find they can make a better bargain in proportion to the amount of vodka they can persuade him to drink."

self-denial are the true lot of man." Such are the ideas that have ruled and guided the present Czar!

This "official character" of the peasants has been so long and so variously repeated that it has influenced even the most liberal foreigners. The monumental work of a well-known French publicist, Leroy Beaulieu, like that of a host of other writers, is marred by continued reference to "mysticism," "fatalism" and "passive endurance" as the chief traits of the peasant's character. Yet may not such passive qualities, as far as they really do exist, be simply the temporary results of oppression? Mysticism may arise from the very keenness of the desire for a rational explanation of life on the part of those to whom knowledge is denied; fatalism may come from the intensity of frustrated longing for a better régime, passive endurance from the futility of resistance to a stronger physical power. Leroy Beaulieu himself acknowledged that he had only spoken of negative qualities, for he found it impossible at the time he wrote to give an estimate of the peasants' "actual creative power." But it is precisely this positive creative power that we want to understand.

The real character of the peasant has remained a mystery. He constitutes the great unknown element of the white race. He is the most interesting human problem of the time. If his nature is undeveloped it is in the same proportion unfixt and unspoiled—in other words, that of the generic man. He will come to his majority in the twentieth century more freed from tradition than our own pioneers in the nineteenth. The Russian Revolution that is bound sooner or later to end in his favor will not only make him master of half Europe and Asia, and revolutionize the relations of the world powers; it will decide the fate of every democratic movement on the Continent and give a new inspiration to the international movement for economic equality.

It was because he was unfree that the peasants were something of an unknown quantity, even to his most educated and progressive compatriots. But since the first meeting of the Duma their pent-up opinions and feelings, finding their first general outlet of history, have burst out in unmistakable clearness. It appears, in contradiction to everything the Government has claimed, that the peasant is everywhere in a rebellious state, either against the officials or the Czar; that he is a democrat in everything and a socialist with regard to the land; that he is almost without race prejudice and liberal and even independent in his religious views. Yet there can no longer be the slightest doubt; the two elections are substantiated by tens of thousands of village meetings endorsing the action and attitude of the people's representatives and by thousands of cases in which the peasants have gone to imprisonment, exile and death for supporting these same opinions.

It seems that the spiritual, if not the

physical, resistance of the people has risen proportionately to the unreason, injustice and violence of the ruling caste. Instead of devotion to the Czar there reigns in the mind of the peasant a supreme indifference to the spirit of his laws and an almost equal indifference to the authority of his Church. In this the Russian is removed at once from the subserviency of the German peasant before his officials and that of the Southern Italian before his priests.

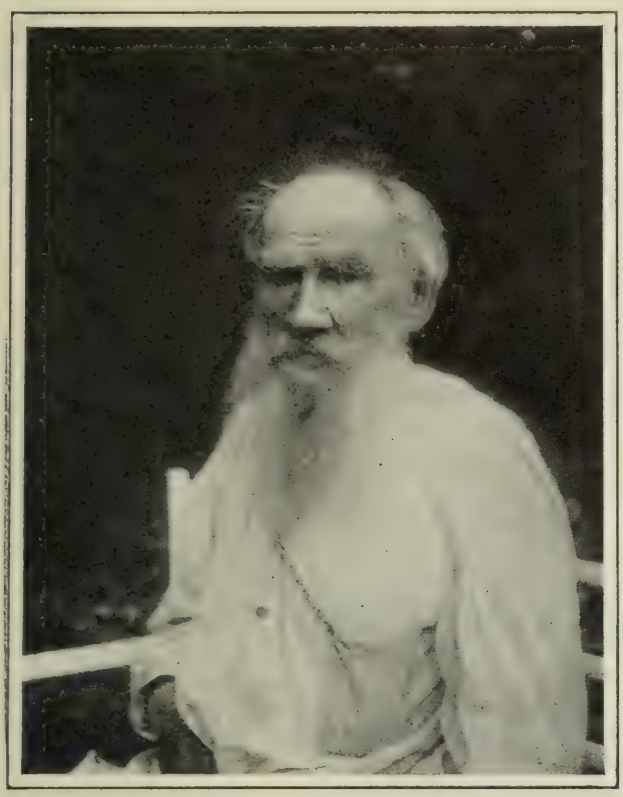
There could be no greater contrast than that between the position among the people of the Roman Catholic and the Greek churches. In both the popular religion is another thing from the religion of the heads of the Church. But the popular saints, the real spiritual power of both churches among the peasantry are not in Russia, as elsewhere, simply lesser gods, less powerful than the Deity, tho equally remote and mysterious, they are actual, everyday peasants. In the innumerable legends about their doings they are made to behave themselves not as superhuman saints of the Catholic peasantry, but as all too human Russian mujiks. St. Nicholas, the greatest of them all, is simply an infinitely shrewd and kindly old "mujik" who nevertheless often gets the better of Christ in their little arguments and lives on by no means subservient terms with God.

The story of the origin of the Russian Church gives the best symbol of its position today. Before their "conversion" to Christianity the ancient Slavs had a very simple and flexible form of belief. They were not idolaters nor worshipers of many gods, they had no priests, and their cult was limited to that of Svarog, the God of heaven and light, certainly a rather spiritual deity, who might well symbolize the universe and its life, and to a lesser degree to that of his two children—fire and the sun — also not very earthly divinities. The Emperor Vladimir, descendant of one of the Norse conquerors of the land, was impressed with the glory of Constantinople and the Greek Church, and proceeded quite in the scientific spirit to send a commission to study it and the other Christian Churches. They returned overcome by the beauty of the singing, temples and service of the Greeks. They seemed consciously to be seeking beauty of form. They complained that they found no gladness among the Bulgarians, and no beauty in the temples of the Germans, but among the Greeks they found such beauty that they knew not how to tell of it; they no longer knew, they said, "whether they were in heaven or earth!" "It is there," they reported, "that God dwells among men, and their service surpasses that of any land." So on the

A Celebrated French Artist's Sketch of Onipko, a Peasant Member of the First Duma.

Now exiled to Siberia for life, and a popular hero and martyr. "The peasants go to imprisonment, exile and death for their opinions."

strength of the beauty of its service, its temples and its singing, and in return for the hand of a princess of the Eastern Empire, Vladimir was baptized, and gave up his promising design of capturing Constantinople, which, if accomplished, might well have transformed the history of Europe and the world. No sooner was he Christianized than, with the true gesture of a Czar, he ordered his people led to the rivers and baptized. So was Russia converted to the Greek Church.



In the same spirit a law among the statutes today requires every Russian citizen who does not belong to some other "recognized" creed to attend at least once every year the orthodox service. Innumerable other enactments of the kind have followed without interruption since the time of Vladimir's baptism, and naturally without any spiritual effect. As in the earliest days also, the priest does not enter seriously into the peasant's life. In some parts of the country he is not deemed strictly necessary even at the marriage ceremony. In a certain village where the priest offered to charge too high for the christening, the peasants proposed to carry it thru without his aid. The priests are nearly always paid in kind for each service, and so are economically dependent on the poorest peasants, who often find they can make a better bargain in proportion to the amount of vodka they can persuade him to drink. The priests are the political agents of the Government and the peasants do not fail to feel and resent it. They received full instruction, for instance, as to what they were to say about the Duma. The outraged peasants replied by ceasing to go to church, by refusing to do any labor for the priests, and even in some cases by proposing thru the village meetings to take away their land. Subjected economically to the peasants and politically to the police, even the relatively small number of the priests that possess the attributes to assume moral leadership are without the power to assume it.

"In the sombre villages the most beautiful or least ugly spot is the church."

In what then does the peasants' orthodoxy consist? In the first place he has shown an unconquerable tendency not to be orthodox at all but to do his own religious thinking. When several centuries ago another of the Czars appointed a commission to study again the original forms of the Greek Church, which were supposed to have degenerated and proposed new ceremonies accordingly, he was met by a variety of passive resistance as obstinate and successful as the world has ever seen. The passive resisters, the "Old Believers," were satisfied with the "Slavic" Church and the forms they had themselves developed,

The "Old Believers" were not a sect, they were simply the more obstinate fighters amongst the peasants. The people were fighting for what has always

"It is enough to remember that Tolstoi has confessed his deep indebtedness to both Molokhani and Doukhobors."
(An unpublished photograph taken especially for my use at the time of my visit to Yasnaya Polyana in 1906.)

drawn them to the Church as it drew the commission of Vladimir a thousand years ago. In the somber, isolated and often starving villages of the forests and steppes the most beautiful or least ugly spot is the Church, the most interesting occasion its service, while its singing is a real source of inspiration and delight. The genius of the people, working thru the Church, has developed an original and truly beautiful music that is a light in the peasants' lives. The people loved these forms as they were; they considered they had a God-given right to them. The Czar, "absolute" as he was, had gone beyond his powers and they refused to allow his interference with the innocent consolations of their village life. The Czar, on the other hand, realized that one freedom leads to another and has claimed with equal obstinacy until today that God, having entrusted him with the absolute mastery of the peasant bodies, has also made him the tyrant of their souls.

A large portion of the peasants still go to the Czar's Church, but they do not obey his priests and they have developed a morality of their own making. Another large part have not been deterred by the most terrible persecution from creating a religion also after their own ideas. The tendency to break away altogether from the priests is general. A large part of the "Old Believers," especially those who settled in outlying districts where priests were difficult to obtain, decided finally to do without them altogether. The idea spread all over the country, and, of course, led these "priestless" ones, as they are called, to do their religious thinking for themselves. The result is, perhaps, as large a body of sincere and rationalistic religious thinking as is to be found among the people of any land.

But the religious evolution did not stop here. It has continued and grown with the increase of education and travel,

POBIEDONOSTEFF.

and the new life and occupations of the people in this already half-modernized country. Along with a revolution as profound as the French, is going on a popu-

lar religious reformation comparable only to the peasants' movements of Luther's time. The "priestless" schism still retained some of the external features of the Greek Church. The peasants have also created systems of new religious belief on an entirely independent basis. The subtlety, simplicity and dignity of these beliefs has charmed and even won many of their observers. It is enough to remember that Tolstoi has confessed his deep indebtedness to both the Molokani and Doukhobors. Tho they are still in process of growth and development, their adherents are already numbered by the millions. The Government is straining every nerve to hide conditions that promise to undermine the very foundations of the old régime. Minister Stolypin has again assured the world and the second Duma with the full approval of the Czar, that it is the Imperial Church that has constituted "the chief source of the spiritual power of the people." A moment later he mentioned as subject to possible amendment the law by which the conversion of any member of the Orthodox Church to another faith has been met by the severest punishment until this very day.

Such are the barbaric means by which alone the State Church has managed to maintain itself in mere existence. Can we believe that the Czars have been able to create spiritual power by physical violence?

The Last Buffalo Hunt

BY THE REV. THOMAS L. RIGGS

[Mr. Riggs, a missionary among the Dakota Indians, who has talked their language from childhood, was the only white man who was a member of their last hunting party. He went for the love of it and to study their customs.—EDITOR.]

THE Dakotas of the plains had their last winter hunt in 1880-81. Buffalo left the Valley of the Missouri some fifteen years before and now turned back toward their former feeding grounds to escape the inexcusable slaughter by white hunters on the north.

Early in September, 1880, reports of returning game were brought to the river agencies, and several hunting parties went out. I accompanied those going from the Cheyenne River Agency. Our route was up the Moreau River and to the west of Slim Buttes. There were sixty hunters and forty women in the party, with innumerable dogs and three hundred horses, and we brought home about two thousand robes. Indians from the Custer battlefield of four years before made a considerable portion of the party. Being the only white man along, I was able to study their habits and language; this, indeed, was my chief object in accompanying them. This is a partial account of this hunt, and gives an inside view of the customs and laws that control all hunting parties of the Dakotas when out for big game.

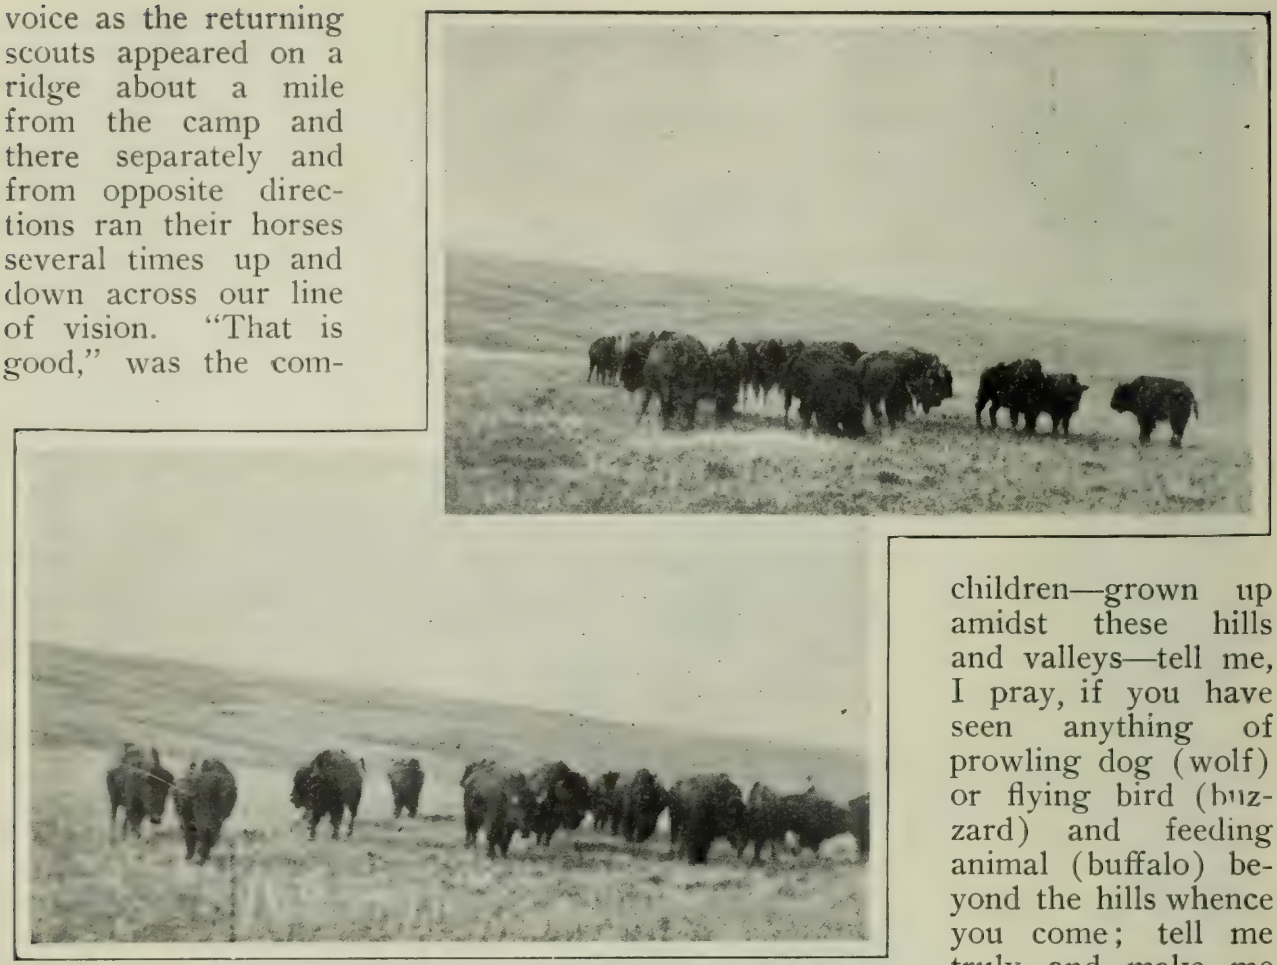
Roan Bear and I had turned out our horses with the bunch in the breaks, where they would paw away the snow and feed during the night, when he proposed that we go to the "soldier lodge," or council tent, and learn what was to be done. There had been talk of sending men to the hills, for we were now not far from where big game might be found. The soldier lodge was like other tents, tho larger than most, and stood in a sheltered spot not far from the middle of the camp, which was pitched on the south side of a fringe of trees and brush. In one respect, however, this tent is quite different from others—there is none of the usual trappings of travel around the door nor any ordinary signs of cooking and home life inside. No woman lives there. Food is brought from other tents. This lodge is the heart of the camp, and levies on all for voluntary contributions. Here all general matters are discussed and plans made.

When Roan Bear and I went in we found Little Bear and one or two others only. These were seated at the left as we entered. A carefully tended fire in

the center made the tent warm and light. By the fire there was a kettle or two of boiled meat and a large iron pail of coffee. Little Bear had his pipe, and this was passing from one to another.

As others came in they seated themselves in a circle about the fire. We had but one topic; yesterday a young man had seen what appeared to be the drifted over trail of a single buffalo, indicated by the broken bits of snow, and today others had seen similar signs, and just before we made camp these were found plentiful and sure.

No shooting had been allowed for two days, and even loud talking and the barking of dogs had been repressed. It was three weeks since we started, and the camp was well in hand and under strict control.



It was thought best not to move camp the next day, but to send out scouts in the morning. Two young men of experience were selected for this service. They were to leave camp before daylight and were carefully instructed as to their route. Keeping together, they were to go to certain well-known landmarks; if nothing be seen from there or on the way they were to go to other specified points of outlook, and, returning, bring report. These instructions were given by the leading man, he who stood as chief of the council tent; he was assisted by others and all was said in the hearing of those present. The selected two were sworn to the service; each, with one or both hands placed palm down flat on the earth, received the instructions and made silent pledges. There is no fixt form for this oath, nor is it given aloud. The solemnity of the occasion and its serious purpose is felt and responded to by each. Many others also joined in this vow and prayer. I sat next to Touch-the-Cloud. He rubbed away the grass and leaves at his side and sat with one hand flat on the earth. Seeing that I was noticing he said: "I am offering prayer with one hand and I now do so with both." I did the same. The earth is the mother of all and prayer is offered in this way, as the oath is administered, lest the all-mother give alarm to the buffalo and carry to their ears knowledge of the presence and purposes of men.

A YARD OF PONIES.

Life in camp the next day was anxiously dull for most. Our scouts went out as ordered. The very horses taken were known. Each rode his second best —not his buffalo runner. As the day passed interest grew and guesses were made regarding when to expect their return. I learned several interesting things: Going out to scout for buffalo is spoken of as "going to the hills"; if returning with glad messages the scouts would be "the runners," from the way in which they would make known what their report would be on the first convenient hill at a distance from, but in sight of, the camp. "What do you call them when they have no message, if they come back and say there are no buffalo?" I asked. "We shall not see them at all if they have nothing to tell. They will not come back till after dark and then even the dogs of their own tents will not know when they return." I thought this rather hard on the poor fellows. It occurred several times, however, on this very hunt. No one knew when the men sent to the hills returned, and even the next day they had but little to say save in answer to questioning.

It was just before sunset that our "runners" came into view. Some one announced the fact and the entire camp went wild—women calling and men running and everything about the tents forgotten as we looked to see the message they were bringing. "They run! they run!" every one shouted in suppressed

BUFFALO FEEDING.

voice as the returning scouts appeared on a ridge about a mile from the camp and there separately and from opposite directions ran their horses several times up and down across our line of vision. "That is good," was the comment made by Charger. From there our runners came full tilt to a second rise nearer by and repeated the maneuver. "We shall have plenty of fresh meat by this time tomorrow," said Yellow Owl, a brother of Little Bear. A third time the runners gave the signal when but a short distance from camp, and then rode with all the speed their tired horses had left directly to a little knoll to one side, where the camp crier and others had gone to receive their report. We gathered facing the west, for the runners were coming from that direction. Each man brushed aside the snow before him and kneeled on one knee. The old crier had gathered a few dry buffalo chips and piled them before him. Straight to him the runners came; jumping from their horses, the leader kicked the little pile aside, and both knelt opposite the crier and facing us. The crier lighted a pipe, took a whiff himself, and after reverently touching the earth with the bowl and lifting the stem to heaven above, he presented it to the leader and said: "You who are no longer children—grown up amidst these hills and valleys—tell me, I pray, if you have seen anything of prowling dog (wolf) or flying bird (buzzard) and feeding animal (buffalo) beyond the hills whence you come; tell me truly and make me glad." The runner having received the pipe and in turn offering it to earth and sky, takes a mouthful or two of smoke, and passing the pipe to his comrade, answers "Yes." The expectant crowd from camp give voice to a shrill cry of exultation: "Hai——i! Hai——i!" The crier repeats his question, calling now for particulars. Answer is given presenting what they first saw. Again is the charge given and more of the particulars "from beyond that" asked for. And even a third time is the call made for what is "beyond that." After this the runners are told to tell at will all they have learned. The official report has been made and now all rise and the runners give with more of personal detail the news they bring, while some skurry down into camp to tell the women and to prepare for the run to be made the next day.

The hunters were out early—fifty-six men of us—and, leading the horses they were to ride, with a number of extra pack horses along, soon after daybreak approached the place where buffalo were

THE LAST HERD.

seen the day before. As we could see each other more clearly, I noticed the blackened faces of those who had been appointed "soldiers" for this run. This was the sign of their authority, and it was their duty to keep the party together and to stop any ambitious hunter from starting away and alarming the game before all could take part on even terms.

The morning was gray and chilly—the day before Christmas—and Cokantanka expressed my own feelings as he rode up to where we were stopping with a shivery "I'm cold!" He added, after a look to the east: "We shall all be warm soon and without the sun." The snow was deeper than the older men liked and many falls were predicted, tho several remarked that there would be fewer bones broken because of this. The buffalo were not far away and some were soon seen, but the herd was very small and there was considerable talk before it was finally decided to run these. We were tired of venison, porcupine, skunk and badger meat, and every man longed for the food of former days—buffalo meat, "the meat that satisfies and has tang to it."

We changed mounts, taking our running horses—the pampered ones that had run loose all the way out and at every opportunity were fed the strength-giving shavings of the inner bark and the twigs of young cottonwood trees—these were the horses on which we now depended and about which we had bragged mightily night after night. A few of these were experienced buffalo runners, of known speed and staying power, but there were many untried horses. My own was an old hand and knew all that horse could know about running buffalo, besides being very fast. Every man in camp knew him, for he was the horse that Can-pta-ye had on the Little Big Horn against Custer in '76. Some men rode bareback, but the most of them used a convenient, lightly stuffed running pad. I had added stirrups to the Indian-made article I used.

While changing to our running horses a consultation was held. During this one of the quieter men of the party led his horse to one side and, with covered head, seated himself on a slight rise of ground. Joining us again he said: "I have been praying that we may have a successful run and that no one be hurt; my heart tells me we shall soon eat fresh meat." Starting again, two or three were to keep along on the edge of the little plateau beyond which the game was feeding quietly, and by signals keep the main body posted as we made a detour and followed

up a long, crooked depression to get close in before showing ourselves. There had been excitement before, but now it was intense, affecting horses as well as men. Some worked along quietly, making no show of their eagerness. Many of the men rode like demons, recklessly using heel and quirt to key their horses up to the rush they would soon have to make, and a few of the horses were equally wild. For weapons we had magazine and single-shot rifles, tho Little Bear, who rode a famous Pinto horse, an old-time hunter, carried his bow and arrows. To prevent losing one's horse in case of a fall each man had a small line, about 20 feet long, tightly tucked under his belt, one end of which is fastened to the bridle bit and the other tied to the belt itself. When this has not been done horses have been known to get away and never be recovered. My own hands, on this first run, were very full. I, of course, was as excited as any, and it was all I could do to control my horse, who would first carom against the man on one side and then against him on the other, much to my discomfort and deep anguish of soul, for in the midst of it my line slipped from my belt and flew away behind, a most tempting loop—horse on one end I on the other—for some one to step into and I be jerked off and covered with snow! To pull in, recoil and tuck away my line was nerve-splitting work at the moment, and my heavy Remington was extra trouble—I could easily have used another pair of hands. A laughable occurrence eased the strain somewhat. One of our "soldiers," who had been left with the main party, was very suspicious of those who were doing scout duty above us. He declared that they were deceiving us and were not to be trusted, and as we could see nothing whatever, he finally started off in a hurry to see for himself, running his horse over a little rise and down into an open draw leading out of the valley. Suddenly there was a cloud of snow, and both man and horse disappeared. The man rose uninjured, and, after much effort, helped his horse from the snow-covered washout into which he had ridden. As he turned back, shaking the snow from inside his clothing and clearing it from his gun, Roan Bear whispered loudly enough for all near to hear: "He is cooled off now," and we trotted up the valley with better hold on ourselves.

The head of the valley brought us out on a bit of level country. We turned to the left, and hardly eighty rods away the already startled buffalo closed up and began to move, giving their stumpy twists of tails an upward flirt as they broke into a lumbering gallop. I hardly saw them except to note that they suddenly vanished as if swallowed up in the earth. The first wild burst of the chase left me off to the right, and for a moment I thought a trick had been played on me. In a flash my horse is running like the wind in the rear of the silent, hard-whipping riders. These disappear as unexpectedly as had the game a second before, and now I reach the edge of a steep-sided, flat-bottomed water course, to see the buffalo climbing out the opposite side and scampering away, while in the valley before me my comrades are strung out in most disorganized style. Under the snow there is a wide sheet of ice and probably twenty horses are down and their riders in all positions of falling and quick recovery. A few are across the ice and some are slowly making their way over, while others are picking themselves out of the snow, helping their horses up and taking stock of damage done. It is a most impossible sort of drop-off, and I would give all I have to be able to pull up on the brink. My horse will not have it so, and with my heart well up in my throat we go over and are across with the fortunate ones before I have time to think of the next thing to be scared at. Indeed, I have now drunk deep of the wine of the mad chase and would not stop at anything! The run is well on and the leading hunters begin to shoot; those on slower horses far in the rear also begin to shoot, much to the disgust of those in front, where man, horse or buffalo stands an even chance of being hit. A good horse, a magazine gun and an open prairie is all that ordinary man needs with buffalo afield. Formerly a cut-off smooth bore flint-lock was the weapon; the hunter carried his bullets in his mouth and dropping a ball in on the powder, poured by guess from the horn as his horse raced warily along to the right and slightly in the rear of the game, he rapped the butt sharply on his

thigh to settle the charge and prime the piece, and was ready for his shot.

This first run of ours allowed but one lone buffalo to escape. We packed back to camp the meat from fifty carcasses. One of these was killed by Little Bear with his bow in the way of his fathers. The arrow was driven entirely thru the body, entering the right flank and its steel point sticking out low down on the opposite side. In former days this was often done, but it requires great strength of both bow and arm. Usually several arrows were necessary, and often the game would run for miles after being hit in a vital spot. When the buffalo falls the hunter, if on a swift horse, does not stop, but passes on in pursuit. Those on slower horses, especially the relatives of the possessor of the swift one, follow, and soon skin and cut up the animal, selecting dainty morsels of liver or the belly fat for quick lunch as they work. To each of these, in the order of his coming up, belongs a definite portion. To the man who ran and shot the game, the hide and one side of the meat belongs. His first assistant has the other side, and the second assistant comes in for the brisket and other parts. These three make the ordinary complement, and they are spoken of as "first," "second" and "third killer" respectively. Should a fourth man render assistance his share is as shall be given by the others. Often disputes occur over who killed the animal, and sometimes quarrels and bad blood result, but there is never a question regarding the law of division.

On most hunts there is more or less stealing of game. The relatives of a prominent man, coming upon a slain animal, claim it as the spoil of his gun and horse and swear the rightful owner out of court unless it can be shown that his bullet reached the vital part. The size of the bullets or some special markings of his ball often give conclusive evidence. This practice, universally deplored by the Indians themselves, is fully recognized in the saying often heard in a buffalo camp: "The slow horses get all the buffalo!"

When the work of the field is over the extra horses are packed with the hides and meat, and some astonishingly heavy loads are carried, tho but little of the bone of the animal is taken, and the hunters make their way back to camp. It is not always that the labor of the day ends as you leave the field.

You are tired and hungry, for it is usually ten or fifteen hours since you left camp, and there are yet weary miles of return. One night our party struggled with the drifting snow and the long distance we had come till near daybreak. Not being equal to raw liver I was terribly hungry from the twenty-two hours' fast and the strenuous life of the day. Many were the stories of trouble and difficulty told the next day. Touch-the-Cloud said he of all the party had been the most unfortunate! Some one else claimed this distinction for himself, and a show of experience was called for.

THE ENCAMPMENT.

The meat on one of Touch-the-Cloud's pack horses would not stay put, but kept falling off into the snow every few steps, and he had been busy all night finding the lost and fixing his pack. His competitor killed an enormous animal and threw the green hide over his horse, sitting thereon. The hide froze as stiff as marble, and in passing thru the deep drifts he was lifted clear off his horse, "the stiff-necked one," which past out from under and left him straddling the frozen hide on top of nothing. Number two was awarded the claimed distinction, the absurd helplessness of his condition appealing to all listeners, and to this day

—a quarter of a century later—his story is told over and over by hundreds of Indians.

Two men were left one very dark night to drive the pack horses while the rest of the party went to the assistance of one of their number who was in trouble. There was a great ungainly mule, belonging to Big Foot, who was afterward killed at Wounded Knee, that was overloaded, as were all the poor beasts. Whip as they might, the young men could not make the mule keep up, and finally what does he do but lie down! The pack is taken off, piece by piece, the mule kicked and whipped into position, and the pack replaced. In a short time this is repeated, and again and again repeated till the men are worn out and in despair.

One of the most reckless acts I ever knew of on a hunt was a run in the dark and the shooting of game by Co-kan-tan-ka on a night when even the stars themselves had gone to sleep. We were working toward camp with extra heavy packs when out of the darkness there came what appeared to be an abrupt bank or wall, but was an immense herd of buffalo moving diagonally across our line of travel. With but the word, "I make a night run," Co-kan-tan-ka left us and in a moment we saw the flash and heard the report of his shot. Then another and another followed, and for fully an hour we heard nothing more from him, when he hailed us and the men went to his help. He failed with his first shot, and as the sense of his awkward position in the midst of the madly running buffalo came to him he lost himself, and in his hurry he jammed the lever of his gun hard up and fired the piece in air. This was repeated and now his magazine was empty. With the running buffalo bumping into his horse and rubbing his own legs on both sides, he reached back for a cartridge from his belt by the time this was in place he had control of his nerves, "picked out a fat cow" and fired. The first three shots were all that we heard. Even after the successful shot he was carried by the herd a long distance before he could draw to one side and be free to return to his game.

Back to the camp we come with an abundance; the fires crackle and the pots are boiling, and all are smiling and happy. No one is injured and the hides will make the finest of robes. There are disappointments, to be sure. Some horses of which much was expected turned out poorly. Charger rode a big blaze-faced brown that ran splendidly till he saw the strange-looking woolly beasts with their wagging chin whiskers, and then he bolted and ran away in the opposite direction with his unwilling rider, nor was he stopped till two miles away. Roan Bear had a little black from which he expected great things, but which failed to make good.

And so the talk of the camp came and went. The dogs that came from home lean and scrawny grew sleek and fat. A few of our horses succumbed to the hard work and the deep snow. Coffee and sugar became a thing of the past and flour was a memory. The older Indians cared not for these, but with the loss of the tobacco there was wo and sorrow. Little Bear cut up, shaved thin and powdered in the palm of his hand, his old nicotine-soaked pipe-stem that he might smoke it in a borrowed pipe. "I can stand hunger," he said, "and thirst, but without tobacco I am dead!"

This is a sketch of a winter hunt for big game as the Dakotas have followed it for generations. It was their last winter hunt. They prepared for this, entered upon and carried it out with religious feeling and fervor. Much that is good of their ancient religion shows in every detail. Spies are sent afield and their reports received under oath and according to a ritual of thought and form that is fixt and handed down from generation to generation. The ordering of the chase itself and the sharing of the spoils is clear-cut and invariable. The hunting camp is a unit and the crier stands as representing the camp—its recognized spokesman and its high priest.

All this is now of the past. The buffalo have departed. The wandering Indian of the plains has also gone. We now have him slowly accustoming himself to his changed environment. There is good stuff in him and much hope for him.

Oahi, South Dakota.

Literature

Efficient Democracy

To secure efficiency combined with democracy is one of the cardinal problems for American citizens. Each year the organization of production in mines, mills and factories becomes more efficient, the output per workman is increased. In recent years the organization of office work also has been revolutionized. "Business doctors" have undertaken to examine the methods of well-established firms, to detect weaknesses and leakages, and to show how the amount of their own enormous fees and something besides could be saved. Railroad accounting and the bookkeeping of trusts have been reduced to a science, by which the president can tell any day exactly the financial position of each department and the achievements of every manager. But many establishments have not yet sought the aid of the new-fangled business doctor nor installed a brand new set of ledgers, card records and cabinets. We are not surprised to learn from Mr. Allen's book* that among the laggards are the philanthropic institutions and the government departments of our cities and States. The writer, who is the aggressively energetic general agent of the New York Association for Improving the Condition of the Poor, is doing a public service by prodding the responsible persons and by demonstrating that a more intelligent set of records would probably increase efficiency. His work is vigorous and suggestive, worth the attention of the officers, paid and unpaid, of charitable agencies of all kinds and of our governments. The same ideas are repeated in different chapters of the book, but as most readers will peruse only the sections dealing with their specialty, this defect is not so serious as it would be in a work essaying a continuous argument. Undirected and misdirected benevolent impulses are common nowadays, and the wide circulation of Mr. Allen's book would do much to check waste of money and energy and to prevent the discouragement which comes from the failure of good intentions.

Did Mr. Allen claim a little less for his method his persuasion would be more effective. By making it appear that well nigh all the ills that flesh is heir to are curable by statistics he calls to mind the quack with his infallible pills. Now, figures are doubtless valuable when accurate and expertly interpreted; but too often statistics are the superlatives among liars. It is no more easy to get efficient statisticians than efficient managers or honest politicians. The limits of capacity in those who must fill in his elaborate returns Mr. Allen also too often disregards. Recently the chairman of one committee of the New York City Board of Education—a body which comes in for some of Mr. Allen's castigation—

WILLIAM HARVEY ALLEN,
Author of "Efficient Democracy."

* Efficient Democracy. *By William Harvey Allen.* New York: Dodd, Mead & Co. $2.00.

tried to improve the system of accounting in the store department. Economies were accomplished, but the ideal of this book was found quite unattainable for the simple reason that the clerks, thru whom the system must be worked, were incapable of running the ideal machinery. Tho Mr. Allen is justified in ridiculing "the goodness fallacy," the notion that a good man is sure to govern well, yet he underrates the importance of simple, old-fashioned goodness in positions of trust and of power.

Mr. E. H. Harriman is a terribly efficient person. He and the other members of the quartet that sucked millions out of the Chicago & Alton Railroad could give our author advanced lessons on how to analyze railroad reports. But they used their ability and their information not to improve the returns, but to transfer a fortune from the railroad treasury to their own pockets. Their statistics were sound, but their principles corrupt. We insist that political representatives shall be honest, because honesty is the first ingredient of efficiency for their duty. Incidentally Mr. Allen shows how his remedy failed when adopted by the Comptroller of New York City, because the men appointed to do the counting and tabulating were spoils hunters, men whose chief qualification was that they needed a job. Exactly! Reformers who have preached civil service reform, then were not blind because they didn't adopt the statistical remedy, for that, like ballot reform and all other remedies, depends in great part for its effectiveness upon the good will of those who apply it. By all means let us have schedules, tables, data, summaries, percentages and the other arithmetical matters that delight Mr. Allen's soul; but be it remembered also that efficiency for democracy demands many other elements for which citizens with no mathematical bent must continue to strive.

The Whirlpool of Europe

THE authors of *The Whirlpool of Europe** claim in the preface that: "There is no book in the English language—and perhaps none in any language—which gathers up all the loose strands of this tangled web and weaves them together into a coherent whole. Many valuable studies and monographs have been written on various phases or sections of the subject, but of Austria-Hungary as a whole, of the political, racial and social evolution of the countries over which the Hapsburg Emperor-King holds sway, there exists at present no account to which the reader can turn."

As far as the English language is concerned we have to acknowledge that the authors are entitled to make the above statement. The book is highly interesting to all who wish information about the problems of the Dual Monarchy. The authors have done a great deal of historical research in this very difficult field, and have told the complicated history of Austria-Hungary in a way to attract even the general reader. The illustrations also constitute an important source of information, for the authors have selected them with care and taste. They have been very wise to omit the beautiful but well-known views of Vienna and the Alpine region of Austria, and instead giving preference to the equally beautiful and little known landscapes and peasant costumes of Hungary, Bohemia, Moravia, Dalmatia, Bosnia, Herzegovina, Croatia, Transylvania, Galicia and Bukowina.

The shortcomings of the book are in the conclusions and the observations of the near past and the present-day life. The intimate knowledge which cannot be taken from books, but which can be obtained only by an extended sojourn in the country, is often lacking, and in its place there are categoric statements not always reliable. For one thing the authors hardly do justice to Austrian art. "Austria's school of art has no special European reputation," they state. We could name dozens of great figure painters besides Hans Makart, portrait painters, like Canon and Angeli, who have not only been commissioned by the courts of Austria, but also by the other courts of Europe. The "Secession" may not be to the taste of the authors, but certainly the Vienna Secession stands as high as that of Munich and Berlin. In the modern architecture Vienna is unexcelled. In arts and crafts the Imperial Museum of Vienna was the leader, and its pupils have spread the movement to Germany. The Austrian productions are harmoni-

* THE WHIRLPOOL OF EUROPE: AUSTRIA-HUNGARY AND THE HAPSBURGS. *By Archibald R. Colquhoun* and *Ethel Colquhoun*. With maps, diagrams and illustrations. New York: Dodd, Mead & Co. $3.50.

ous in color and line, devoid of the eccentricity sometimes spoiling the artistic effect of German arts and crafts work.

They also state that there exists no Austrian school of drama. The Viennese and the inhabitants of Upper and Lower Austria are German and are nearer related to their neighbors in the German Empire than to the Slavs and Hungarians in their own empire. The Viennese theaters are German, and therefore the Austrian dramatists write as well for Germany as those of Germany for Austria. But there is also a distinctly native German-Austrian school of drama; Franz Grillparzer's classic plays, "Hero and Leander," "Sappho" and other dramas will never lose their value. Then there was Raimund, with his popular Volks dramas and fairies, still acted in Austria. Nestroy's farces were very popular some time ago. Ludwig Anzengruber's dramas of peasant life were the first German problem dramas; and now we have a very noticeable school of modern drama in Austria, including some names of worldwide renown—Georg Hirschfeld, Robert Bahr, Arthur Schnitzler and Hugo von Hofmannsthal.

Many prominent authors have treated the Hungarians and the Transylvanian Szeklers in extensive works. We only mention Bonner's "Transylvania" and Louis Felbermann's "Hungary and its People"; also O. B. Friedmann's "Zehn Jahre Oesterreichischer Politick," which deals extensively with the Austro-Hungarian questions. The riches of Hungary and Transylvania lie in the wonderful fertility of their land and in the exceedingly great mineral wealth, equaling, and in many instances surpassing, the United States in variety and richness. But the gambling, dissipation and the noble Magyar idea of the "undignified occupation of steady business," as it is well pictured in this book, have prevented development. Nevertheless, the authors ignore the facts that the legislation, the monopoly of mineral wealth by the Gov-

A BOSNIAN FALCONER.

ernment, the bleeding taxation and the determination to shut out foreign enterprise have killed progress. Otherwise not only Hungary, but the entire Austrian Monarchy, might be an ideally prosperous land.

The Golden Hawk. By Edith Rickert. New York: The Baker & Taylor Co. $1.50.

It is doubtful whether we of the gray North will ever be able to understand the golden spirit of Provence; yet we are not incapable of seeing its beauty and its brightness. Daudet's hero, Tartarin, will find a formidable rival in Trillon, the insouciant hero of Miss Edith Rickert's

EDITH RICKERT,
Author of "The Golden Hawk."

new novel, *The Golden Hawk*. It would be difficult to find a more engaging vagabond, in literature or anywhere else. That anything so vivid as he should flash forth from a dusky sausage-shop in Avignon is one of the minor miracles possible to a Provençal. As among many species of birds the male is much more splendid than his quiet mate, so in Provence. And we find Trillon more superb of costume and more striking of aspect than is the pretty Madeloun, who is fair enough to set three lovers at loggerheads about her favor. It is a story of the sun, who is almost a character in the book; we feel the wavering, blue heat lines, we can almost smell the faint grass curling up in the hot noontide; and the people are not to be judged by any colder wisdom than the lore of the heart. Trillon is nineteen and Madeloun seventeen, and the season is April, when their story begins, and it is a pretty story, full of surprises for even the seasoned reader of summer fiction.

The Story of Old Fort Johnson. By W. Max Reid. Illustrated by John Arthur Maney. New York: G. P. Putnam's Sons. $3.00.

While bringing together the materials for a connected and attractive story of a mansion famous in Indian and Colonial history, Mr. Reid makes his theme the starting point for innumerable excursions, which terminate sometimes in a battle field, sometimes in a trout-pool. There is sport to be had at the trout-pool, to be sure; yet somehow the writer lacks the literary art to make the reader wait, without considerable impatience, the occasional emergence of the Old Stone Fort and its interesting occupant, Sir William Johnson. The old house, built in 1742, is still a survival of the romantic and bloody time of the French and Indian War. It was here, in its flat valley, dominated by low hills, that William, "onruly and streporous" boy that he had been while dwelling in the county of Meath, Ireland, roving blade and Irishman of wit as he grew up, came at last to sit at his own table, in the wilderness, waited on by the various mothers of his abounding family of white and copper-hued children. Here he held mighty pow-wows and talked Iroquois-English with his famished wild locusts of the woods; for undoubtedly an Egyptian flight of locusts were his Indian guests, altho the reader becomes greatly interested in some of them—notably, among sachems of lesser importance, he is ready to put up with Nicolaus Brant, that portentous warrior of the Mohawk and "man of most prodigious silence"; also with the ponderous Hendrick (well known to the reader of Cooper), who was of use to the colonies and to Sir William, holding in check, as he did, the powerful Six Nations, besides being uncle to three of Johnson's children, and possibly great,

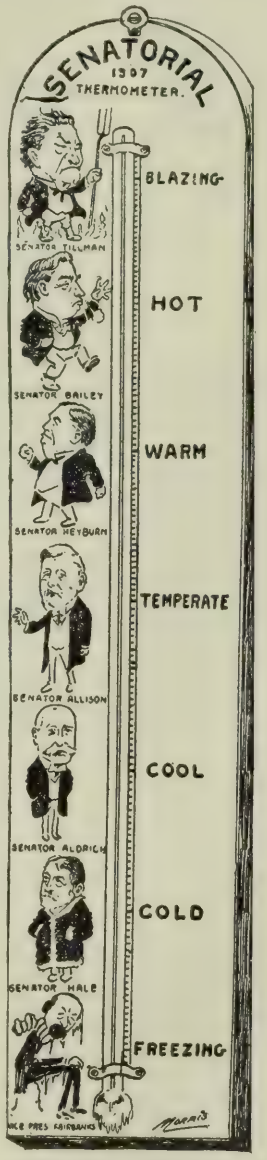
great uncle to eight more of them. Sir William, at the old fortress, was a strong defense at the corner where three peoples met—always in the interest of the English. In the colonies he held to the Crown, and his son, Sir John, couldn't break away from his allegiance abroad. The history of the Old Stone Fort is followed, meanderingly and intermittently, thru its various vicissitudes; so also are the successive streams of semi-savage offspring. To the lover of the old, the wild, the picturesque in early American life, the book will possess charm; to the general reader, it will supply abundant detail with which to reconstruct a most romantic period. To the historian, it will offer a reason for doing the work over again.

My Pilgrimage to the Wise Men of the East. By Moncure D. Conway. Boston: Houghton, Mifflin & Co. $3.00.

Mr. Conway is a born traveler and seer, unwilling to take the word of any man for that which he has a fancy and the opportunity to see himself. He is a seer with a vivid poetic imagination, with an irreverent reverence of his own, and goes thru the Religions of the Far East with little concern for anything but what appeals to his own sense of truth and beauty. If he fails to find truth and beauty in any form of worship, in any cult, be it Christian or pagan, he says so frankly—often, indeed, with emphasis, and with that same firm faith in the poetic inspiration of the moment that sometimes in a long life has kept him right; sometimes, by his own confession, has misled him. The desire to see the beginning of things, the bottom and top of things, led him some twenty odd years ago to the land of the Hindu, where the Nautch girls and the devil dances pressed close upon the porches of ancient temples, where the "marvelous dolls" suggested questions not to be answered by so learned a Pundit as the Maharajah, Sir Jotundra Mohun Trajore, tho both he and Mr. Conway could see thru the Theosophist delusion fostered by Madame Blavatsky. Mr. Conway, as he had found in Brigham Young something of a moralist, so he found in the Moslem faith the pliant backbone of Christianity. Neither he nor the rationalistic Pundits could accept the story of the Immaculate Conception, for instance, as anything more than a pretty poetic legend; but this view did not appeal to the learned Moslems, who "felt bound to accept the narrative just as it stands in the New Testament." Many readers will be more interested by his picturesque account of Eastern customs than by those side-path excursions which lead so often to theological discussion. He found the Eastern nations, with their seventy-two religious diversities, full of gods—all of them instructive, many of them venerable—full also of "cults," some of which were, in his estimation, worshipful enough to have deserved formulation on the pleasant banks of the Four Rivers. In these he finds much to praise, and repeatedly draws comparisons, favorable to the more ancient cult, between the simple-minded philosophers of early times and the crusaders of the present day who still waken the echoes of "man's inhumanity to man."

Queen Louisa of Prussia. By Mary Maxwell Moffat. New York: E. P. Dutton & Co. $3.00.

Those persons who find pleasure and diversion in reading memorial volumes on martyred kings and unhappy queens will welcome Miss Moffat's recent contribution to that branch of literary exercises under the title of *Queen Louisa of Prussia.* This unfortunate lady was the wife of Frederick William in the dark days when his kingdom was overwhelmed and bitterly humiliated by Napoleon. Now, no serious student of German history, who knows about the right royal deeds of Frederick the Great, or of the preceding Hohenzollerns, will weep over the fate of Prussia at the hands of the French, but while this is true we may regard the life of Queen Louisa as a sad tragedy in many respects. Ranke placed her next to "Old Fritz" in the memories of the Prussian people, and her passionate devotion to the war party which finally hurled the French beyond the Rhine has forever enshrined her in the history of German patriotism. This tragedy, our author has depicted with skill and color and in a fashion that draws the reader along from the beginning to the close of the



sad tale. If not taken as a balanced history of the period it will do no harm, and may serve to interest casual readers to a period of German history of crucial importance.

Literary Notes

....In *Christianity and Its Bible* Mr. Henry F. Waring has attempted to furnish a text book for a class or congregation on Biblical literature and history, on Christian doctrine, and also on the history of the Church from its founding to the present day. (University of Chicago Press, $1.00.) The spirit of the book is excellent, its general scheme good, but the author has attempted to cover so much ground in such little space that his treatment of certain subjects and periods is inadequate, even for the barest outline.

....The *Bible Hero Classics* are a series of twelve pamphlets consisting of the Biblical narrative concerning prominent Old Testament characters in the text of the American Revised Version, without other addition or comment than that of appropriate paragraph headings. The design is to present the more interesting portions of the Bible in convenient form, and to bring together such passages as describe the life and character of the principal personages. There are twelve numbers in the series, Abraham, Jacob, Joseph, Moses, etc., and the price is very moderate, 6 cents each postpaid. (Chicago: Hope Publishing Co.)

....Prof. Henry P. Forbes, of the Canton Theological School, concludes the excellent *International Handbooks to the New Testament* with a commentary on *The Johannine Literature and the Acts of the Apostles.* (Putnam's, $2.00). The author is somewhat more keenly aware of difficulties and discrepancies in the text than the ordinary student may think necessary, or the orthodox consider proper, but a reason is advanced in each instance, and the spirit of the book is not dictatorial and dogmatic, but enlightening and persuasive. This series affords much information in brief space and at moderate cost.

Morris, in Spokane *Spokesman Review.*

Pebbles

IN THE SWISS MOUNTAINS.

"ETHEL, that awfully handsome guide kissed me a moment ago. Do you think I ought to deduct something from his pay, or add to it?"—*Translated for Tales from Fliegende Blätter.*

A CHICAGO man wrote a New Year's poem and then killed himself. Would suggest that others contemplating such action reverse the order.—*Harper's Bazar.*

"YOU must not expect me to give up my girlhood ways all at once."

"Oh, I won't. I hope you'll keep on taking an allowance from your father just as if nothing had happened."—*Illustrated Bits.*

IN PITTSBURGH.

"While rummaging an old vest just now I found $1,000,000 that I didn't know I had."

"Lucky boy! I'll match you for it."—*Pittsburgh Post.*

THE Kentucky man who reported having seen a whistling rat with yellow body and blue feet will greatly relieve the feelings of a number of men if he will state whether it also had a green tail.—*Washington Post.*

"MY!" exclaimed Mr. Klumsay at the holiday hop, "this floor's awfully slippery. It's hard to keep on your feet."

"Oh," replied his fair partner, sarcastically, "then you were really trying to keep on my feet? I thought it was accidental."—*Scrap Book.*

"DID the burglar seem at all impressed by your attempt to reform him?"

"I think he did. Anyway, he let me talk right on. Pretty soon he saw mother's picture on the wall. 'Who is this?' he asked, and I told him. Then I said, 'How would your mother feel if she could see you at your present work?' That seemed to move him. He paused a moment, then he stepped up to mother's picture. 'I don't like to have those accusing eyes watching me,' he said, and turned the picture with the face to the wall."

"That certainly looked as if he couldn't be all bad."

"Didn't it? I thought so, too. And then what do you suppose happened?"

"Tell me."

"I had put a roll of bank bills that George had given me to pay my dressmaker's bill behind the picture for safe keeping. I supposed nobody could find it there. When the burglar turned over the portrait the roll dropped to the floor. He saw it fall; he picked it up. He looked around at me and closed one eye. Then he thrust the roll in his pocket and hurried thru the window and across the lawn."—*Cleveland Leader.*

"WHY don't you like the people in the flat next door?"

"Oh, the husband preaches Wagner from morning until night."

"And the wife practices what the husband preaches."—*Pitsburgh Post.*

A Nation's Aim

WHETHER a nation's chief aim should be the wealth or the happiness of its people, or something other and worthier, the reader of Mr. Mackaye's article this week, and of the three articles which follow, will consider. They are of that serious kind of discussion which used to be more sought on Independence Day than is now the fashion. Particularly will Professor Munsterberg's criticism lift one's thoughts into those higher levels which befit the better idealism of the day.

Our national birthday recalls our history, and gives us assurance for the future. Today we fear sometimes the influence of the ignorant and viler elements of our population, the millions that come to us unassimilated, illiterate, ignorant of our history and traditions. We think of the slums of our cities, the vicious voters, the corrupt government, and we fear for the future. But do we remember that there never was a time in the history of our country, from the earliest colonial period, when conditions were more ideal? We imagine that the earliest settlers were Pilgrims, Puritans and Cavaliers; Bradfords, Winthrops, Calverts, Penns, Oglethorpes. Such was not the fact. They were the exceptions. In New England, in Virginia, in New York, in Georgia, the mass of the settlers were ignorant, and to a great extent vicious. They were sent over by the shipload, the scum of the prisons and the poorhouses. The colonies were a Botany Bay, to which the useless and worthless were driven from their country for their country's good. Then there were the black slaves, as well as the indentured white slaves, the "bound boys" and "bound girls." Such as these constituted a very large part of the population, and were the burden of the laws and the courts.

And yet the country grew healthily, and we forget from what sources we came, for we like to remember our worthy and not our unworthy ancestors. The just are held in everlasting remembrance, while the name of the wicked shall rot. It is intelligence matched with goodness that rules in the end, for it sets the aim to which the youth are bidden to strive.

We hear it said on this Fourth of July that God sifted England to choose out for America the lovers of liberty, the choice independent souls, the earnestly religious spirits, the seekers after higher ideals, those free hearts whom tyranny in Church and State could not endure. It is a pleasant fiction, only partly true. Of not more than three or four of the thirteen colonies was it even partly true; two or three in New England, one or two others. Most of the colonies were commercial ventures pure and simple. Religion did not enter into the question, nor did liberty. They wanted land and money. They were merchants, traders, planters, if they were not the riff-raff that goes where it is driven. And yet, when the time of decision came, the colony named after the Virgin Queen was quick to answer the call of liberty which Samuel Adams sent from the colony which took its name from the local soil. The trading Dutch of New York had no less religious fervor and no less patriotism than the Quakers of Pennsylvania. Today there is one standard, one faith, one patriotism from Maine to Florida, from Jamestown to San Francisco. If there have been other times and other waves of population, the better is acknowledged to be the purpose, and it rules from the Lakes to the Gulf, from the Atlantic to the Pacific.

It is a narrow view which fears that Church and school cannot assimilate our diverse immigrants. It is ignorance of our history which loses courage at the sight of our congested slums. It is blind-

ness that cannot see that our negro millions may reach the higher standards which others have attained. Give our wiser people a Christian patriotism, a sense of their duty to those who have had less chances in life, to those who have come to seek this land of liberty and opportunity, and their aim and purpose will be contagious; and as in the past so in the future, we shall have one liberty, one culture, one American tradition, which will ever recall the noblest, the freest, the bravest and the purest in our history, and forget the ignoble and the vile. That nation will never sink whose people look for something more than pleasure, who gaze upward for starry ideals; while that nation will inevitably sink and fall whose people are satisfied to walk the low levels of indulgence, physical enjoyment and wealth.

Mr. Knox on the Federal Power

In his address at New Haven, Senator Knox was speaking to law students and lawyers, not to the general public. What he said, however, was interesting to the American people, because his subject, "The Federal Power to Regulate Commerce," is one of great and immediate importance; because of his course as Attorney-General and legislator, and also for the reason that he is a candidate for the Presidency, with the support of his party in Pennsylvania. The address was an elaborate and learned essay, marked by the exactness and judicial gravity of a Supreme Court opinion. In it there was no statement as to the policy he would pursue if he should be elected to succeed Mr. Roosevelt. Such a statement would have been out of place there.

And yet his views as to the constitutional scope of the power about which he was speaking, and as to the recent use of this power, bear directly upon that question of executive policy. On account of them, or owing to a false interpretation of them, some have called him a reactionary. In the address we see no evidence that he is one, no indication that he is not in sympathy with the general course of national executive action during the last few years, or that he does not approve recent legislation for the exercise of the power in question. He did point out, however, that in his judgment certain suggestions as to a further exercise of the power were impracticable and futile, because the power was not broad enough to cover them, and because legislation embodying them would be pronounced unconstitutional.

He called no halt, but virtually asserted that one would be called by the Supreme Court if these suggestions should be approved by Congress. He had especially in mind the proposition of Senator Beveridge for the regulation of child labor by the exclusion of the products of such labor from interstate commerce. We quote from the address certain passages in which the substance of his opinions may be found:

"The necessity to exercise the national power over commerce arises largely out of the failure of the States to regulate wisely great corporations created by and under the dominion of the States and engaged in interstate commerce. That failure has led to well known abuses which affect interstate commerce, and has thereby created the necessity for the exercise of Federal regulation to prevent the abuses. . . . .

"In my judgment, the power to regulate commerce between the States does not carry with it the power to prohibit commerce, unless the prohibition has for its purpose the facilitation, safety or protection of commercial intercourse, or the accomplishment of some other national purpose.

"The power to regulate interstate commerce does not extend to the laying of an arbitrary embargo upon the lawfully produced, harmless products of a State, nor to the right to defeat the policy of a State as to its own internal affairs.

"I concede that the national power to regulate interstate commerce carries with it the right to prohibit commerce in order to secure equality of commercial right or to prevent restraint of or interference with commerce, but not to prohibit the shipment of the innocuous products of producers within a State who are pursuing a course sanctioned by the laws of the State and in no wise in itself interfering with interstate commerce. . . . .

"The power of prohibition has never been sustained except as against articles noxious or dangerous in themselves. It is not possible to find even a suggestion that in respect to natural products which are prime necessities Congress can prohibit commerce in them between the States in order to enforce its conception of what would be a wise police regulation of a State. . . . .

"The sum of the matter, then, is this: For the purpose of protecting commerce, Congress may close its channels to those who are injuriously affecting it, but for the purpose of enforcing a more enlightened policy in respect

to matters not within the jurisdiction of Congress it has no such power. . . . .

"It is beside the question to urge the desirability and popularity of measures if Congress has no power to enact them. I remember and am impressed by the words of President Roosevelt in his first message to Congress, that 'the men who demand the impossible or the undesirable serve as the allies of the forces with which they are nominally at war, for they hamper those who would endeavor to find out in rational fashion what the wrongs really are and to what extent and in what manner it is practicable to apply remedies.'"

Some years after that first message, Mr. Roosevelt, drawn to the support of the Beveridge bill, said that if State authorities did not do their duty "in matters of such vital importance as this of child labor," there would be "no choice but for the national Government to interfere." It does not follow that Mr. Knox was attacking the President. Still, if Mr. Knox is right as to the constitutional scope of the Federal power, the President's measure of that scope is incorrect. It may be, also, that Mr. Knox's measure of it would exclude the President's plan for imposing heavy inheritance taxes to cut down swollen fortunes.

The failure of the States to regulate great corporations wisely has not always been due to neglect, but sometimes to inability to enforce their own laws against foreign corporations, and this inability has been related to decisions of the Supreme Court. Mr. Knox remembers what Minnesota sought to do in the case of the Northern Securities Company, before the national Government, represented by himself, attacked that combination.

Probably Mr. Knox's view as to the limits of the Federal power would exclude the project for controlling by Federal licenses great manufacturing corporations engaged in interstate business, a project which has from time to time been advocated by the President and Mr. Garfield. "Congress cannot regulate production" or "the persons by whom articles of commerce are produced." The inability of Congress by Federal license to regulate the capitalization of such corporations and their methods of overcoming competition in the sale of products appears to be established, in his opinion, by the reasoning which he uses with respect to the proposed regulation of child labor. If our memory is not at fault, bills involving Federal regulation of the methods of competition in sales, and imposing penalties suggested by the privileges of interstate commerce, were proposed and supported by him when he was Attorney-General. Reflection and study appear now to have convinced him that such measures are not within the scope of the Federal power.

The limits of the existing grant of Federal power over commerce have not yet been finally marked. Under the Constitution there is ample power, in the national Government, or in the State Governments, or in both, for use in dealing with the serious abuses and weighty problems of the time. It is possible that the organic law, or the authoritative interpretation of it, may prevent or defer an effective use of this power. No good American desires that the Constitution shall "perish at the hands" of Mr. Knox's "impassioned phrase-maker," whoever he may be, or that its authority shall be impaired. But it may be necessary to amend it in the future, as it has been amended in the past. We may be sure that if by any amendment hereafter made the present allotment of power shall be modified, the change will be the work of a great and intelligent people, intent only upon the promotion of the general welfare.

One Hundred and Thirty-one Years Old

THE famous juvenile question: "How tall was Alexander, Pa?" could be as easily answered as a question which may naturally be asked at this particular moment about the age of the United States of America. When one stops to think of it, how old are we, the people of Uncle Sam?

Ought we to date ourselves back to the arrival on this continent of the masters of the oldest race that forms a part of our citizenship? A goodly number of American Indians have been and are citizens of this Federal Republic, and voters. There is every reason to expect that at no distant date the blood of all the surviving Indians on the reservations will have mingled itself with European and negro

blood in the heterogeneous stock which in that day will be known as "American." If our age is to be counted from the origin of our oldest blood, our antiquity is eminently respectable.

But this way of looking at the problem is, perhaps, a bit fanciful. If we rule it out, where next shall we begin? The discovery is announced of a ship anchor of supposedly Scandinavian origin, dug up from an out-West clay bed. Did the pirates of Leif Eriksen's day make their way to the headwaters of the Mississippi, and are we about to have a new school of American historians, with headquarters, say in Minnesota, who will demonstrate that the Northmen have been continuously in occupation of that region for nearly a thousand years?

But this, too, is somewhat speculative and unsubstantial material. Not so the occupation of Florida by the Spaniards from 1513, or the exploration of South Carolina and the lower Mississippi Valley by De Soto, or the Coronado exploration of the Southwest and the great plains. In these enterprises, at least, were elements of European influence that persist in our national life until this day.

However, because English colonists and English influence became politically dominant north of the Mexican frontier, and the nation that grew to maturity in the domain between the Mexican frontier and the St. Lawrence River has been an English-speaking nation, with an inheritance of English laws and institutions, we may, with some show of reason, date our age back only to the founding of Jamestown, in 1607, an event which, it is said, we are celebrating this summer in a mildly decorous way with an "Exposition." It must be confessed, nevertheless, that nobody is talking much about being three hundred years old, or getting particularly excited over the anniversary. Mr. Thomas Fortune Ryan, we suppose, is enjoying it with something of the ardor with which East Side youngsters wax eloquent in their debating clubs over "the deeds of our forefathers" at Lexington and Bunker Hill.

If Mr. Alexander Hamilton had been a better marksman than Mr. Aaron Burr, and could have survived the ravages of time until now, he would presumably be a stickler for 1788 as our true original birthday. Still, even this contention would not be unassailable by historical criticism, because, altho the Federal Constitution undoubtedly went into effect when it was ratified by New Hampshire and Virginia, the new government was not organized until Washington was inaugurated in April, 1789.

When difficulties like these present themselves to the historical intellect, it is just as well, on the whole, to adopt some arbitrary solution of our problems, and stick to it. And with a view to sticking to it, it is necessary that the solution shall be one that the man of the future, no less than the man of today, shall be satisfied to accept. Now the man of the future at this particular moment is the American small boy, and this important person is thoroly convinced that the true and unimpeachable date of our origin was July 4th, 1776. We bow, therefore, to his wisdom, and formally declare that the American people is at the present moment one hundred and thirty-one years old.

There is a certain fitness also in this date, because, as the lives of nations run, we are still in the small-boy age of our evolution. Rome lived to be approximately twelve hundred years old. Our mother country, England, if we date her national life from the Anglo-Saxon invasions, is something over fifteen hundred years old, and she is still very well preserved. Considering our heredity, we may hopefully look forward to two thousand years, at least, of useful activity.

In view of these considerations, we should not be over-much abashed or discouraged if our temperament, our manners and our mode of life are still those of the unappalled kid. There are hours when we are disposed to regard our present Chief Magistrate as a person who rather strangely combines the characteristics of the grown-up statesman with those of the youthful commander of a company of broomstick soldiers. But, really, why should he not? What other sort of a President could be quite representative of a great people destined to live at least two thousand years, and at present only one hundred and thirty-one? Why should any one be surprised at Mr. Roosevelt's popularity? It is the

most natural thing in the world. Is he not precisely that combination of great man and "kid," which our stage of maturity calls for?

Progress of Woman's Suffrage

INTEREST in the movement for woman suffrage has received a considerable impetus by the enfranchisement within the past year of the women of Finland and Norway. The former has granted the ballot to all women on exactly the same terms as to all men—that is, universal, equal and direct suffrage to all who have completed their twenty-fourth year, and who pay an annual poll tax, the men of 24 cents and the women of 12. All who are entitled to vote are eligible to be elected to the Parliament, which consists of but one house.

The long oppression under which the men of Finland suffered for so many years, when they were deprived of all voice in their government, and the devotion, courage and loyalty of the women during this dark period, were doubtless the reasons which impelled the men to include them in all the political rights which they finally gained for themselves. The women suffered every privation, took every risk, were sent to prison and even to Siberia. When at last the Finnish people wrested from the Czar of Russia permission to have a constitution which would enable them to govern themselves, all political parties were united in the desire that it should give equal rights to women. When it was approved by the Czar and went before the Finnish Parliament for ratification, only one voice in that body was raised against it. The women themselves held large mass meetings, passed resolutions, circulated petitions, and left the country in no doubt as to their wish and determination to have their full rights under the new government.

The constitution was approved by the Czar July 20th, 1906, and went into effect October 1st. The five parties—Old Finnish, Young Finnish, Swedish, Agrarian, and Social Democratic—nominated a large number of women for Parliament, and on March 15th nineteen of these were elected. In many districts the women voted in larger numbers than the men, and were everywhere treated with great cordiality and respect. The Diet convened May 22d, and for the first time in the world's history women took their seats in an elected national parliament.

Norway has followed the example of Finland, its Parliament having granted the franchise to women June 14th, not, however, to as full an extent, as it is limited by a slight property qualification. An association of Norwegian women has been actively at work to secure the ballot since 1885, but the Parliamentary suffrage for men was not made universal till 1898 and the municipal till 1901. A vote on local option was given to women in 1895, on church questions in 1897. They annually presented large petitions for the Parliamentary franchise, and their bills often were favorably received. When finally it was proposed, in 1898, to give the municipal vote to all men they protested so vigorously against any further enlargement of the suffrage which did not include women that Parliament compromised by giving the municipal franchise to all women paying taxes on a yearly income of $75 in country districts and $110 in cities. Property on which the husband was taxed was considered as community, and entitled the wife to vote, and men could do so without paying taxes. Women were made eligible to municipal councils, and ninety-eight were elected that year, with 160 substitutes. In some of the cities 90 per cent. of them went to the polls. The next year Parliament declared women eligible as members of juries, and they have since been serving in considerable numbers. They fill many offices and sit on public boards.

When the great question of the separation from Sweden was referred to the decision of the people, in 1905, the women importuned Parliament to allow them to vote on it, but were refused. They were so determined to register their opinions that under the lead of the National Woman Suffrage Association, and with great trouble and expense, they collected signatures of nearly 300,000 in favor of separation. These they presented to Parliament with an address from 565 societies of women. The men had recorded 385,000 votes. This action on the part of women made a strong im-

pression, and last summer, during the session of the International Suffrage Alliance, in Copenhagen, the Prime Minister sent a message to the Norwegian delegates that the Government would soon be ready to propose the question. The bill has just passed by a vote of 96 to 25, and it gives the Parliamentary or full suffrage on practically the same terms as the municipal was granted—a tax on an income of $84 in the country and $113 in the city, the husband's taxes entitling the wife to a vote. A woman earning from $1.50 to $2 a week will be able to vote. The women asked for suffrage without limitations and for eligibility to Parliament. The new law admits them to the lower House. With the power in their hands, however, to elect the members, they should soon be able to enlarge their own privileges. It is supposed that about 300,000 women are enfranchised.

The effect of Norway's action on Sweden is an interesting question. Since the separation of the two countries the feeling of hostility between the women has been intense. The meeting of the International Council of Women, in executive session at Paris, last summer, was almost disrupted by the antagonism between the Norwegian and Swedish delegates and it was largely thru the disinterested offices of those from the United States that the peace was preserved. During the meeting of the International Suffrage Alliance in Copenhagen, a little later, after the delegate from Norway had made her report in which she foreshadowed what has just happened, the president, Mrs. Carrie Chapman Catt, of the United States, said facetiously: "We shall all hope that the Norwegian men will give the suffrage to their women, for then the Swedish men, not to be outdone in chivalry, would at once proceed to confer the same right on their women." Instantly the Swedish delegate, a distinguished physician of Stockholm, left the platform, and it was impossible, by explanations or apologies, to persuade her to return. The Swedish women are very thoroly organized for obtaining the suffrage. They have had all except the Parliamentary franchise for many years, and since 1902 they have been making a strong and systematic effort for this. About fifty members of their association were received by the King, a few months ago, who expressed full sympathy with their movement but feared it would endanger that enlargement of the suffrage for men which was being urgently pushed. There are about seventy suffrage societies and they sent in a petition, signed by 142,168 women, ten times as large as any ever before presented in Norway. They were assured by members of the Government that when the Reform bill, which goes a long distance toward universal suffrage for men, was out of the way the claims of women should receive consideration. This bill has been past and almost simultaneously the women of Norway have been enfranchised. It seems very probable that with this example on the one side and that of Finland on the other the Swedish Parliament will be forced to take action on this question.

Going to the Country

THE editor recently received the following letter:

Dear Sir—I am very much moved to seek a home in the country. All my life I have lived in the city crowd. I love trees and long for freedom. But what can I do about it? I have only about four thousand dollars at my command, and I do not see clearly how to use this to advantage apart from trade. Every morning I go to a close office and there I stay all day—it is monotonous in the extreme. I do not quite detest the roofs and chimneys; they have a certain beauty for me—are old companions. But what next? Is it to be mere routine forever? I do not care to look ahead. —Truly yours.

Well, just such folk live also in the country. Moving from place to place is no help for the disease; for that it is.

We believe in the country for most people, but it will not ensure our correspondent relief from monotony. There are thousands of folk all about the hills and valleys who only know these valleys and hills by name; nor do they ever get into any real companionship with trees, brooks and meadows. Some of them do not even hear the birds when they sing, and cannot tell an oriole from a song sparrow. To them a horse is simply a beast of burden, and a cow is what one of our Commissioners of Agriculture

called "a board-faced animal." There is a good deal in heredity, and a good deal more in education, to create this sort of people. They may as well stay in the city. If you are going into the country to add yourself to the blind and the deaf you will find no relief from your ennui. The real object of going into the country for a home is not even to secure more comfort, a plenty of green corn, tomatoes and fresh cucumbers.

What the country can give you—that is, can give to some people—is more *life;* a larger, fuller and broader method of living. It certainly is an incentive to own your own house, have your own garden, gather your own eggs, and walk in your own orchard; but the real thing is that you can, if you have got it in you, grow yourself, and bear more fruit of an intellectual and moral sort. To do this you must be something more than a lover of trees and flowers—which means generally that you like them without understanding them. You must know them, must study them, and everything else about you, until you are intimately acquainted. In other words, the country is a big schoolhouse full of object lessons. So it comes about that we have to tell you to stay in the city, if your only objection to city life is that it bores you; the country will only give you temporary and slight relief. We know a great many people to whom a country life is dull abstemiousness, touched with a good deal of self-denial and abnegation.

A great deal is written lately about the simple life. Very few of the writers seem to have any comprehension about what such a life must be. It is something that is as yet utterly out of fashion. The chief trouble that we have to endure just now is the moving down upon us of a contingent that cannot let the country alone. They are bringing their city conceits, city architecture, city turnouts, and their five-course dinners, which are going to be thoroughly "simple" under the apple trees and maples. They have been caught in a tide that is flowing countryward. It is to them a mere fashion. They have heard of the simple life and are converts. What we shall do with them is hard to determine. They are not converted to Nature, nor will they give up their artificial life and artifices. They are coming here to squander money and set a ruinous example. They pay extravagant wages, far above the capacity of the average countryman, and so make help all the less procurable.

That admirable essayist who gave us the Upton Letters says that the one thing fatal to simplicity is the desire to stimulate the curiosity of others. Then he serves up Thoreau as a bad example of simplicity. He had extremely simple tastes, to be sure; "but he was indolent rather than simple," and what spoiled his simplicity was posing for observation and admiration. He was always peeping out of the corner of his eye while he played hermit, to see if inquisitive strangers were not hovering about to observe him. He thinks that if Thoreau had really preferred simplicity he would have gone right along about it, and not found it so marvelously interesting. To carry out this sort of criticism would knock all the zest out of any sort of life. It may be doubtful if Thoreau was a model countryman, but he had eyes and ears, and he knew how to make the best use of them; and as for his books, they are great eye-openers.

To exploit the country is one thing; to fit into it is another. We have in mind a great hillside, or ridge of hills and glens, looking over creek lands and other hill ranges. It is superb in its glacier-carved and water-waved rolls and slopes, topped here and there, and dotted, and striped with native forest — between which nestle orchards, gardens and farmhouses. Its glens are fern covers, and its knobs are pastures full of cows, while its creeks hasten down from mill-wheel to mill-wheel. A rich man saw it and craved it. As soon as he had bought what he could of it, he began to reshape it. He builded walls, and leveled slopes, and terraced the hillsides. Nature asserted herself as long as possible, but at last she gave it up, and there was not a touch of simplicity left within his reach. The owner has a city house on a crowning hillside and he has his terraced lawns. It has proved a capital place for spending money. These extravagances, from the half-educated and semi-artistic, are neither here nor there. They do not help

us, and they are literally blotches on our hillsides. Is it too much to expect of a man who never planted a hill of potatoes, who cannot tell an ash tree from a willow, who in fact is totally ignorant of the country, to take the attitude of a learner? Let him be at least a pupil for a year or so, until he can get a breath of the country spirit. That is, let him be a pupa (which is only the root of pupil) until his wings can grow. The country has a right to rejoice over every sincere acquisition; but it has a right to scoff at the high-steppers, who make Nature over again for their own moods and measure. Any one who has lived and been comfortable in the crowd, or even imagines himself to be alive under such conditions, can afford to be very modest among the hills and valleys, and while undertaking an entirely different method of life.

Delightful as is the general fact of an exodus from congested city life, we do not feel warranted in encouraging those to come out of the crowd who cannot assert individuality. Yet we do not intend to discourage the writer of the letter from whom we have quoted. It is probable that he will find in the country environments suited to his development. It is certain that he will always have something new to look forward to if he becomes a student of nature. The key of the difficulty is that many of our come-outers cannot let go of the old. They set up at once a conflict with Nature, and in one way or another Nature is sure to come out ahead. She has a wonderful lot of helpers, sowing wild seed everywhere, tumbling down costly walls, and carving pretty terraces into something natural. So we are compelled to reply, If you are coming into the country, come with a deliberate purpose to be made over again—or at least a willingness to be. Accept your new environments as controlling forces, and understand that, if you will permit, they will recreate you. As to the money capital which you have at command, it is quite enough for any rational purpose. What we are more concerned about is that sort of capital which has no relation to the mint—a stock of common sense. We are in great danger of being flooded with the tide that is flowing countryward.

Mischievous Talk

Mr. Bryan is talking mischievously when he pushes upon the public the matter of the giving up of the Philippines. He knows very well that if he were President he could do nothing of the sort, and that Congress could do nothing of the sort. He has been twice a candidate for the Presidency and he has been to the Philippine Islands, and he can do a great deal of mischief there by stirring up the people on the subject. He is as much responsible as any one for the retaining of the Philippine Islands, for he favored the plan. He knew it had to be done and he must know as well as Mr. Taft that any transfer of the Philippine Islands to the control of the Filipinos or of any foreign power, would not be sanctioned even by his own party. The only proper way to consider the matter is, that, without any desire or intention on our part, we came into possession of them and we have an obligation to them. The talk about their expense to us is all nonsense. The Philippine Islands pay their own expenses. To be sure we have some soldiers there whose expenses we are responsible for, but we would have to support them somewhere else if we did not do it there. The entire cost of government, education and development is borne by the treasury of the Islands, and they are rapidly coming to self-government as well as self-support — quite as rapidly as is safe for them.

Remitting the Chinese Indemnity

The proposal of President Roosevelt and Secretary of State Root that Congress remit to China $27,000,000 of the $40,000,000 we should be entitled to receive from China for the Boxer outbreak, is startlingly altruistic, but only right. The actual losses sustained by the cost of the expedition to Peking and the destruction of American property are not over $14,000,000, of which China has already paid $6,000,000. The income of the Chinese Government is not large enough to make it at all easy to pay the total sums assigned as compensation, about $330,000,000 in all, of which Russia claimed $87,500,000, Germany $60,000,000, France $56,000,000, Great Britain $24,000,000, and Japan

$14,000,000. If we have thus suffered from China, it is also true that our skirts are not clear, and we ought not to join in any punitive demands. Our action will show to China that we have no bitter feeling toward her, but desire to do her full justice. And let it not be forgotten that such a generous act is not without a reciprocal advantage. It is well to be on the kindliest terms with China, a Power which will soon be able to do us much evil, and which has had such provocation that American goods have been boycotted. What we do may also be an example to other nations, or, if not, a rebuke to them for their excessive demands.

Governor Hoke Smith

Hoke Smith is now Governor of Georgia, and is a national character. He is even mentioned as a candidate for President, or Vice-President at least. If by some chance he should be put on the Democratic ticket, it would be greatly to the advantage of the Republicans, for the solid negro vote, which is now threatening that it will never cast its ballot for any one whom President Roosevelt favors, would be driven back perforce to support even Mr. Taft; for no negro could vote for Hoke Smith, whose canvass for the Governorship was on the basis of the disfranchisement of the negro. And now his inaugural address urges the same policy which he urged at the polls; legislation which is intended to exclude negro voters, not, of course, by naming the race, but by educational tests which will be so administered as to exclude all negroes who cannot read well, and to include all white men who cannot read at all. He would also have a rigid control exercised over the railroads by the State Railroad Commission. We presume that when it comes to exercising this power it will be found that necessity will compel a wise restraint so that no wrong will be done to either the corporations or the people.

The Abbé Loisy

This great French scholar is now in the home of his childhood, among his own flesh and blood upon the Marne. The Church which he served so well and so lovingly has discarded him and attempted to shelve his writings, which, however, will not down. His ideas, in spite of encyclicals and pastorals, infiltrate the seminaries, not indeed under his own name, but rather as Newmanism. With a coterie of scholars, some over their own signatures, but most with pen names, Loisy has edited the ablest critical review—perhaps the only genuine critical review — which the Church of France has, viz.: *La Revue d'Histoire et de Literature Religieuse.* Now Cardinal Richard has attacked it. He has just forbidden his clergy to write for or aid it in any way. His ban will be followed by that of many more bishops. It seems that not only the purity of doctrine is at stake, but a game of ecclesiastical politics lies underneath. Among the writers who sign their names is the Abbé Lejay, the famous philologist and professor at the Catholic Institute of Paris. The Jesuits are capturing this institute. Recently they secured two chairs and now they have hung over Lejay's head a new sword of Damocles. On their part, the staff of the *Revue* must have got wind of the coming condemnation. The number for July-August has just come out, only a few days ahead of the Cardinal. Thus they have time from now till September to study a way of escape. In the letter of Archbishop Richard, the names "Dupin" and "Herzog" are both sobriquets. "Herzog" argues that our Lord's "brethren" were Mary's own sons, which is a heresy.

With $85,000,000 surplus in the national treasury this year, the Government sells no bonds to dig the Panama Canal, but pays for it out of current receipts. To be sure, it might be said that as the future is to get the benefit of the Canal the future should pay for it, and the surplus should go for improving harbors, building post offices, etc. But it is more honorable to pay one's way and pay one's debts as far as possible. Why should we not do something for posterity, like the old man who set out an apple orchard?

Does the intelligent reader wish to know the size of an atom, say, of radium? It is calculated by Norman R. Campbell, in *Nature*, and is this: 2.13×10^{-24}. Do you understand?

The Fireboat Service of New York

NEW YORK has a fleet of ten fireboats, of which there are seven in commission and three under course of construction. The names of the fireboats are as follows:

"Zophar Mills," Engine Company 51; "The New Yorker," Engine Company 57; "William L. Strong," Engine Company 66; "Abram S. Hewitt," Engine Company 77; "George B. McClellan," Engine Company 78; "Seth Low," Engine Company 123; "David A. Boody," Engine Company 132; "Thomas Willett"; "James Duane"; one as yet unnamed.

THE NEW FIRE-BOAT "THOMAS WILLETT."
On the stocks at Newburgh, N. Y. This and her sister boat, shown on the following page, are the largest fire-boats ever built. They are also the first turbine fire-boats to go into commission.

The illustrations show the "Thomas Willett" and "James Duane."

The fireboat "Mills," located at the foot of Ninety-ninth street, East River, protects the Harlem River section, covering great lumber areas, also all the public institutions, State and municipal, on the islands in the East River.

The fireboat "Boody," located at the foot of North Eighth street, Williamsburg, covers the great plant of the Standard Oil Works, at Newtown Creek, the great cooperage works of the Sugar Trust, lumber and manufacturing districts around Greenpoint; also responds to all signal stations on Manhattan shore from Sixty-fourth street to Corlears Hook.

The fireboat "Strong," located at the foot of Grand street, East River, covers Manhattan shore, manufacturing plants, dry docks, coal pockets, lumber yards and coastwise and foreign shipping on both sides of the East River, from Forty-ninth street to Market street, on Manhattan shore, and the same distance on the Brooklyn shore.

The fireboat "Hewitt," located at the foot of Main street, Brooklyn, covers all the stores of the Pierrepont, Arbuckle and Havemeyer companies, all docks and stores, including the Navy Yard, to Atlantic Basin, on the Brooklyn shore, and from Corlears Hook to the Battery on the Manhattan shore.

The fireboat "New Yorker," located at the Battery, covers the great shipping on the North River, from the Battery to Fifty-ninth street. This includes the

largest of the coastwise steamers, all transatlantic lines, and the great stores adjacent to the docks.

The fireboat "Seth Low," located at the foot of Forty-second street, South Brooklyn, covers the great Bush Docks, Erie Basin, to Atlantic Basin, shipping in the bay, and Staten Island shore from Shooters Island to Stapleton.

The fireboat "McClellan," located at the foot of Gansevoort street, North River, lying south side of the great Chelsea Docks, protects them and all other docking, shipping and property adjacent to the river as far north as Mount St. Vincent.

The new boats will in all probability be located on the north side of the Chelsea Docks, and a boat will also probably be located at the ferry terminal at St. George, S. I.

The boats on the North River are charged by law with a duty of protecting life and property on the shores opposite Manhattan Island, as all the water of the Hudson River from opposite the Battery to Yonkers is included in New York Harbor. The combined pumping capacity of the entire fleet will amount to 75,000 gallons of water per minute. The average crew or company for operating boats is about fifteen men.

They cover all told a dockage and wharfage fronting New York Harbor of 541 miles.

The Increase of Accidents

INVESTIGATIONS made by M. Legoyt, sometime head of the General Statistical Department of France, show that accidents of all kinds are rapidly increasing. M. Legoyt found that in France, from 1841 to 1845, there were 22 deaths per 100,000 inhabitants from accident. From 1846 to 1850 the number rose to 24 for each 100,000; from 1851 to 1855 it was 25 for each 100,000; while from 1856 to 1860 it was 28 for each 100,000. This seems a large percentage, but the United States Census report for 1900 shows a tremendous increase in casualty. The accidental deaths recorded in this report had swollen to over 75 per 100,000 of population, from which ratio the increase has continued and is now at a still higher figure. When it is understood that the 100,000 is largely made up of young children and women, the percentage of fatal accidents among those engaged in gainful occupations and business men during the most active ages is very considerable. In far too many cases it is true that modern civilization, with its impatience, its feverish activity, its wild rush, its fast means of transportation, the diversities of occupation and wide range in recreation, together with its congested areas and enormous expenditure of energy, are paid for with human life.

THE NEW FIRE-BOAT "JAMES DUANE."

Financial

New York Bonds

NEW YORK CITY'S bond offering on the 28th was a failure, to the great disappointment of the municipal authorities. Until a few weeks ago the city was restrained by law from offering its securities at a rate of interest exceeding 4 per cent., and from accepting bids below par. Under a new statute, it is now permitted to make a higher rate of interest, but in this instance the Comptroller would not go beyond 4 per cent. The offering was $27,000,000 at fifty years and $2,000,000 at ten years. There were bids for only $2,121,840, including $1,932,840 (fifty years) at an average of 100.091, and $189,000 (ten years) at an average of 100.02. Nearly all the subscriptions were for small amounts. Much discussion was provoked by the result. The explanation is that investors can do better. New York 4 per cents. already issued were selling below par, and bankers would not buy fresh issues above par with no prospect of disposing of them at a profit. For some time past the market price of these securities has been declining, in the face of an increase of the interest rate, owing to the extraordinary demand for loanable funds and the rising prices paid for the use of them. The city's credit is good, but as it is forbidden to sell its bonds below par it may be driven to make the interest rate a little higher than 4 per cent.

Express Companies' Business

AT the recent session of Congress, the Senate passed a resolution for an investigation concerning the buying and selling of produce by express companies. That investigation is now in progress. Last week, the American Bankers' Association filed with the Interstate Commerce Commission a complaint against all the large express companies, alleging that they are encroaching unjustly and illegally upon the legitimate business field of the banks, and are departing from the purposes for which they were organized, by engaging in the business of dealing in exchange by means of letters of credit, money orders, travelers' checks, etc. It is also alleged that the companies unjustly use their facilities as common carriers to discriminate against the banks in competition for banking business, forcing the banks to make unnecessary and expensive shipments of money over long distances in order that the money may be available at points where the companies do not keep supplies large enough to meet their own banking obligations. In the next Congress there will be a movement for legislation restricting the express companies to the business of carrying goods. In opposing this movement the companies can rely upon no popular support. Rates which have enabled them to accumulate huge surpluses and to declare 200 per cent. dividends have not commended them to the public.

....Dividend and interest payments due in this country on July 1st, according to the estimates of the *Journal of Commerce*, amount to $182,881,849, which exceeds last July's total by $18,573,000, and is greater than that of any July in the past.

....A powerful combination of steel manufacturers is soon to be completed in Great Britain. Nine large companies, led by Vickers Sons & Maxim, and including John Brown & Co. (which recently was merged with Harland, Wolff & Co.), have absorbed thirty-six previously independent concerns, thus obtaining control, it is estimated, of about 90 per cent. of the British steel output.

....The ninth annual edition of that excellent book of reference, "The Directory of Directors in the City of New York," compiled and published by The Audit Company, of this city, has just come from the press. It contains the names of more than 25,000 directors, associated conveniently with the names of their companies or firms; selected lists of corporations engaged in banking, insurance, transportation, manufacturing and other lines of business, accompanied by the names of their officers and directors, and a list of the principal exchanges, with their officers and managers. The book is a very creditable product of a strong and useful corporation, and should be in the working library of every business man.

VOL. LXIII NEW YORK, THURSDAY, JULY 11, 1907 No. 3058

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Battleship Fleet to the Pacific

Much interest has been shown both at home and abroad in our Government's plans for sending the entire Atlantic battleship fleet to Pacific waters. When the assertion was published in certain newspapers on the 2d that such a transfer was to be made, what was regarded as a positive denial was given out at Oyster Bay by Secretary Loeb, after a long conference with the President. He had no idea, he said, on that date, where or how the story originated. The President, he added, had not even considered the advisability of sending any ships to the Pacific. This denial was repeated in various forms. In Washington, Assistant Secretary Newberry said that if there was such a plan he had never heard of it. One version of Secretary Loeb's denial (as published by the Associated Press) was as follows:

"Mr. Loeb said that the report is without foundation, that such a movement has never been considered by the President, and that its consideration is not contemplated."

Secretary Metcalf, however, on the 4th, in Oakland, Cal., confirmed the report. "Eighteen or twenty of the largest battleships," he said to the press, would pass from the Atlantic around Cape Horn to Pacific waters, and would be seen in the harbor of San Francisco. He continued:

"I might have stated before leaving Washington exactly what I am saying now. But I thought, as the news concerned the people of the Pacific Coast, today would be an appropriate time to announce the plans. I have held all along that there was practically no significance in this movement, from a military standpoint. How long the ships will remain here I cannot say. I hope the talk of Japanese troubles and international differences will be dropped by the newspapers. I know of no reason why Japan and the United States should not be on the friendliest terms."

On the same day an official announcement was made by Secretary Loeb that for two years the Administration had been perfecting its plans for a long ocean cruise of the battleship fleet; that the cruise might "possibly be to the Pacific," or "possibly only to the Mediterranean or the South Atlantic," and that the ships would return after a few months. The movement is reported to have been the subject of a conference in the last week of June between the President and Secretary Metcalf, just before the latter's departure for San Francisco. According to the latest reports, sixteen battleships and two armored cruisers will go to the Pacific under the command of Rear Admiral Evans. European newspapers are commenting upon the projected movement in its possible relation to Japan, and it is in this relation that it assumes importance in the estimation of the greater part of the American daily press. Viscount Aoki and other eminent Japanese say that Japan will not regard it as an unfriendly act. There was published in Tokio, on the 8th, an interview with Admiral Sakamoto, who remarked that in case of war with Japan a majority of the American crews would probably desert, not being patriotic enough to fight. American naval officers, he also said, were brilliant figures at balls and other social gatherings, but were very deficient in professional training and practice.

Fourth of July Celebrations

On the grounds of the Jamestown Exposition, Independence Day was celebrated by the first annual reunion of the lineal descendants of the signers of the Declaration, by a military parade and by orations, the most prominent speakers being Governor Hughes, of New York,

and President Woodrow Wilson, of Princeton University. Vice-President Fairbanks was the orator of the day at Fergus Falls, Minn. Governor Folk spoke at Evansville, Ind. The use of fireworks caused no great conflagration, the loss by fires due to the celebration amounting, at last reports, to about $500,000. The casualty list, however, was longer than usual. Reports received by the Chicago *Tribune*, which has collected such statistics for several years past, show that 59 persons lost their lives and 3,807 were injured. The number of the dead will be increased by fatal cases of lockjaw, which are beginning to be announced. Several persons were killed by stray bullets from pistols or rifles. In New York, such was the fate of an Italian girl seventeen years old, who was shot down while she was combing her hair near a window in her home, and of a child who was playing in the yard at the rear of her father's house. In Chicago a child was killed in front of her father's door by a rifle bullet. A majority of those who suffered in New York were recent immigrants, Italians and others. One of these, a young man named Arthur Carrano, killed his aunt by a shot from a pistol, thinking that it contained only a blank cartridge. In his grief he at once committed suicide. Commenting upon the list of casualties, the London papers express amazement that the American people permit such a sacrifice. On Staten Island, now a borough of New York City, Italians celebrated the 100th anniversary of the birth of Garibaldi by dedicating a memorial building which incloses the cottage in which he worked as a candle-maker, more than fifty years ago. The most elaborate celebration abroad was the one in London, beginning with a reception (for which more than 5,000 cards were issued) at the residence of Ambassador Reid, and closing with a great banquet at which addresses were made by Mr. Reid, Sir Henry Mortimer Durand, Mark Twain and others. The princely hospitality of the American Ambassador is the subject of comment in the London papers, one of which remarks that his salary hardly pays for the floral decorations at his State dinner parties, and then goes on as follows:

"Never in its history has the American Embassy occupied such a prominent position as it does today under Mr. Reid. Its conspicuous social success during the last two seasons is a personal triumph for him. The grateful thanks of all Americans are due to Mr. Reid for having raised the Embassy to its present eminence at great personal expense. The list of brilliant entertainments given at Dorchester House since his accession is unprecedented. The house itself is one of the most magnificent private residences in London, and yet the rental paid by Mr. Reid, 5,000 guineas ($26,250) is a mere trifle compared with his total expenditure. His retinue of well-trained servants is the envy of more than one American multimillionaire who has been Mr. Reid's guest. The household itself is managed on almost royal lines, the Ambassador having created the novel post of comptroller for the Hon. William Walsh, son of Lord Ormathwaite. It is the duty of Mr. Reid's comptroller of the household to look after details of expenditure just as the King's comptroller controls the household expenditures at Buckingham Palace. A well known American woman, describing a recent visit to Dorchester House, declared that the splendor and formality which characterized the occasion would not have been more marked at a royal dinner party."

Traffic in several squares about Dorchester House was blocked for two hours during the reception. At the banquet, Mr. Reid referred as follows to our relations with Japan:

"Two great nations that have been friends from the beginning and that hold similar positions in their respective hemispheres are not going to hunt for a quarrel about small outbreaks in restaurants or barrooms, however much such incidents are to be guarded against and deplored. Nor will either of these nations quarrel for the privilege of transferring its surplus laborers from the open fields near its own borders, where they might help to extend the national power, to unoccupied fields on the other side of the globe, where it would have no use for them. Such fantasies would never occur to anybody in his wildest dreams, except for the pervasive and the perniciously industrious diplomacy of these later times."

Sir Henry Mortimer Durand said that the Americans were the warmest-hearted people in the world. While in Washington (as Ambassador) he had felt so entirely at home that he forgot he was a foreigner. But there was not much English blood left in the veins of the greater part of the American nation. "We should be better friends," said he, "if we would recognize the facts and learn to regard each other for what we are. Englishmen are apt to forget the facts and to be carried away by the idea of community of language and inter-

ests." Among those who attended the banquet in Paris were Senator Depew and Paul Morton. The latter's address was mainly in praise of President Roosevelt.

President Wilson's Address

No other address on the Fourth excited so much comment as that of President Woodrow Wilson at Jamestown. While the nation, he said, had had in every respect an extraordinary material development, the chief instrumentalities of that development had been at least virtually monopolized, and the people, altho they created the opportunity, had not shared the benefits of that development as they might have shared them. This was due not to the operation of our institutions, but to the operation of human nature. Those who gave the new nation voice and power had a profound regard for law, but were deeply jealous of too much law, because that would mean too much government and too little individual privilege. They desired to put the individual in the foreground, and to hearten him to make a free use of himself, with government as the umpire, depending upon law for nothing but a clear establishment of the rules of the game. That was hardly our notion. We seemed to say that the individual had eluded us, had merged and hidden himself in corporations and associations thru the intricacies of which we had not time to thread our way in search of him. And so we were dealing with the corporation, not with the individual, and were punishing corporations by fines, accepting the morals of business as corporate morals, not as individual morals. When we impose fines, said he, we merely take the money out of business. All the while "we know perfectly well that the iniquities we levy fines for were conceived and executed by particular individuals who go unpunished and even unchecked." Could we return, he asked, to our old standards? Undoubtedly we could, by finding the individual with the probe of morals and with the probe of law:

"One really responsible man in jail, one real originator of the schemes and transactions which are contrary to the public interest lodged in the penitentiary, would be worth more than the mulcting of a thousand corporations in fines, if reform is to be genuine and permanent. It is only in this way that we can escape Socialism. Unless we can single out the individual again and make him once more the subject and object of law we shall have to travel still further upon the road of Government regulation which we have already traveled so far, and that road leads to State ownership. The elaborate secret manipulation by means of which some of our so-called 'financiers' get control of a voting majority of the stock of great railroad or manufacturing companies in order to effect vast combinations of interest or properties, incidentally destroying the value of some stocks and fictitiously increasing the value of others, involves first or last acts which are in effect sheer thefts, making the property of thousands of stockholders so much waste paper, or arbitrarily decreasing the relative earning capacity of corporations for a share in whose earnings thousands of men and women had paid hard-earned cash; but we have never sought to bring the details of these transactions within the definitions of the criminal law. Not to do so is like overlooking the highway robberies of the medieval barons."

By statutes carefully drawn, every corporation could be obliged to make such public analysis of its organization as would enable both private individuals and officers of the law to fix legal responsibility upon the right person. The vast majority of our business transactions were sound, and the vast majority of our business men were honest. To clear the way of unjust suspicion and give credit where credit is due, we should single out individuals and fix real personal responsibility:

"There is no other possible formula for a free government than this: that the laws must deal with individuals, allowing them to choose their own lives under a definite personal responsibility to a common government set over them; and that government must regulate, not as a superintendent does, but as a judge does; it must safeguard, it must not direct.

Governor Hughes, in his address, pointed with satisfaction to the increasing demand of the people for more faithful representation in the administration of government, and for the better performance of public obligations by great corporations. Political leaders who acted as clearing houses for legislation and who served under a retainer of special interests were passing from the stage:

"The indignation that has been felt with reference to the conduct of transportation companies has been due on the one hand to the efforts they have made to attain their ends by debauching the administration of government, and on the other hand to their failure to

perform their obligation in giving fair and impartial service. Their misuse of the privileges which the people have bestowed, their manipulation of securities, their malign influence in legislative halls, have had their natural result in creating a deep feeling of public resentment. This feeling is most wholesome."

Vice President Fairbanks said that fair play for every citizen must be secured. Governor Folk complained bitterly because the enforcement of railroad laws recently enacted in Missouri had been prevented by the "despotism" of the Federal courts.

Mr. Rockefeller in Court

John D. Rockefeller was found by United States Marshal Charles L. Frink on the 3d at the summer home of his daughter, Mrs. Prentice, near Pittsfield, Mass., and the subpena issued in Chicago by Judge Landis was served upon him. He promised to be in court on the 6th, altho, as he said, he had been hoping that his attorney, by procuring a modification of the order, would enable him to avoid the journey. It was with some difficulty that Mr. Rockefeller was found. Marshals had been on the watch for him in Cleveland, Lakewood and New York. There is conflicting testimony as to the end of the search. John D. Archbold, vice-president of the Standard Oil Company, says that Mr. Rockefeller sent word to Marshal Frink "that if he had a subpena to come and serve it." But Marshal Frink asserts that he found Mr. Rockefeller only by a ruse, having received from the latter no information that could assist him in serving the papers. There was a great crowd in and about the court room when Mr. Rockefeller testified, on the 6th. His position, as president of the company, he said, was purely an honorary one, as he had rendered no service for about ten years, and in the last eight years had not visited the company's office. The company's capital was approximately $100,000,000, and its annual dividends in the three years to which the suit related had been about 40 per cent. He did not know what the net earnings had been. About the company's business he appeared to know very little. The company refined oil, but he couldn't say where its refineries were or how many it had. Judge Landis then questioned Charles M. Pratt, the company's secretary, who testified that the capital was $98,300,000; that the dividends in the three years had averaged about 40 per cent., and that the net earnings had largely exceeded the dividends, having been $81,300,000 in 1903, $61,500,000 in 1904, and $57,000,000 in 1905. The company's properties, he said, were worth "vastly more" than the par value ($98,300,000) of the capital. He showed that the Indiana company (recently found guilty and soon to be sentenced) was controlled by the parent company in New Jersey. Judge Landis asked whether the company's counsel desired to offer any evidence tending to show that neither of the companies had ever before violated the Interstate Commerce law. Answer to this was deferred. Judge Landis is permitted by the statute to impose fines amounting to $29,400,000. After the hearing, Mr. Rockefeller and Mr. Archbold, thru their counsel, issued a statement, asserting that since the enactment of the statute, in 1887, the company had carefully observed its provisions and in no case had wilfully violated it; that the old system of special rates and rebates was obnoxious and had never been a source of profit to the company; that the company had been a blessing and not a bane to the country; and that "its downfall thru any cause would be a national disaster."

Registration in the Philippines

The registration of voters for the election, on the 30th inst., of members of the new Legislative Assembly of the Philippine Islands, was quite disappointing. In Manila the number of those registering was only 7,902, and 856 of these were Americans. It had been expected that at least 18,500 in that city would put their names on the lists. In all the islands there are 784,095 men of voting age who can read, and 539,749 who can read and write. A conservative estimate was that 130,000 (10,000 Americans included) would register, but the record made in Manila indicates, it is said, that the total does not exceed 55,000. Despite the efforts of native leaders to excite interest in the approaching election, the Filipinos remained apathetic. One Manila newspaper sees in

the registration an indication that if the islands should become independent, the laws for the 8,000,000 of people would be made by a few men. Another says that the new Assembly will not be a representative body. Raphael Dimayuga, a young Filipino of good family, who has been in this country for the last two years, becoming familiar with railway practice by actual service, was urged by Aguinaldo, formerly leader of the insurgents, to accept a nomination for the Assembly. He declined.

Central American Countries

Conflicting reports as to the situation in Central America are published. Those received from Mexico assert that President Cabrera, of Guatemala, is a tyrant and a monster; those from the capital of Guatemala make him a patriot, beset by assassins and wicked revolutionists. In one dispatch it is asserted that the recent raid of Zelaya's Nicaraguans upon the port of Acajutla (Salvador) and the neighboring town of Sonsonate was a failure because General Alfaro, the revolutionist leader, failed to meet the raiding party; in another it is stated that Alfaro was one of the raiding party's commanders. It appears that there was some hard fighting. The invaders lost 200 in killed and wounded, and 45 of Salvador's soldiers were slain. Zelaya is preparing for further attacks of the same kind, but no additional aggressive movement has been reported. Refugees from Guatemala say that President Cabrera recently arrested and imprisoned 160 prominent and wealthy citizens for complicity in the attempt to assassinate him, and that the resident diplomats (the representative of the United States excepted) have protested against this action. It is asserted that in the last few months more than 1,000 of his opponents have suffered death at the hands of his agents, and that there is a reign of terror in Guatemala. There is general agreement in the opinion that wars and revolutions in Central America for some time to come must be expected.——Elaborate preparations are being made in Mexico for the approaching visit of Secretary Root, the political significance of which is not clearly seen.——At a recent conference in New York, attended by Panama's counsel (Mr. Cromwell), Colombia's Minister (Señor Cortez) and Secretary Taft, progress is said to have been made toward a settlement of the controversy between Colombia and Panama, which relates to the secession of the isthmian province.——It has been decided that the office of the Secretary of the Isthmian Canal Commission shall be on the isthmus. Secretary Bishop, who has remained in Washington, will go to Panama.

The Hague Conference

The reports from the Peace Conference are marked by a tone of discouragement and pessimism. The number of changes in the rules of war proposed are so numerous and the interests involved are so conflicting and important that it seems hopeless to expect that an agreement on these proposals will be reached in a reasonable time, and there is no manifest disposition to enter upon such larger questions as general disarmament and compulsory arbitration. Mr. Choate's proposition for the immunity of private property at sea has no chance of being adopted. The amendment offered by the Italian delegation, retaining the right of capture, but abandoning the right of confiscation, met with more favorable consideration, but was opposed by France and Russia on the ground that it would give an unfair advantage to a maritime power like Great Britain, which had ports all over the world where captured vessels could be kept until the war was over, while less fortunate powers must let the ships go or sink them and pay for them. Germany has introduced the following propositions in regard to irregular combatants:

"Volunteer forces must be provided with uniforms visible at a distance except in the case of a rising of the population. In such cases the people must carry arms openly. Nobody shall be forced to fight against his own country. The inviolability of private property on land shall be extended to contractual obligations."

Other subjects to be discussed are the neutralization of submarine cables and the regulation of wireless telegraphy. On July 4th Count Nelidoff, president of the Conference, received from Anna Eckstein, of Boston, a petition signed by over 2,000,000 Americans in favor of general

arbitration. In his reply Count Nelidoff said that, altho the Conference might prefer to deal indirectly instead of directly with the armament problem, it would never lose sight of the final object of the Czar's rescript. A delegation of Koreans is endeavoring in vain to gain recognition at the Conference in order to present their charges against the Japanese for having robbed them of their independence, in violation of treaty obligations. Marquis Ito, the Japanese Resident Adviser at Seoul, has forced the Emperor of Korea to disavow the delegation.

The Irish Question

It has been found practically impossible to convict the Irish peasants who have been driving the cattle from the grazing land. Those arrested were dismissed by the local magistrates and when the cases were carried by the Attorney-General to the Assizes the juries in all cases disagreed. The Irish are likely to attain their object by the means they have adopted, for the lands made useless for grazing by their activity are being sold to the Land Commissioners for division among the people.——The shipping strike in Belfast is still unsettled and is assuming a dangerous character. Both infantry and cavalry are employed to escort drays carrying goods to the ships. The Dock Laborers' Union threatens to call out all its members, and a general strike may be declared. The shipowners refuse to meet the representatives of the union in conference.——The Irish are revenging themselves on the Liberals for not granting them home rule by running candidates against them in English elections. In the election for a Parliamentary vacancy in the Jarrow division of Durham. Here an Irish Nationalist, Alderman O'Hanlon, was nominated, and altho he received the lowest vote of all four candidates, it was enough to defeat the Liberal nominee, S. L. Hughes. The Labor candidate, Pete Curran, was elected by a majority of 758 over Patrick Rose-Innes, a Unionist lawyer and tariff reformer. Mr. Curran is a trades union official and a Socialist. This district has been represented since 1885 by Sir Charles Palmer, a Liberal shipbuilder, and was regarded as a perfectly safe Liberal precinct. The result is held by the Unionists to indicate that Sir Campbell-Bannerman's majority is disintegrating by the withdrawal of the Irish and Labor support and that the fall of the Ministry will not be long delayed.

Transvaal Labor

The current session of the Transvaal Legislative Assembly is of especial interest, as it is the first trial of home rule under the new constitution, and the government is in the hands of those who a few years ago were fighting desperately against British supremacy. The Het Volk, the Boer party, outnumbers the English members two to one in the Assembly, and the Upper House—which, being nominated by the Governor, is of the opposite political complexion—has already proved a futile piece of legislative machinery. A constitution of the same liberal character has been granted the Orange River Colony, by which every man is entitled to one vote after six months' residence. In the British House of Commons Mr. Lyttelton criticised the Government for turning over the government to its former enemies too precipitately, and on such liberal terms, for neither of the two colonies had universal manhood suffrage before the war, nor do the other South African colonies have it yet. He charged the Transvaal Government with extravagance in at once making use of its newly acquired power by negotiating a loan of $25,000,000, and intimated that the Imperial Government had made a bargain with General Botha, agreeing to guarantee the new loan on condition that the Transvaal Government would get rid of the Chinese. There was already, he said, a state debt of $175,000,000 and a municipal debt of $40,000,000 burdening the country, which amounts to $700 per capita of the white population. Half of the loan was to be spent for the promotion of the agricultural interests, for irrigation, land banks and railways, yet 85 per cent. of the taxes were paid by the urban population, mainly British. At the same time the Transvaal Government was about to cripple the mining industry by depriving it of Chinese labor, for which no satisfactory substitute could be found, for the natives would also have to be indentured and confined, and their death rate was at least three times that

of the Chinese. In his reply to these strictures Secretary Winston Churchill said:

"We have reached the end of Chinese labor. It has been decisively condemned by the verdict of the local administration. The House is going to witness within a few days—certainly within a few weeks—the spectacle of live Chinamen in real ships steering Eastward. Upward of 17,000 will have left the country before Christmas, and Sir George Farrer, the leader of the Progressive party, speaking in the Transvaal Parliament, has admitted that it is inevitable that the rest should follow. We have been asked, Why did we leave it to the Transvaal Parliament, why did we not, feeling so strongly as we did on this subject, utilize our power from this country to remove the Chinese before the new Government came in? Until there was an election in the Transvaal no one had a right to assert what the opinion of the people of the Transvaal was. We might say that it was hostile to the Chinese, but it was open to honorable gentlemen opposite, it was open to our opponents in the country to assert—and I am bound to say they took advantage of their opportunity—that the Transvaal was strongly in favor of the retention of the Chinamen, that it would be ruined, or would even break out in rebellion if they were removed. Well, we were bound to await the verdict of the locality and of the community directly affected before this question could be settled. But we had faith that when there was an elected Parliament in the Transvaal that Parliament would declare against the principle of servile labor. What a vindication of the policy we have pursued. What a vindication of the action of those members of the House of Commons who in the last Parliament and in this have persisted relentlessly and tirelessly month after month in their hostility to the policy of Chinese labor, and who have shown such patience and extended such generous confidence to the Government. The repatriation of the Chinese will now be undertaken by those who have an absolute right to decide upon the question; it will also be undertaken by those possessing unrivaled knowledge of the facts. The present Transvaal Government is an authority upon the subject of the mining industry and of the supplies of native labor which are available, not to be rivaled by any other body in the world. Altho it is not a quarter from which I usually obtain much support or agreement, I observe, too, that the Money Market, which over wide areas is undoubtedly depressed at the present time, exhibits a buoyant tendency in that very South African area where we were told ruin and disaster would immediately break out directly any reference was made to the repatriation of the Chinese."

Anti-Foreign University Movement

In both Germany and Switzerland a pronounced anti-foreign propaganda is making itself felt in the higher educational world, based on the fact that the foreigners come to the universities and technological schools in such numbers that they crowd out the natives; and, still more, that they make use of the knowledge acquired at these schools to the detriment of German and Swiss trade and commerce abroad. The agitation is chiefly directed against Russians, and here again against Russian Jews and Jewesses. In Switzerland the foreigners considerably outnumber the natives in the medical faculties at the universities, and both here and in Berlin Russian students have been been recently expelled because of their anarchistic propaganda. The University of Zürich last year drew up a special set of rules making it more difficult for foreigners to become academic citizens; but still more than 50 per cent. of the Zürich students are non-Swiss. In Germany the propaganda was inaugurated at the technological institutes, where out of 12,000 no fewer than 2,701 last semester were foreigners, or fully 22.5 per cent. In Danzig the total enrollment in the Technological College was 2,042, but of these 617 were foreigners, and of these, again, 525 were Russians. The institute at Carlsruhe, in Baden, is also overrun with such outsiders. The agitation was started by protests of the students, who found that the preparatory training of the outsiders was inferior, and hence influenced the scholarship of a school in general. In the universities the status of affairs is not quite so bad; but still out of 45,136 students during the past winter semester, 4,151 were foreigners, or 8.6 per cent. The university authorities as well as the state governments are trying to devise ways and means to counteract this influx. In some cases the tuition and laboratory fees have been increased for foreigners; in other schools, foreigners are not allowed to be enrolled until German students have had the first chance during the early week of a new term; but these means so far have not accomplished their end. The matter has even reached the Reichstag, in which Chancellor von Bülow declared that the Government would not sanction an anti-foreign crusade as such, but would lend a helping hand to keep out the undesirable element. Some writers censure the university authorities because they make it too easy for foreigners to take degrees in German uni-

versities and schools of similar grades, and accept them as students with an entirely unsatisfactory preliminary training. The matter has practically become a national agitation, particularly in Germany.

Raisuli Kidnaps the Kaid

Raisuli, the Moroccan bandit, has crowned his career by capturing Kaid Sir Harry Aubrey de Maclean, the organizer and commander of the Sultan's bodyguard. General Maclean is a Scotch officer, formerly of the Sixty-ninth Infantry, who for many years has been in the service of the Sultan. The Sultan shocked his orthodox subjects by the favor and intimacy he granted to the foreigner and for indulging, under his influence, in such improper pleasures as automobiling and photography. In 1901 General Maclean was made a Knight Commander of the Order of St. Michael and St. George "for services rendered to the British Government." He married Miss Catherine Coe, and his matrimonial troubles were last year exposed in detail by the London *Times* in its verbatim divorce court reports. At the time of his capture he was acting as the special emissary of the Sultan to Raisuli and was carrying him gifts of horses and tents and a proffer of pardon for past offenses in the hope of winning him back from the Pretender, Bu Hamara, whom he joined a few months ago. The Kaid was met in the mountains of Beni Hassan, near Tetuan, by fifteen of Raisuli's men, who offered to escort him to their chief at Rouina on condition that he leave his own bodyguard behind. The Kaid complied, contrary to the advice of his friends, but when Raisuli met him he was told that he was a prisoner to be held as a hostage. According to one report the Kaid was treated courteously and his personal baggage sent for. According to another Raisuli made him dismount from his horse and ride a mule as a token of inferiority, and he was ordered to remove his turban, for it was improper for an unbeliever to wear one. It is reported that Raisuli's demands of the Sultan include a large money ransom, the reconstruction of his stronghold at Zinat, recently destroyed by the Sultan's troops, his appointment as Pasha of Tangier and as the Moroccan chief of the new Franco-Spanish police force, and the withdrawal to Fez of his old enemy, Sidi Mohammed Gabbas, Minister of War. The British Government has demanded that the Sultan obtain the prompt release of Kaid Maclean. Raisuli first gained international fame as a bandit by capturing Walter B. Harris, the Tangier correspondent of the London *Times*. In May, 1904, he kidnapped Ion Perdicaris, an American citizen, and his British son-in-law. For their release he obtained from the Sultan $55,000, and as his tribe increased he extended his power over Tangier until the foreign residents protested, when he was deposed and driven away.

Around the World in Forty Days

The famous record established thirty-five years ago by Jules Verne's globe-trotter has now been practically cut in two. An English officer, Lt. Col. H. Burnley-Campbell, completed the circle of the world by the northern route in 40 days, 19½ hours. If he had caught the St. Petersburg express at Berlin he would have reduced the time by several hours. The details of his itinerary are worth quoting:

"I sailed from Liverpool on May 3d at 7:20 p. m., in the Canadian Pacific Railway Company's steamer Empress of Ireland, Captain Forster. I reached Quebec May 10th, 3 p. m.; left Quebec by the Canadian Pacific Railway's oversea transcontinental mail train on the same date at 5 p. m., this train carrying the mails and first-class passengers only; arrived at Vancouver May 14th, 5 a. m.; departed Vancouver May 14th, 12:30 p. m., by the Canadian Pacific Railway's mail steamer Empress of China, Captain Archibald; arrived Yokohama May 26th, 5 a. m.; departed Yokohama May 27th, 7 p. m., by rail for Tsaruga; arrived at Tsaruga May 28th, 9:30 a. m.; departed Tsaruga May 28th, 6 p. m., by Japanese steamer for Vladivostok; arrived Vladivostok May 30th, 2:15 p. m.; departed Vladivostok May 30th, 7 p. m., by the trans-Siberian train for Moscow; arrived Harbin May 31st, 7:25 p. m.; departed Harbin May 31st, 8:30 p. m.; arrived Irkutsk June 4th, 6:30 p. m.; arrived Moscow June 10th, 2:38 p. m.; departed Moscow June 10th, 6 p. m.; arrived Warsaw June 11th, 9:30 p. m.; departed Warsaw June 11th, 11:30 p. m.; arrived Berlin June 12th, 11:35 a. m.; departed Berlin June 12th, 11:40 a.m.; arrived Cologne June 12th, 9:8 p. m.; departed Cologne June 12th, 11:15 p. m.; arrived Ostend June 13th, 7:30 a. m.; departed Ostend June 13th, 11 a. m.; arrived Dover June 13th, 2:50 p. m."

The Calling of the Second Conference of the Hague

BY THE HON. RICHARD BARTHOLDT

[Every one knows that Congressman Bartholdt, of Missouri, a German by birth, who came to this country when a boy, has taken the greatest interest in international arbitration and the meetings of the conferences at The Hague, where he is now in attendance. He is President of the Interparliamentary Union for Promoting International Arbitration. No one can speak on this subject with greater authority.—EDITOR.]

AS an humble participant in the preliminaries which have led up to the Second Hague Conference, I am being frequently asked the question how this approaching Congress of Nations came to be called. The story has never been told in detail, tho certainly interesting for at least two reasons, first, because, irrespective of results, the main significance of that great international council lies in the fact of its mere meeting, and, second, because the meeting is mainly, if not solely, due to American initiative.

In order to tell the story chronologically we must go back to the Conference of the Interparliamentary Union, held in Vienna in August, 1903. At that time the American Congress had not yet become a member of that great international organization of lawmakers, but as any member of any national legislative body has the right, according to the constitution of the Union, to join it, I had had my name enrolled as an individual American representative at its 1899 meeting at Christiania, Norway, the same as Samuel J. Barrows, of Massachusetts, had done several years before. At the Vienna conference in 1903 I happened to be, thru the absence of Mr. Barrows, the lone delegate from America, and as we were then inviting the whole world to come to the United States and visit the great World's Fair, in St. Louis, I took it upon myself, without authority from anybody, to extend an invitation "on behalf of the American people," to the six hundred lawmakers, representing twenty-odd parliaments, to hold their next or twelfth conference on American soil in 1904. The very fact that an international exposition was to be held in the United States in that year, which I supposed would prove a strong inducement for the acceptance of my invitation, gave the opponents of my plan a cue, and among others William Randal Cremer, of England, the founder of the union, objected strenuously on the ground that it would never do to trail that dignified body in the dust by using it "as an advertisement for a show." This was in the executive committee or what is called the Interparliamentary Council, but when the question came up in the conference itself I found myself strongly supported, in my task to disarm the opposition, by the general desire of members to visit America, so strongly that I finally carried the day. As a result 240 members, representing fourteen different parliaments, came to the United States in the following year, attended the St. Louis Conference, and were entertained as the guests of the nation for more than three weeks. To describe in detail how this was accomplished would lead me too far and is immaterial for the purpose of this historical account. Suffice it to say that, upon my humble initiative, a group or branch of the Interparliamentary Union was organized in our Congress, and an appropriation of $50,000 was secured to defray the expenses of properly entertaining the distinguished visitors from abroad. While at Vienna, after the victory had been won, I was tempted to exclaim with Pyrrhus: "Woe to me, I have won!" It turned out that I had not miscalculated when I had implicitly relied on the proverbial hospitality of the American people, and today it is a matter of just pride for all of us that our foreign guests sailed home with feelings of enthusiasm

bordering on ecstasy. But while the preparations for the great St. Louis Conference were going on, I received a letter one nice morning which proved a distinct shock to me. It was from Dr. Gobat, the general secretary of the union, in Berne, Switzerland, who reminded me that it was incumbent upon the American group, since they were to be the hosts, to formulate a program for the conference. What was I to do? At that time there were very few people in the country who knew anything about the Interparliamentary Union, and there were not more than a half a dozen members of Congress who took an active interest in its affairs. In other words I could think of no one whom I could consult on the matter, hence my only alternative was to hurriedly read up on the subject of the First Hague Conference and on previous Interparliamentary meetings. One night, reading F. W. Holl's book on the 1899 Conference at The Hague, I came across the story of how the delegates had recommended the holding of a subsequent conference for the consideration of the questions which were to be the unfinished business of their first meeting. This proved to be the cue for what is now called in diplomatic circles "the historic resolution of St. Louis." When I penned that resolution it was perfectly clear to me that no headway could be made in the direction of more permanent peace by flying into the faces of the military powers of Europe with propositions looking to disarmament or even an arrest of armaments. As reasonable as this latter plan might appear, especially in the light of the enormously growing burdens of the people resulting from "war preparedness," the first Hague Conference had taught us the lesson that certain governments would never consent to such a weakening of what they regard the safeguards of their national security. Right or wrong, they took that stand in 1899, and no doubt will do so again in 1907. Hence it is a condition, not a theory, that confronts the friends of peace and justice, and if real progress is to be made I believe it to be the part of wisdom to proceed along different lines, along lines of less resistance. They are indicated in the "Resolution of St. Louis," the text of which I will here insert, and without which my story would be incomplete. It is as follows:

"Whereas, enlightened public opinion and modern civilization alike demand that differences between nations should be adjusted and settled in the same manner as disputes between individuals are adjudicated namely, by the arbitrament of courts in accordance with recognized principles of law, this conference (St. Louis, September, 1904) requests the several governments of the world to send delegates to an international conference to be held at a time and place to be agreed upon by them for the purpose of considering:

"1. The question for the consideration of which the conference at The Hague expressed a wish that a future conference be called.

"2. The negotiation of arbitration treaties between the nations represented at the conference to be convened.

"3. The advisability of establishing an International Congress to convene periodically for the discussion of international questions.

"And this conference respectfully and cordially requests the President of the United States to invite all the nations to send representatives to such a conference."

There was considerable wrangling over the program indicated in the resolution, and when the committee to which it was referred met to consider it, there was danger of its material modification. Some delegates wanted paragraph 3, relating to an international congress, stricken out, because it seemed to them a proposition too radical and far-going; others insisted on an amendment covering the disarmament problem; but an inner voice told me not to yield to any modification, and so I appeared before the committee as President of the organization and author of the resolution, and protested against each and every change or addition, and I had the satisfaction of finally seeing the resolution adopted by the committee and later by the conference just as it was written. The rest was easy; at least it proved so, thanks to the susceptibility, the courage, the wisdom of a wide-awake President. On September 24th I had the honor, in behalf of the delegates to the St. Louis conference and in their presence, at the White House, to present the resolution to President Roosevelt. The balance is told in the circular note of John Hay to the Powers in the following language: "The President accepted the charge offered to him, feeling it to be most appropriate that the Executive of the nation which had welcomed the (Interparliamentary) conference to its

hospitality should give voice to its impressive utterances in a cause which the American Government and people hold dear. He announced that he would, at an early day, invite the other nations, parties to The Hague conventions, to reassemble, with a view to pushing forward toward completion the work already begun at The Hague, by considering the questions which the first conference had left unsettled, with the express provision that there should be a second conference." In the same note our late Secretary of State communicated the text of the St. Louis resolution to the Powers in these terms: "The annual conference of the Interparliamentary Union was held this year at St. Louis, in appropriate connection with the World's Fair. Its deliberations were marked by the same noble devotion to the cause of peace and to the welfare of humanity which had inspired its former meetings. By the unanimous vote of delegates, active and retired members of the American Congress and of every Parliament in Europe, with two exceptions, the following resolution was adopted" (follows the text as printed above). As is well known, President Roosevelt made good his promise by issuing, under date of October 21st, 1904, a tentative invitation to the Powers to send delegates to a second Hague conference, and only left the further details to the Czar because that ruler had called the first. This brief story will convince the future historian, I hope, that the credit of calling that great congress of nations into being belongs to America, and is more particularly due to American members of Congress and of the Interparliamentary Union.

I should add a final word, perhaps, as to the whys and wherefores of the program for the second Hague conference, as outlined in the resolution above referred to. And, mind you, what was but crudely indicated in that resolution has finally been adopted, only in more perfect form, as the real program which the lawmakers of the world, voicing the wishes of the people, will present to the governments assembled at The Hague for consideration and adoption. The plan of an international congress has been wisely reduced to the proposition that the next conference be made a permanent body, with the right to meet periodically and automatically, for the purpose of codifying international law and discussing international questions such as the course of events may make paramount. No well-meaning government, it seems to me, can reasonably object, either to this proposition or to a model arbitration treaty, which refers all minor disputes to the Hague court and provides further that, in case of vital differences, such as may affect the independence, honor or vital interests of nations, the contending parties shall first consent to an impartial investigation of the cause of their controversy before war is to be declared. And these are the two cardinal demands of the Interparliamentary Union. Originating in the mind of an humble member of the American Congress, they have been thrown into the crucible of conservative European opinion, and, after most exhaustive discussion at the Brussels and London conferences of the Union, they emerged as a moderate, practical and most timely program for The Hague. Instead of calling for an arrest or a reduction of armaments this program merely tends to create a judicial machinery for the peaceful settlement of controversies between nations and substitutes a system of law and justice for arbitrary power in international relations, the same as every civilized nation has long ago provided for the settlement of disputes within its domain. It is based upon the just presumption that if arbitration by courts of justice is right and proper *within* a nation, it must be right and proper if extended to affairs *between* nations, and its ultimate aim and inevitable result is the gradual elimination of the element of force and the automatic, not forcible, reduction of armaments as the natural sequence of changed conditions, which will render such armaments to a great extent unnecessary. The American delegates to The Hague are naturally expected to father this program, not only because it is of American origin, but also because John Hay, in his official note to the Powers, pointed to it as one of the arguments in favor of the international council which is now assembled in the capital of Holland. Its advocacy, in a word, means this: Let us have justice between the nations, and peace will follow as the day follows the night.

July

BY EVALEEN STEIN

FAR, far away, beyond the ripening wheat,
The forests stand in mantles of soft blue;
While wreathed in music, near and heavenly sweet,
A lark soars singing from the meadow-rue.

Along the roads, where sheltering sumacs grow,
A few wild-roses linger and defy
The bright mid-summer, but the elders' snow
Has melted in the sunshine of July.

Thru fallow fields the scarlet fire-weeds flame
Like little Gheber shrines among the grass,
And with their blazing blossoms worship claim
From all the pilgrim butterflies that pass.

A drowsy languor tinctures all the air;
And in the garden, nodding o'er the wall,
Tall hollyhocks weave scented shadows where
From fragile stems red poppy petals fall.

Small, spicy pinks about the door-yard shine,
Bright orange lilies sway along the walks,
And thru the fence bold ragged-robins twine
And clamber up the tallest sunflower stalks.

A warm breeze stirs the cedars and floats thru
The feathery willows; while within the sky,
As white as wind-flower buds against the blue,
The summer clouds go slowly blowing by.

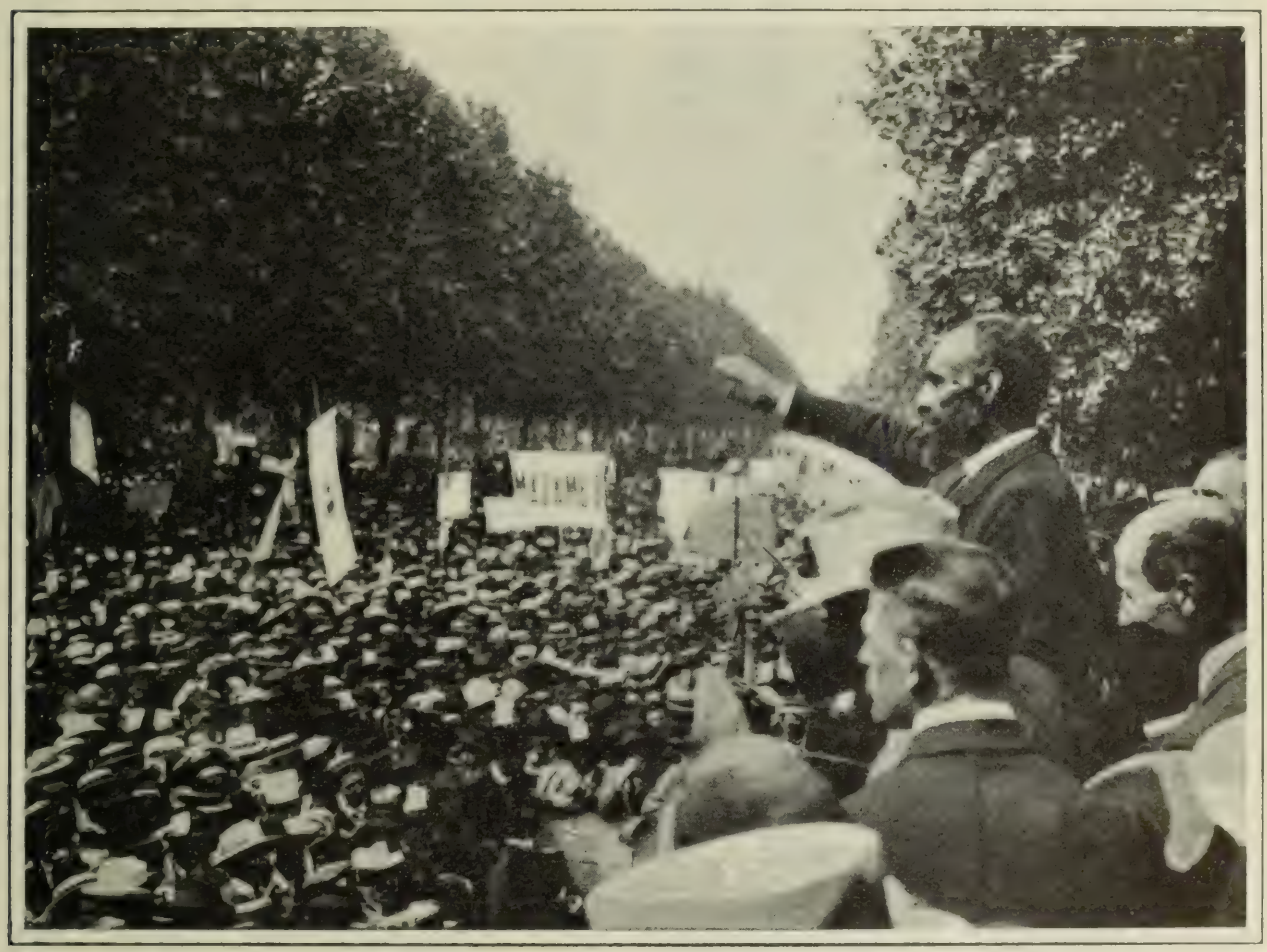
So honey-sweet the earth is, and so pure
The tender heaven bending overhead,
I think no heartache here could long endure,
Nor any pain remain uncomforted!

LAFAYETTE, IND.

The Wine Revolution in France

BY LOUIS WINDMÜLLER

[The writer of this article is an old New York merchant, who has spent much of his time in Southern France, and who is connected with various important benevolent institutions of this city.—EDITOR.]



FRANCE occupies among wine-producing countries the foremost rank, and the French enjoy the prestige of being among the first of civilized nations. The quantity of wine annually produced in France, about one and a half billion gallons, exceeds one-third of the wine yielded by the world. The city of Paris alone consumes as much as the population of the United States.

It is impossible to imagine a convivial gathering of French people without wine. The alcohol created by natural fermentation of the must seldom exceeds 10 per cent. and produces that natural claret, which of alcoholic beverages is the most wholesome.

Of the agricultural products in the South of France, wine is more valuable than all others combined. The vintner and his family depend entirely on the profit of their vineyards. Some thirty years ago, when, by ravages of the phylloxera, the yield was diminished, prices of natural wines rose and the manufacture of imitations to supply the trade was initiated. Previously adulteration had chiefly been practiced for the use of "buvettes," in large cities; their patrons, the men in blouses, could not afford the prices of natural French wines when the city tax or "octroi" was added. But even "piquette" had a claim to the name of wine; it was so called, because it consisted of water steeped in the dregs from which the first liquor had been drawn, and the second brew had been squeezed. When sweetened, rectified with glucose, and tinted with aniline, this beverage was served by restaurateurs as "vin ordinaire," with "dejeuners" which they furnish with "wine" for francs 1.25, or about 25 cents.

After production of the real wine had

been reduced to one-third of the former volume and it became difficult to get it on reasonable terms, falsification began to be practiced by unscrupulous dealers and sham vintners in almost every department of France on a large scale. Counterfeiters not alone "blended" native wines of the Loire, Garonne and Rhone with Spanish and other cheap foreign vintages, but they "fortified" them with potato spirits and sweetened them with beet sugar. Dyestuffs and drugs were

MARCELLIN ALBERT ADDRESSING THE CROWD AT MONTPELLIER.

used to give their concoction the color and aroma of famous Bordeaux vintages such as Chateau Lafitte. Imitations were skillfully made so as to deceive even pretended experts, and often the fraud was not detected until the vile stuff was imbibed; nausea and headache then first demonstrated to the victim to what extent he had been swindled. The unscrupulous tricksters made fortunes at the expense of consumers, and the fair fame of the best drink ever made to cheer the human mind was injured.

Meanwhile hardy American grape-vines, which could not be attacked by the phylloxera, were planted, and improved the conditions of the French vineyards; their yield gradually increased and is almost as large now as it has ever been. But in the years of scarcity wine-growers had lost customers; they are now confronted with an unsalableness of their product caused by the successful competition of substitutes for wine and by the compounds of the adulteraters who sell a spurious beverage called wine, with a finer flavor and superior color, at a price lower than genuine wine can be made for. When he could not for his honest liquor realize enough to pay for the barrels and was on the point of starvation, the vintner blamed his Government for the poverty to which he had been reduced. He believes that the Treasury winks at the falsifiers who pay a large portion of the millions which the French fisc annually gets for the duty on sugar.

The revolution of the French wine-growers reminds us of the unsuccessful "Whisky Insurrection," of 1791, when

the Pennsylvania distillers objected to the excise tax, because they found it an unfair discrimination against their industry. But the Monongahela moonshiners defied the law, while the French wine culturists invoke it. It is true that their methods to obtain justice were not commendable. They organized and defied the authority of the central Government; payment of taxes was suspended, magistrates and troops who refused to fraternize with the insurgents and to join them when they paraded the streets and cried for bread were ill-treated.

When all public offices were closed functions like the celebration of marriage were prevented. As it was too expensive to march to Paris in a body, Marcellin Albert, able leader of the uprisers, and other delegates were sent to Clemenceau to demand punishment of wine forgers. They further submitted a request that rations of the wine which the French Army gets be increased so as to relieve their destitution by the purchase of their liquor. We must bear in mind that similar claims have often been made, and that on the occasion of former French revolutions they were generally successful.

If the laws of France punish adulterators of wine, they have not been enforced with severity, such as prevails in Germany. A dealer near Mayence, who recently was caught in the act of selling spurious Johannisberger, had to pay a fine of a thousand marks and to spend a month in the workhouse. His vats were unceremoniously hauled from his cellar-bins and emptied into the gutter.

A resolution to inflict a similar punishment on French wine adulteraters has recently been adopted by the Chamber, and it seems to have calmed the minds of the insurgents already. When conscientiously carried into effect it will satisfy the vintners that their Government at least can no longer be blamed for their distress; and when their dishonest competitors are put out of business, they may find a better market for the honest juice of their generous grapes. Such result would not alone benefit all consumers of wine, but it would strengthen the French administration which has, by forbearance and wise measures, accomplished it.

New York City.

The Rhodes Scholars at Oxford

BY C. F. TUCKER BROOKE

[Mr. Brooke is the first Rhodes Scholar appointed from West Virginia. He went over in 1904. He received the degree of A. B. from the University of West Virginia in 1901 and A. M. from the same place in 1902. He was a Fellow in German at the University of Chicago in 1903-04, and was awarded a first class in the final examinations for the Oxford B. A. degree in the honor school of English language and literature last June, and this year will receive the degree of Bachelor of Letters.—Editor.]

DURING the coming summer there will return to the United States thirty-five of her citizens, the survivors of the thirty-seven who, in October, 1904, came into residence at Oxford as the first of the American Rhodes scholars.

It is now more than two years and a half since the majority of them, each from a different State and totally unacquainted, sailed from Boston on the Cunarder "Ivernia," with visiting cards pinned to their coats to assist in their identification and a great fellow-feeling in their hearts at being companions in the unknown life before them.

The first separation came nine days later when a special boat-train from Liverpool put them out into one of Oxford's characteristically foggy nights, some to seek their respective colleges, rising gray and medieval in the dimness, with massive closed gates and iron barred windows, the more foresighted to bed at the hotels.

During the first term Oxford was a

great mystery and all engrossing; new experiences were continually arising, new conditions every day unfolding themselves, to which the newcomer must adapt himself if he was to enter genuinely and as an active entity into the life about him. And now, on the eve of departure, after as long and intimate acquaintance as any good American could desire, Oxford remains equally a mystery, tho "scouts" and proctors, bumping races, "schools," and Gothic architecture are taken as matters of course, and life goes on as smoothly and naturally as in any American college.

The two preliminary examinations past, the Oxford undergraduate is free to choose between a "pass" and an "honor" degree. In the former case he is examined separately in three "groups," selected from a large number of alternative subjects. The B.A. so obtained presumes certainly a smaller degree of proficiency than the corresponding degree from any reputable American college, and three-fourths of the Oxford students are "passmen."

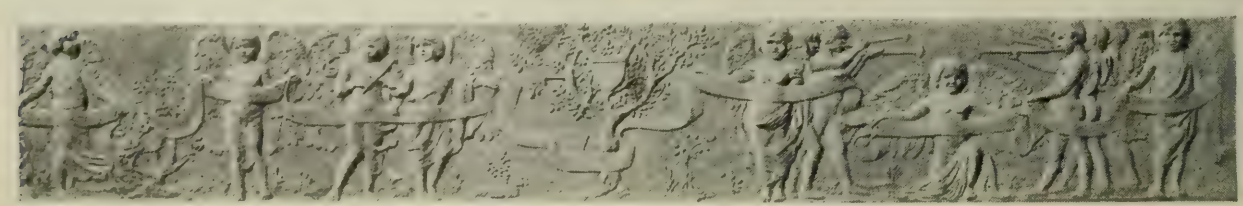
If the undergraduate be ambitious of scholastic distinction, he proceeds to an examination for honors; and here, by virtue of a highly developed elective system, he chooses one of the nine co-ordinate "schools" of Literae Humaniores, Mathematics, Natural Science, Jurisprudence, Modern History, Theology, Oriental Studies, English Language and Literature, and Modern Languages. Within each school there is further specialization, only one of the natural sciences, for instance, or one of the modern languages being studied. For the honor B.A. there is a single final examination lasting six hours a day for about a week, and followed by a *viva voce*. Successful candidates are divided into four classes, according to merit, and it is perhaps safe to assert that a position in the first or second class indicates a higher degree and kind of scholarship than any of our American A.B.'s.

The choice of one school rather than another is naturally in great measure a matter of taste, but the department of ancient history and philosophy, "Lit. Hum.," as it is irreverently abbreviated, is the oldest and, doubtless, in all respects the premier school, attracting the greatest number of promising English students. None of the Rhodes scholars have yet taken the final examination in this branch, but Messrs. Fobes of Massachusetts, Coon of Nebraska, Vincent of Ohio and Fleet of Virginia are candidates for it. Mr. Fleet, it may be added, is the only one of the Americans at Oxford to have stood the difficult and optional intermediate examination of Honor Moderations, in which he fell just short of a second out of five possible classes.

Quite equal numerically to "Lit. Hum." is the Modern History School, the examination in which was passed last June by Mr. Porter, of Maine. None of the other schools can compare with these two in popularity among the English undergraduates. Mr. Hilds, of North Dakota, was awarded a first class last year in the Geology branch of Natural Science, and Mr. Brooke, of West Virginia, the same class in the English school—one of the most popular with Americans—while Mr. Crittenden, of California, received a second class in jurisprudence. The Honor School of Oriental Languages, instituted for the benefit of the many Oxford students, who enter the Briareus-armed English Civil Service, is the only one not selected by any of the American Rhodes scholars. None have taken the Pass Schools, with the merely technical exception of Mr. Densmore, of Oregon, who is officially entered as a passman, that he may be free to engage in special research work in classical archeology, leading to the B. Litt. degree.

Tho the modern research degrees do not attract an appreciable number of the English students, they have, as might be supposed, appealed strongly to the Americans, as nearly all graduates are somewhat reluctant to waive their collegiate bachelorhood and return to regular tutelage and weekly essays, however different the Oxford method of undergraduate study. Mr. J. A. Brown, of New Hampshire, was last year granted the degree of Bachelor of Science in Physics, and has been appointed to the position of demonstrator at the University Laboratories. At the same time Mr.

R. Bevan, of Rhode Island, received the much coveted degree of Bachelor of Civil Law.



Nothing approaching a definite report of the scholastic career of the Rhodes scholars will be possible till the close of the present university year, as it has been only in isolated and somewhat exceptional cases that the all-deciding final examinations have been taken before the expiration of the usual three years. It may, however, be said pretty confidently that such results as so far have transpired have rather exceeded than fallen short of anticipation; that the initial distaste of the American students for the unfamiliar and—at least superficially—rigid Oxford methods has in great measure or wholly disappeared on better acquaintance, and that Oxford sentiment as a whole, tutorial and undergraduate, has regarded the infusion of purely American modes and ideals of study with a kindliness, which in so conservative a community only a very bold prophet would have predicted.

In the field of athletics the position of the Americans is more easily estimated, for the standard of what is to be expected of them in this same line seems, after a great deal of oscillation, to have reached a sane—and one may hope—a permanent equilibrium. The over-emphasis of the athletic clause of the Rhodes will by the newspapers on both sides of the water, together with the rather too suspicious début in Oxford sport—when at the freshmen's field day in their first term American Rhodes scholars won over two-thirds of the events—gave rise to some unfortunate misconceptions. All such misunderstandings have now entirely disappeared, and Oxford will no more expect of every member of succeeding generations of Rhodes scholars transcendent athletic prowess than it will require of each individual extraordinary scholarship or peculiar moral, social or political qualifications.

Two of the Americans, Mr. Schutt, of New York, and Mr. Young, of South Dakota, early won their "blues," and have twice represented Oxford University with much credit against Cambridge. The former is also a member of the University cross-country team. Mr. Sperry, of Michigan, has been seriously "tried" for the most difficult of attainment of all athletic distinctions at Oxford—membership in the "eight" that rows against Cambridge, besides having rowed for two consecutive years for his college (Queen's) during the intercollegiate "bumping" races; another member of the Queen's College eight during the last summer races was likewise an American, Mr. Vincent, of Ohio. Others who have rowed for their respective colleges are Messrs. Johansen, of Washington State, and Jacobson, of Utah, for Exeter; Bevan, of Rhode Island, for Worcester; Crittenden, of California, for Trinity; Sherburne, of Vermont, and Blodgett, of Missouri, for Wadham; Aydelotte, of Indiana, and Bush, of Delaware, for Brasenose; Brown, of New College, and Hack, of Massachusetts, for Oriel.

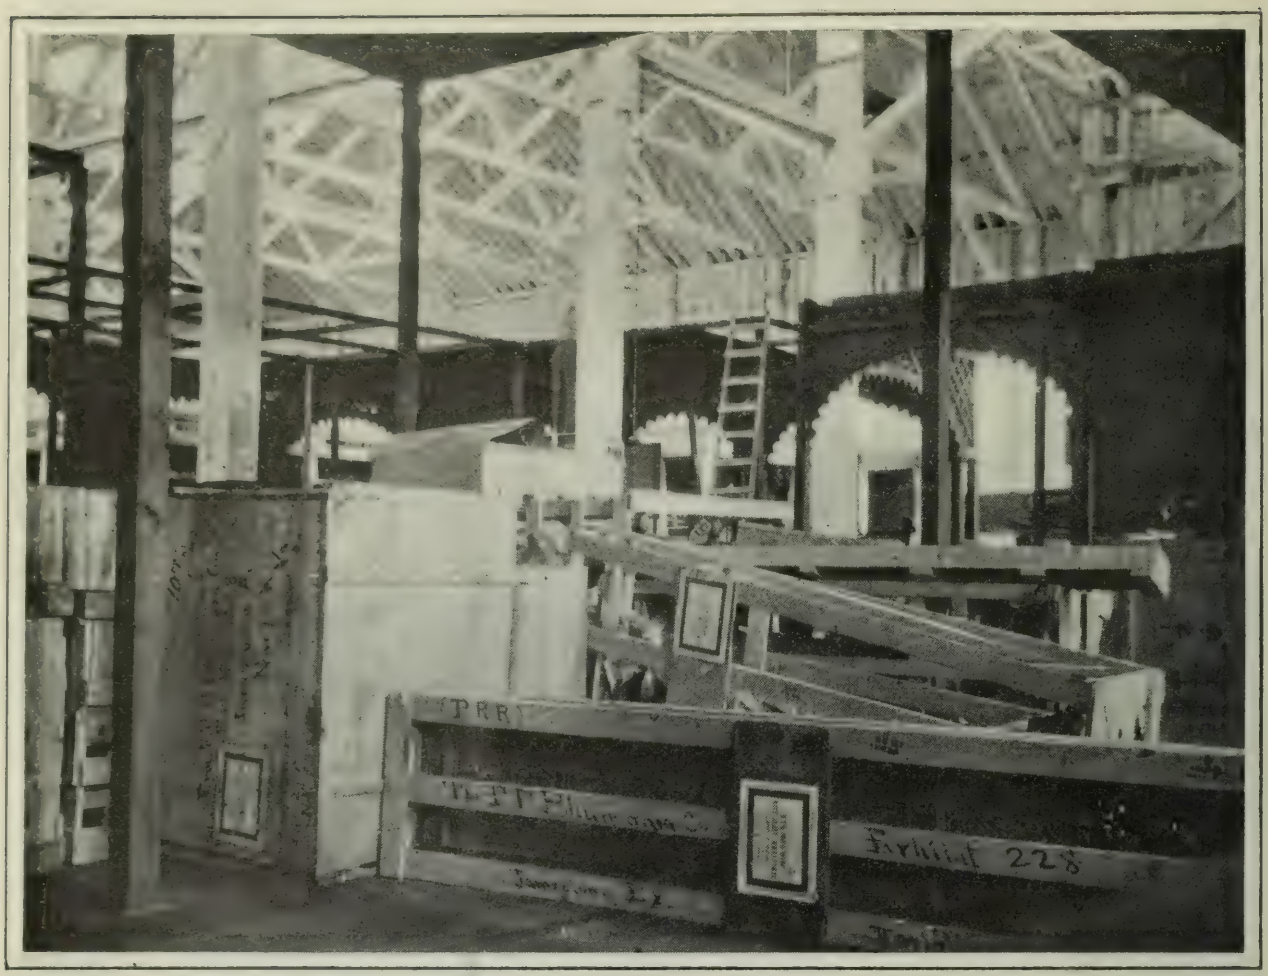
Rugby football has claimed many of the Rhodes scholars from the United States. Among those who have represented their colleges are Fleet, of Virginia, for Magdalen; Walleser, of Iowa, for Oriel; Carothers, of Arkansas, Tigert, of Tennessee, and Hamilton, of Indiana, for Pembroke; Scholz, of Wisconsin, for Worcester; Price, of New Jersey, and Lloyd, of West Virginia, for Wadham; and Aydelotte, of Indiana, for Brasenose. The Americans have taken readily to all the English outdoor sports except cricket. They can't obtain the proper regard for it for some reason. But they have given to the delighted aboriginal small boy the great American game of baseball, and their coolness on cricket is forgiven them.

OXFORD, ENGLAND.

What There Is at the Jamestown Exposition

BY EDWIN E. SLOSSON

"I NEVER go to expositions. There are always too many people, too much to see and it costs too much. If I could find an exposition that was comfortably peopled, moderately stocked with exhibits and reasonably inexpensive, I would go."



We have all heard people make remarks like this. Now is the time to test their sincerity, for the Jamestown Tercentennial is free from these common defects. The grounds and conveyances are not crowded. The exhibits are not so extensive or important as to burden the conscientious sightseer. The rates are not extortionate. But these are all negative qualities, and as such have little attractive power. Only Schopenhauerians hold that absence of discomfort is the highest happiness attainable by man. Whether the Exposition has enough positive attractiveness in itself to draw the crowds that would destroy these three advantages which it has over previous expositions remains to be seen. It depends on the individual. All that the reporter can do is to tell, as faithfully as he may, what there is to see at the Jamestown Exposition and let each one decide for himself whether or not it is worth going to.

Official Photograph.

THE PALACE OF MANUFACTURES AS SEEN BY NIGHT.

Each successive exposition has a more difficult task because it is popularly expected to surpass all its predecessors in all respects. This is obviously impossible, yet the disappointment of expectation

Photograph taken June 27

EXHIBITS ARE BEING INSTALLED IN THE LIBERAL ARTS BUILDING.

causes a reaction that prevents just appreciation. That is the reason why we hear so many visitors to Norfolk refering to it as "The Jamestown Imposition." These great fairs are held in different parts of the country, but they really draw from much the same class. They are people who have got the exposition habit. If they have missed one they speak of it in an apologetic tone that reveals an uneasy conscience. A considerable proportion of the men and women one meets at Jamestown are veteran sightseers. They talk from personal experience of Buffalo, Omaha and Portland. They allude familiarly to the fountains at St. Louis and the Ferris Wheel of Chicago, and even to the butter woman of the Centennial. These exposition-goers live chiefly in the Middle West, say from Ohio to Kansas. The people of New York and New England do not go much, nor have hitherto the people of the South. It remains to be seen whether an ostentatiously Southern exposition like the present will change their habits in this respect. At present the Northern accent is heard on the grounds as much as the Southern.

The Jamestown Exposition, by the way in which it has been placed before the people, especially by the send-off which the National Government has given it, has been put at a disadvantage by being classed with the great world's fairs of the past. It suffers from being compared, consciously and unconsciously, with these, particularly with the Louisiana Purchase Exposition, because it lacks some of their greatest attractions. The most conspicuous of these absences is the art gallery. There is probably nothing that has interested the common people more or been of greater educational value to them than the collections of paintings and statuary which have been a prominent feature of previous expositions. A fireproof building is now being completed at Jamestown which, according to the official guide, is to be devoted to "History, Historic Art and the Fine Arts," but apparently the objects that are

to be exhibited in it will be of more interest from the historical than the artistic point of view. The visitor misses, too, the decorative features which he has come to expect in exposition buildings, the bridges, fountains, monuments, groups of statuary, reliefs, gateways and portals. Our foremost sculptors have willingly taken part in such work and they have been well rewarded, for what they molded in staff has, in many instances, been made permanent in bronze or marble, and, what is more important, it has opened the eyes of the people to the possibilities of sculptural decoration, and by this has made a perceptible improvement in public and private architecture thruout the country. Staff and stucco are extensively used on the Jamestown buildings, in spite of the contempt expressed for such material in official literature, but there has been little done in the way of the plastic decoration of buildings and grounds. This has been excluded, according to the official guide, because it was not approved by the artistic taste of the managers, who, therefore, deserve great credit for their willingness to sacrifice so popular a feature rather than violate their esthetic consciences.

Another reason for the failure of the Jamestown Exposition to draw as large crowds as were expected is the absence of foreign exhibits. By claiming to be "State, National and International," it has given rise to the impression that one would see there displays of the arts and industries of the principal countries of the world, and there is a certain sense of disappointment in not finding them. Visitors at world's fairs have generally spent more time in the foreign booths and buildings than in the American departments, for the interest we take in a country is in inverse proportion to its nearness. Except for the warships that have visited Hampton Roads foreign nations have not participated to any noticeable extent in the Exposition. The Bureau of American Republics has an exhibit in one of the Government buildings,

Photograph taken June 27.

WORK ON THE PALACE OF HISTORIC ART IS PROCEEDING SLOWLY.

Mexico shows its munitions of war and Santo Domingo has erected a small building out of native woods in which the products of the island are being placed. A Japanese bazaar among the concessions is worthy of mention.

About twenty-five States are represented at Jamestown by buildings or exhibits or both. The State buildings are all completed or nearly so, except Michigan which, when I saw it the last of June, was being roofed and sided. They stretch along the whole waterfront and form a picturesque group of especial interest because they are mostly reproductions of historic edifices and good examples of various forms of colonial architecture. Thus Massachusetts and Rhode Island have their first State houses; Pennsylvania, Independence Hall; Kentucky, Daniel Boone's Fort; Maryland, the home of John Carroll, of Carrollton, etc.

In the Mines, States' Exhibits and Liberal Arts Buildings various States, railroads and development companies have exhibits of agricultural and mineral products and manufactured articles of the usual character. These were mostly in place at the end of June altho in many places the boxes were still unpacked. Such displays in previous expositions have had an important influence in directing the streams of migration and the investment of capital, and this one should do much for the development of the immense but unappreciated natural resources of the South. The exhibits in the Transportation, Machinery and Fisheries Buildings do not require special description.

The extent and character of the Pure Food Show is noteworthy for it is the first since the great adulteration scare and the passage of a national law requiring the correct labeling of all foods and drinks. The stress laid by the exhibitors on the cleanliness of their kitchens and

THESE TROLLEY CARS ARE THE PRINCIPAL MEANS OF TRANSPORTATION FROM NORFOLK TO THE EXPOSITION GROUNDS.

employees and the substitution of mechanical appliances for human hands in all stages of the manufacture shows that they have come to realize the importance of gaining the confidence of the public. A few years ago they were more arrogant. "Shut your eyes and open your mouth and take what I give you," was all they had to say to the consumer. I was glad to see that cotton oil is coming forward to claim its rights as a wholesome and variously useful food material. Hitherto it has been a timid creature, shrinking from appearing under its own name before a public to which it was a stranger, and therefore masquerading as "Superior Imported Lucca Olive Oil" or assuming a modest nom de plume like "Salad Oil." The Pure Food Building is the only one where crowds are found. This is due to the popularity of the peripatetic free lunch system. One can get a full meal here for nothing if he stands in the bread line, but it takes longer than a political banquet, about three hours to get from breakfast food and biscuits to ice cream and pickles, on account of the lectures that one has to listen to between courses. The portions served are even smaller than at an ordinary *table d'hote* and repeating is frowned upon.

The educational exhibits occupy two buildings on each side of the Auditorium; one pretty nearly in shape for inspection, the other still rather chaotic. Our schools and colleges are learning how to make a display attractive to the casual passerby and also convenient for the study of those whom it concerns, a difficult thing with this kind of material. The exhibits of Johns Hopkins University, the Woman's College of Baltimore, Teachers' College of Columbia University, the Ohio, Massachusetts and the Virginia schools of all kinds are especially noteworthy. The visitor will be particularly impressed by the progress made in recent years in drawing and designing, in manual training and in household economics.

There are two other good-sized buildings which will be of considerable inter-

INDIANS FROM THE 101 RANCH PARADING THE GROUNDS.

est later on when the exhibits are in place. One is devoted to aeronautics and the other to social science, sanitation, welfare work, trades-unions and the like. The Government buildings, ten in number, constitute so important a part of the Exposition that I must postpone consideration of them until next week. There is no complete official catalog of the exhibits and the guidebooks sold inside and outside the grounds are unreliable and fragmentary. So it is difficult to find what one wants to see; still I think I have mentioned the most important departments.

Except the Warpath. If we were likely to forget that, the megaphones and searchlights would call our attention to it. It is the lineal descendant of the Midway, the Pike and the Trail, and has the same short of shows, but it differs from them. Instead of being filled with a joyous and cash-reckless crowd, it is a lonely and a melancholy place. Wide is the gate and broad is the way, but few there be that find it. Whatever one's opinion may be as to the moral and intellectual value of such spectacles, one cannot help being touched by the despairing tones of the barkers' voices as they beseech the strollers and their muttered curses on their luck as they retire discomfited. Groups of a dozen or two gather about a free show of juggling or femininity, and then, instead of following the decoys into the booth, they pass on to the next impassioned orator. On one side the lion trainer forms his feral pyramid; on the other the Streets of Cairo offer all the delights of the Arabian Nights, but neither beauty nor the beast can draw coins from bare boards. If there were two or three hundred thousand people on the broad walk, as there are at Coney Island, the concessionaires would do well, for the shows are fully up to the average and some of them have considerable educational value. Of the war panoramas, the Fight of the Monitor and Merrimac naturally draws best, since the scene of the engagement is just off the Exposition

A TWISTED HEAP OF HALF-MELTED BEDSTEADS AND BATH TUBS IS ALL THAT REMAINS OF A PINE BEACH HOTEL AFTER THE FIRE.

THE STATE'S EXHIBIT PALACE AT THE JAMESTOWN EXPOSITION.

grounds. The Battle of Gettysburg—one is somewhat surprised to learn—gets twice the attendance of the Battle of Manassas, in which Generals Robert E. Lee and Stonewall Jackson are the leading figures. The Wild West show being unusually extensive, it sometimes happens that the cowboys and Indians outnumber the spectators.

But the exposition concessionaire is a buoyant being, delightful to talk with. Even tho his last dollar is invested in a profitless enterprise, he never loses his pluck. Sometimes he's up and sometimes down. He struck it rich at Portland, and if he loses at Jamestown he will "hike for Seattle." All are looking forward hopefully to the big days in the fall when the exposition is completed and the crops are laid by. They cheer themselves up with the example of Buffalo, which began with a spring frost and yet turned out very well in the end.

There is, however, one important difference. The late attendance depends greatly upon the reports of those who went earlier. The visitors to Buffalo were enthusiastic in its praise, particularly on account of the beauty of the electrical effects, while the returned Jamestown tourists have not been, as a rule, very efficient as advertising agents.

In so far as the poor attendance is due to bad management, I should say that the fault was in relying too much on the side shows and paying too little attention to the main tent. They should have taken warning from Omaha's disastrous second year. The exposition undeniably lacks substance. State buildings are, of course, very good things in their way. They afford excellent rendezvous for meeting long-lost relatives, and there are few things more grateful to the tired sightseer than a rocking chair on a cool porch of a homelike house after one has been seeing strange things and strangers all day, but a State building is a dull thing to tourists from other States. Once at an exposition, people are apt to spend

more time and money on the Midway or Warpath than they anticipated, but they do not go a thousand miles for the purpose of getting lost in a Mystic Maze or descending the Maelstrom of Hell Gate. Nor are the American people so fond of historic relics and mementos of the past as the Jamestown managers seem to think. They quite properly care more about the future than the past, and more about the present than either. The real lifeblood of an exposition is the stream of people who tramp unweariedly all day long thru the main buildings, up one

THE WARPATH.

aisle and down the next, always keeping to the right, so as to miss nothing, and collecting "literature hand-outs," to be read and studied during the winter evenings. This class of visitors, so conspicuous elsewhere, is not numerously represented at Jamestown.

I think too much stress has been laid on the unpreparedness of the exposition and high prices in accounting for the poor attendance. Packing boxes and building material lying about the grounds produce, of course, a bad impression, but people would be willing to overlook them and climb over them if there was something behind them that they wanted to see very much. There may have been attempts at extortion, but I saw no evidence of it. I had fifteen meals at almost as many different places in and about the exposition; some of them were good and some were poor, but in no case was the charge more than could reasonably be expected. On the whole, Norfolk treats the stranger more leniently than does New York.

Prices for board and lodging of all grades are about the same as they are in any large city or popular seaside resort. The great mass of exposition-goers want rooms at a dollar per person or less, and meals at not more than 50 cents, on the average, and they will be able to find them without difficulty. There are plenty of rooms to be had in the private houses of Norfolk, besides the hotels put up for the occasion outside the grounds. These big wooden hotels are, as a rule, to be avoided, because they are apt to be unsanitary and dangerous. A fire last

week destroyed in a few minutes several blocks of them at Pine Beach, just outside the grounds, and it was a miracle that the whole town of cheap pine lodging houses and amusement stands did not go and carry the exposition with it, for the water supply proved inadequate. But just as the flames were scorching the Negro Building and threatening the Inside Inn the wind changed and blew them back over the burned area.

The exposition is not situated at Jamestown Island, where the settlement it commemorates was made, nor at Norfolk, but is about seven miles away from that city. Communication is by two trolley lines and the fare is 10 cents by the more direct route. Two cars are run at intervals of five to fifteen minutes, and the trip takes forty or forty-five minutes if the power does not give out. The motor car and trailer together would accommodate about 150 persons, but they are never overcrowded and there is no jam at the gates. Even ladies can get seats, which seems strange to a New Yorker, accustomed to seeing the weaker sex stand during rush hours. Besides the trolley, steamboats run from the Norfolk docks to the exposition, making half a dozen trips a day. This is the pleasantest way of getting there, as the boats are comfortable and not crowded. The time by the water route is about an hour and the fare a quarter.

These means of transportation would be inadequate or break down entirely if the number of visitors should be as great as the exposition authorities anticipate, but so far they have not been heavily taxed. The largest attendance was on Georgia Day, June 10th, when President Roosevelt spoke from the steps of his mother's home, and it is said to have been about 40,000 or 50,000.

It is impossible to state exactly the average attendance because the officials refuse to give out the figures. My own estimate would be that the number of paid admissions during the last week in June was probably not over 5,000 a day, and was perhaps less than 3,000. I am not good at guessing, however, and the people would not stand still to be counted. The number of round-trip tickets validated during the first two months after the opening of the exposition is reported to be 37,000.

The people of Norfolk are naturally sensitive about the severe criticism of the exposition for which they have worked so hard and expended so much, and they are inclined to ascribe it to prejudice against the South and jealousy of the growing commercial interests of their city. They hope now to rally the Southern people to the support of the exposition, and so triumph over the "Northern knockers." How the Southerners will respond to this appeal to their loyalty cannot be foretold. South Carolina and Virginia have always stood by each other in the emergencies in the past, but the attendance on South Carolina Day, June 28th, was not large. I counted only 350 at the exercises in the Auditorium on that day, not including the militia and cadets, whose attendance was compulsory. No doubt many of the visiting Carolinians preferred seeing the exhibits rather than listening to the speeches of the two Governors.

But as I said in the beginning large crowds are one of the drawbacks to an exposition and it is only when we look at the fair from the standpoint of its promoters that we regret their absence. There is, after all, more at the Ter-Centennial than any one has time to see, and no exposition has been more attractively located. It is hot, of course, but not hotter than St. Louis was at this time. The nights are cool owing to the sea-breezes. There are too many flies but no mosquitoes. By filling in or flooding with salt water the swamps lying back of the city and watering places it is expected that the mosquito plague of the fall and the consequent malaria will be completely eliminated.

The sea is in itself enough to make Norfolk and its vicinity a pleasant place for a summer vacation. The best way to reach it is by water: either from New York, a thirty hour trip, or down the Potomac from Washington, twelve hours. The steamers in both cases are comfortable, but the traveler must take care to engage a stateroom at least a week in advance, otherwise he will be seriously delayed or discomforted. There are many side trips by land and water about Hampton Roads that will entice the tourist away from the exposition, but these I must postpone till next week.

New York City.

Steel Rails

BY JAMES C. BAYLES, M.E., Ph.D.

DURING the past few months public attention has been somewhat sharply focused on the subject of steel rails. Official statistics of breakage in service are extremely disquieting. The fact of the increasing risk of rail journeys is brought home to every person whose business or pleasure requires him to travel. To this he is naturally attracted by the steady progress in the direction of comfort; from it he is deterred by the knowledge that the conditions which make for comfort have subjected rails to strains and stresses which current experience shows they are not strong enough to bear. Until lately it was assumed that heavier engines and cars and higher speeds could be compensated for by making steel rails heavier in sections. Theoretically, this is plausible; in practice it is found that heavy rails are relatively more brittle than lighter ones. The largest percentage of current breakage is in rails weighing 100 pounds to the yard. The explanation of this would seem to be that as the 100 pound rails are rolled by the same machinery as the lighter rails, they are reduced to form with relatively less working than they would receive if lighter.

For the purposes of this discussion it is unnecessary to repeat the figures which have been given to the public in the published report of the New York State Board of Railroad Commissioners, and from other authoritative sources, showing totals of rail breakages which, however explained, point to the conclusion that steel rails as now made are not adapted to the service expected of them. A rail suited to the use to which it is put may wear out more or less rapidly, but it will not break. It has no other reason for breaking than that it is not strong enough. The questions of immediate public interest are:

Why are steel rails not made strong enough for the work they have to do?

Are the defects which impair their usefulness remediable?

What measures are desirable or possible for raising rail standards?

The reasons why steel rails are not made strong enough for the work expected of them are many and widely various. The fault lies partly with the railmakers and partly with the railroads. The conditions of the industry in relatively high protective duties and as the result of mergers and agreements which have practically eliminated inconvenient competition, have been such as to permit the railmakers to make every consideration subordinate to low cost and large output. Probably there has been no deliberate lowering of the standard of quality, but such a result is inevitable when nothing is permitted to stand in the way of tonnage. The mill manager who cannot make a record this month and beat it next month, is likely to lose prestige and find himself superseded by a more energetic superintendent. A representative American rail mill is a marvel to every visiting metallurgist and engineer. Its records confuse statistics and bewilder the imagination. Rail deterioration began when the temptation of unprecedented profits accelerated mill operations all along the line. The first step in that direction was the introduction of the reversing mill, which, by reducing the number of passes required to shape a billet into a finished rail, economized hot working and introduced in rails new phenomena of crystallization.

The exigent requirements of the railroads, calling for constantly increasing supplies of rails for extensions and relaying, has unquestionably led to some laxity in the selection of ores as low in phosphorus as the acid Bessemer process demands. Hence, in rail steel the phosphorus line has been permitted to rise higher than it should. It is doubtful, however, if this has been the cause of much trouble, if any. The railroads do not seem to think so. They have long prescribed the phosphorus limit in their rail specifications, also carbon, silicon and sulfur. Perhaps they would have

been more stringent on the subject of phosphorus if experience had not shown that more of this element than theory would approve had in certain notable cases of record been found in rails showing exceptional durability under severe traffic conditions. As a matter of fact, phosphorus is not and has never been the source of most trouble in steel rails. One of the most fruitful causes of irregularity in the working of the Bessemer converter, since the introduction of the mixer, which has given the greatest uniformity in the composition of the bath attainable in any metallurgical operation conducted on a large scale, is an original defect in the pneumatic process which appeared to defy correction until the introduction by James Gayley of his very simple and obvious device for desiccating air by refrigeration. This is about to be applied in the making of rail ingots, and is expected to raise their standards of density and general soundness by minimizing piping, blowholes and segregation. But neither an ideal analysis nor physical perfection in an ingot will insure a good rail if it is improperly heated or insufficiently or imperfectly rolled; if of such shape that serious internal strains are avoidable in cooling; if subsequently injured in straightening or punching; or if from any or all of several causes it is badly handled or unskilfully manipulated. There would seem to be no short cut to perfect rails.

But from the point of view of the railmaker it is not difficult to raise the standard of steel rails much above the present average, if they want to do it. Facilities for dealing with ores carrying more phosphorus than the acid reaction of the Bessemer process will safely tolerate, must be provided—and will be, forthwith. The better selection this would permit will result in keeping the phosphorus in acid Bessemer ingots at or below .08—the discards being reduced to pig suitable for openhearth or Bessemer basic treatment. The Gayley dry blast will minimize the one element of uncertainty in pneumatic conversion. A varying percentage of moisture in atmospheric air, often ranging in a single day from practical dryness to saturation, has rendered impossible anything like uniformity in the product of a reaction which is effected by blowing air thru a bath of molten metal. It means that the blower, who depends wholly upon his judgment, cannot make two heats alike unless by accident. When he can do this with certainty there is reason to believe that a large percentage of the physical defects in ingots will be avoided. If this is found to be the case, the whole problem will be simplified to the least expression. We shall then be better able than now to determine just what changes are needed in the shape of rails, how they should be rolled and at what point the increase of weight becomes an element of danger rather than of safety. These matters are now receiving careful consideration at the hands of the most highly qualified experts of the steel industry It is perfectly understood by them that they cannot afford to be indifferent to any just cause of complaint concerning their product. It would need very little to create a strong, popular demand for the withdrawal of tariff protection from an industry known to have found profit in meeting foreign competition in foreign markets, while professing inability to meet it at home. It is "good business" to do promptly all that can be done to rehabilitate the American steel rail in public confidence, and there is no reason to doubt that it will be done promptly and thoroly.

But there is another side to the question which should not be lost sight of. For such grounds of dissatisfaction with American steel rails as may now exist, the railroad engineers should take a much larger share of responsibility than they have thus far been willing to assume. The rails they have been getting for a good many years are the kind of rails they wanted. In every detail except behavior in use they have conformed strictly to specifications. To prepare these specifications the best men available have been employed at high salaries. Every operation at the mills has been watched, every detail examined and approved or rejected, and breaking tests have been applied as often as was thought necessary. The railmakers have shrugged their shoulders and said

in the vernacular: "It's up to you. If you want that kind of rails, they're the kind of rails you want." But experience is showing that they are not at all the kind of rails the railroads really wanted. For example, to increase wearing power and economize replacements, the railroads have gradually called for more and more carbon, until it will now average a little above 0.50 per cent. The rails resist wear somewhat better than they would if the carbon was lower, but they are more brittle and less able to resist the shocks which tend to fracture. On his own responsibility no rail maker would have had rails as high in carbon as those demanded by the railroad engineers, nor is it probable that such rails could be had in any other country. With 0.30 per cent. carbon rail breakages would be much less frequent than they now are. How this would affect the annual balance sheets of the railroads is a question the engineer does not feel called upon to discuss.

Meanwhile, increased axle loads, general train acceleration, and more especially the combination of these destructive conditions, in trains of unprecedented weight and inelasticity driven at the speeds developed in the competition of "fliers" under various attractive names, have increased the shocks and stresses to which rails are subjected in service in what may be described as geometrical ratio, while the railroad engineers have been able to meet them with heavier and stronger rails, better methods of fastening, axles and wheels immune to breakage, and other essentials of safety, only in what may be described as arithmetical ratio.

As was pointed out in these pages some months ago in a general discussion of train acceleration, the safety of heavy trains run at high speeds depends not upon any one thing, but upon perfect co-ordination in every item and detail of construction and equipment. It is a very serious question if, in the matter of railway speeds under present conditions, the limit of safety has not already been past. The statistics of rail breakage would seem to show this very clearly. In reply to an inquiry as to the experience of his road in the matter of broken rails, the executive head of an important system made the significant reply: "On our road we are having no trouble, because we have stopped at 45,000 pounds axle load and a moderate speed." It looks as if the solution of the whole problem of rail breakage was embodied in this modest statement.

From what precedes some idea may be had as to why the breakage of rails has so increased as to challenge attention, and to what extent rail defects may be attributed to causes quickly remediable. As to the measure desirable or possible for the raising of rail standards there is perhaps room for intelligent differences of opinion. Open competition between foreign and domestic rails would undoubtedly impart to the industry in this country a stimulus now lacking, and lead to the doing of all that could be done to hold the orders of American roads for American mills by the inducements of quality and price. At the moment, however, the question of tariff revision is rather academic than practical. The best results immediately in sight are likely to come thru an agreement between the railmakers and the railroad engineers as to formulæ, shape and physical properties. If this is not possible it looks as if the railmakers would be forced to adopt their own standard and to refuse any rail orders based on specifications not in conformity therewith. There is, however no present reason to believe that such an agreement is impossible or even difficult to be reached. The committee on rails of the American Society of Civil Engineers have approved and adopted the specifications formulated by the American Railway Engineering and Maintenance of Way Association and by the American Society for Testing Materials. An important item of this concurrent judgment, which is known to be in accordance with the views of the experts of the rail industry, has relation to changes in standard rail sections which increase the weight of metal in web and base relatively to head, thus insuring greater strength thruout, more equal cooling, and, by reason of greater uniformity of pressure in rolling, a denser head with a finer crystalline structure. The technical experts of the rail industry

are also studying the problem in their own way, and will undoubtedly soon reach definite conclusions as to the qualities essential in rails and as to the means by which these are to be secured. When the results are compared with those reached by the engineers who use rails, with a view to seeing how many points of agreement exist, the discussion of remaining points of difference will be much simplified. That any irreconcilable differences will be found is scarcely probable; but should there be, the casting vote, so to speak, will lie with the railmaker, and they should use it wisely, as well for the advantage of the railroads as for their own protection. Pending such agreement, the railway managers who have suffered from rail breakage would do well to limit their axle loads to 45,000 pounds and moderate their train speeds. To exceed the reasonable limit of safety in train acceleration to attract business is as grave a crime as to neglect necessary repairs and replacements.

New York City.

The Czar

BY SIMON REGININ

[The author of this article was for twelve years, till a few months ago, editor of the Russian department of an influential Vienna journal. He has published important interviews with all the leading Russian statesmen, and the facts here given are based on information furnished him by men in the highest positions in the Russian Court.—Editor.]

THERE is a popular legend in Russia about one of the ancestors of the Czar. According to this legend, the Czar entered a peasant's hut one day and saw an old woman praying and bowing to the ground.

"What are you praying for, old woman?" asked the Czar.

"I am praying for our Czar, our little father," replied the old woman.

"Do you really love the Czar so dearly, old woman?" he queried.

"It is not out of love that I pray for him. The servants of the Czar have taken everything away from me. They have spared only my life. A new Czar might take even my life away. I have survived three Czars, and the new Czar was always worse than the old one. I am therefore praying that there should not be a new Czar during my lifetime."

During the reign of Alexander III the old peasant women did not make such prayers; the personality of the young prince, Nicholas, was popular thruout Russia. The young Tsarevich was everywhere credited with love for truth and righteousness. The Russian people, who were cruelly tortured by the yoke of the police rule during the régime of Emperor Alexander III, had reason to hope for better days, for human treatment at the hands of the present Czar.

Together with the rumors to the effect that Alexander III ordered his successor to the throne on a long journey to Japan in order to cool off his passion for the ballet dancer Kshesinskaya, there were rumors of a more serious character. It was said that the Czar became angry at his son because he dared to prove to his father that he was indifferent to matters of importance to the Russian people. Indeed, Alexander III trusted his Ministers blindly, signing everything that was submitted to him for his signature, without acquainting himself with the contents of the documents signed. The Tsarevich was opposed to this blind faith. One day Nicholas placed among the documents prepared for the Czar's signature a paper ordering the whole family of the Czar to be banished to some remote place in Siberia. The Czar signed this paper, together with the other documents.

The popularity of the Tsarevich was manifested during the first days after his

ascension to the throne as Nicholas II. The people in the cities, as well as in the villages, felt really happy and their greetings of welcome to the young Czar were sincere. The houses and the streets were illuminated brightly, not by order of the authorities, as is usually the case, but of the people's own free will; and in many places, such as in Odessa, for instance, these manifestations of joy were checked by the authorities, who detected the influence of the revolutionaries in the love of the people for the young Czar. The former Prefect of Odessa, Lieutenant-General Zelyony, illustrated typically the bearing of the bureaucrats toward the new Czar. In the brilliant illumination of the city the Prefect saw a greeting to the "revolutionary" Czar, and, as a devoted servant of the régime of the knout, he became so enraged by the rumors that a new era would soon begin in Russia that he smashed with his cane the window panes in the house of the wealthy merchant Anatr, exclaiming: "Why are you rejoicing? You should rather cry. . . . A foolish boy will now rule Holy Russia. . . ." The crowd which witnessed this scene replied to the Prefect, shouting: "Long live Czar Nicholas!"

In Russia the Jews may always be taken as the barometer indicating the popularity of the Czar, for the slightest change in the administration affects the Jews first. And this oppressed nation expressed its love for the young Czar by offering prayers in all synagogs, imploring the Lord to prolong his life on the throne.

The progressive elements in St. Petersburg were beside themselves for joy. And the Czar, attired in the modest uniform of a colonel, was promenading along the Nevsky Prospect, politely acknowledging the greetings of the people who recognized him.

Liberal Russia began to breathe freely and began to take steps to pave its way to the Czar.

In the meantime the bureaucrats, knowing the Czar's weakness, his leanings toward justice, and fearing the consequences of a meeting with the real representatives of the people, began to plot against him, devising one attempt after another, and the Czar began to lead a secluded life. His strolls along the Nevsky were now replaced by his roamings in the Winter Palace.

His dream of coming into close contact with the people was shattered. Whatever the just enemies of the Czar may say about him, it should be added in justice to him, that Nicholas, because of his peculiar state of mind, is for some reason or other firmly convinced that all he does is done by the will of God and for the good of the people. Those that know the Czar, those that had an opportunity to study his mental make-up, believe that in matters of state Nicholas is never guided by considerations of a personal character. And yet no Czar, not even such a monster as Ivan the Terrible, was ever so hated by the people and by the bureaucrats as is Nicholas, who has forever ruined the prestige of the Czar in the eyes of the Russian people. The Russian nation has the peculiarly rare virtue of forgetting quickly its bitterest enemies and finding in them their good qualities. That is why the Russian people, especially the Russian Liberals, altho disillusioned in the new Czar, still spoke of him as of a good man who had fallen into the claws of the court clique which concealed from him the real state of affairs in Russia. But that was not true. Nicholas not only had the opportunity to know, but really knew everything that was going on in the land. However paradoxical it may sound, it is a fact that von Plehve did not conceal anything from the Czar. A high official, thru whose hands Plehve's reports to the Czar were passing, showed me a report in which he spoke of the peasant disorders; Plehve described the needs of the peasants, suggested to remove the landless peasants to Siberia, and as real police-chief, concluded his report with a recommendation to prosecute the rebels in the harshest manner. Opposite the place in the report saying that the life of the peasants should be improved, the Czar wrote "I have read it," and opposite the place where it was recommended to punish the rebels, the Czar wrote in large characters: "By all means." Besides, the Czar surrounded himself with people outside of the bureaucratic spheres, from whom he received secret reports about the condition

of affairs in Russia. Among these people were the meteorologist Damchinsky and the well known Bezobrazov.

I know that Damchinsky gave him a true picture of the course of events in Russia, and in one of his reports he suggested that the Czar invite certain public men and consult with them. The Czar said nothing in reply to that suggestion and then ceased consulting Damchinsky on any matter. The son of Count Leo Tolstoy told me that the Czar, in the course of a conversation with him, after the Gapon affair, showed a complete familiarity with everything occurring in Russia, but that notwithstanding all this. he did not rise above the viewpoint of an ordinary police-officer. Both Damchinsky and L. L. Tolstoy are convinced that the Czar looks upon himself as ordained by God, and, therefore, as the most just and wise man in Russia. But it is necessary to look into the mental make-up of the Russian monarch, to see why it is that his "high motives" always lead him against the people.

The Czar is very self-conceited and he imagines that he rules Russia independently. That is why the court clique, desiring to rid itself of this or that powerful man, spreads rumors in the foreign press to the effect that owing to the influence of that person upon the Czar, certain concessions were granted to the Russian people—which is quite enough for the Czar to estrange him. Count Witte was the victim of such an intrigue as this. The Czar began to hate him at the moment the foreign press began to speak of Witte as the man responsible for the new liberal era in Russia.

But this is not the case with those officials who are spoken of in the foreign press as being responsible for the cruelty of the existing régime. If not for Sazonov's bomb, von Plehve would in all probability have remained the Czar's favorite to this day, despite all the protests of the foreign press.

After the Kishineff massacre a deputation of respected Jews went to the Czar to ask him for protection in the future, but the Czar did not receive the deputation, referring it to von Plehve.

"What is it you wish from the Czar?" asked Plehve.

"We wish that the Czar should contribute at least one ruble for the benefit of the widows and the orphans of the ruined nation," replied the deputation.

"What's that for?"

"To show the Russian people that all faithful subjects are equal in the eyes of the Czar."

"Yes, that is true, that is very sensible, but I assure you that the Czar knows everything, and yet he will not grant your request."

The deputation thought that Plehve's answer was not the Czar's. But when one of the members of that deputation finally succeeded in reaching the Czar, by means of a bribe, he heard from the Czar exactly the same words that Plehve had said.

After the assassination of von Plehve, the Czar had a splendid opportunity to meet his people face to face. The people would have forgotten everything and would have forgiven the Czar, for, in the opinion of the people, Sazonov's bomb had killed the evil genius which hovered over the Czar. But what did the Czar do? Shocked by the loss of his favorite, he began to look about for a man who could avenge this assassination by repressive measures. But there was not a single man among the bureaucrats who wanted to assume such a rôle. Not that they were all too kind-hearted or that the interests of the land was so dear to them—they were simply afraid. Only cowardice kept the henchmen from becoming von Plehve's successors. These men were more affected by the assassination of von Plehve than the Czar was. In Sazonov's bomb they felt a serious call to account, and they were not yet ready to give this account. And the secret service men and the well-protected carriage seemed insignificant as compared with the terrible power of the bomb. After two months of fruitless efforts to find a successor to Plehve, the Czar turned to the then obscure Count Svyatopolk-Mirsky. The appointment of Mirsky was something like a reconciliation between revolutionary and bureaucratic Russia. The Czar had in view to ascertain the strength of the revolutionary forces and at the same time to give the bureaucracy, which had become confused, an opportunity to strengthen itself. But the appointment of Svya-

topolk-Mirsky proved a fatal blow to the Czar and his faithful servants. The artless, honest, straightforward Count understood his mission as a real patriot. To rule against the will of the people he considered a crime and the ruin of the country; and the first act of the new Minister was to break down the wall which separated the Czar from the people. The Count thought of bringing the Czar close to the people by introducing the freedom of the press, petitions and meetings, and thus afford the Czar an opportunity to make a personal acquaintance with the real state of affairs. The reaction of the Czar against this politics was best seen in the Gapon incident. He ordered to fire volleys after volleys upon innocent people who came to complain to him about certain functionaries. The supposition that the slaughter of the innocent people was against the will of the Czar is wrong. The originator of the Hague Peace Conference has always been of the opinion that the only way to speak to his own nation was by means of bullets. It is a fact that when General Meller-Zakomelsky reported to the Czar that he had succeeded in pacifying the province entrusted to him with kind words only, without resorting to military force, the Czar replied: "It's a pity you didn't shoot, General. You should have shot some of them."

The latest acts of the Czar are a series of wars against his own people. Cursing the moment when under the influence of Witte he signed the famous manifesto calling the first Duma, the Czar wants to force the people to refuse the promise he had given to them.

In the Russian court, as in all Eastern despotic governments, bigotry and sorcery have ever held a prominent place and have frequently served as the source whence all wisdom of governing the people is drawn. But there was hardly a single Russian Emperor during the nineteenth century who was as devoted to mysticism as Nicholas II. This well-bred monarch, who had spent a stormy youth, became a slave of the spiritualists and all sorts of "sages of the science of mysticism." It is true that Nicholas inherited, together with the throne, also the notorious Father John of Kronstadt. And this inheritance, in honor of his father's memory, led the young Czar to assign to myticism an important part in his domestic life as well as in matters of state. But if the Czar possessed at least an ordinary capacity to look upon life with critical eyes, he would have known the border line between savage, fanatical worship of magic powers and real life. Thus, in the terrible Khadinsy catastrophe, Father John of Kronstadt saw an evil omen which could be averted only by giving oneself up entirely to the power of God and his servants on earth; and the Czar, instead of punishing the functionaries who were responsible for the accident in which so many thousands of human lives were lost, followed the advice of the "prophet." Since that time Nicholas became a bigot. The greater part of the Emperor's day was spent in prayer. His leisure hours were devoted to the composition of church hymns and to seances of all sorts of professors of black and white magic. The French ex-cook, Philip, and Morgenstern, who had served his apprenticeship in a tailor's shop, introduced into the palace by some of the Czar's servants, ruled Russia for a long time, and also ruled the Czar himself. The court clique supported the prestige of these charlatans, knowing well the weakness of the Czar for all that is mysterious. Nothing could win the Czar over so completely as the fortune-telling of these charlatans, and they read his fortune, forecasting the future in accordance with the instructions given to them by the court clique.

The progressive elements in Russia were growing indignant, while the ignorant masses followed in the footsteps of the Czar. Spiritualists, mind-readers and magicians were in their glory; they never before lived so happily in Russia as they have during the reign of Nicholas II. But this passion for the mysterious almost cost Nicholas the throne. Father John of Kronstadt, displeased because he was compelled to share his power over the Czar with the spiritualists, began to plot to dethrone the Czar. The priest started to spread rumors among the people that Czar Nicholas was a scourge to Russia, that death was hovering over Russia since the day of his ascension to the throne, that God, granting six children to the Czar, did not grant

him a successor to the throne, because He regarded Nicholas as unworthy of the Russian people. The people who are now the "Black Hundreds" took up this agitation of Father John of Kronstadt. The people were seized with a spirit of discontent which threatened to develop into a rebellion on religious grounds. If the son had not been born Nicholas II would have been forced to abdicate in favor of his brother, Mikhail. Yanishev, the Czar's confessor, then persuaded the Czar to renounce the spiritualists and devote himself entirely to prayer. And to strengthen this religious fanaticism in the Czar, it was resolved to discover some new saint. Such a saint was soon discovered by the Holy Synod in the person of the old recluse Seraphim, who was buried in the forest of Sarov. The Czar and the Czarina went to pray at Seraphim's grave, and soon after the Czarina gave birth to a son. Is it strange after this that the Czar is guided in all serious matters by some mysterious elements and leads the nation astray?

During the recent war with Japan the Czar kept sending trainloads of ikons, instead of cannon and guns to the battlefield. The well-known strategist and military writer, General Dragomirov, said at one of the military conferences at the time: "The Czar is sending us ikons for the Japanese, while the Japanese are sending us bullets. He sends us some more ikons and they send us some more bullets. We will thus fight with prayers, and they with cannon, and, of course, we will come out victorious."

Such is the attitude of the more or less intelligent bureaucrats toward the Czar; but the majority of the court clique deride Nicholas, and frequently ignore him altogether.

What is the attitude of the revolutionaries toward the Czar? The Russian Emperor has demonstrated better than any of the revolutionary groups, or all of them taken together, how ruinous to Russia the autocracy has been, and thus the revolutionary party has found in the person of Nicholas II a valuable ally, and it is hardly in their interests to lose him.

New York City.

The Negro Doctor in the South

BY BOOKER T. WASHINGTON, LL.D.

Principal of Tuskegee Institute, Alabama

WHEN I went to Alabama in 1881, there was not a negro doctor, dentist or pharmacist in the State; three years later Doctor C. N. Dorsett located in Montgomery, Ala., and received a hearty reception from the white physicians and colored citizens generally. At the present time there are more than one hundred negro doctors, dentists and pharmacists in the State. In the district of Birmingham alone, there are over twenty-five. It might be well to mention here, that the first woman of any race, who was permitted to practice medicine in the State of Alabama, was a negro woman, Dr. Sadie Dillard, a daughter of Bishop Benjamin Tanner.

A few days ago the State Negro Medical, Dental and Pharmaceutical Association held its annual session in Birmingham, Ala. There were present seventy-one men and women connected with the medical profession. Aside from those who reside in the State there were present medical men of national reputation such as Dr. Geo. C. Hall, of Chicago; Dr. A. M. Curtis, of Washington, D. C., and Doctors Boyd, Stewart and Roman, of Nashville, Tenn.

The progress that I have mentioned as having taken place in the State of Alabama is a fair sample of what is going on thruout the South. One does not hear much of the negro doctor, but there are few stronger forces at work, in the elevation of the race, than those represented by the negro doctors. The negro physician is well treated by the white physician. In many instances the white doc-

tor is willing to lend the negro doctor books, instruments and, with few exceptions, is glad to go into the consultation room with him. He receives practically the same consideration at the drug stores that is accorded the white physician. In almost every section of the South, where I have gone, I have observed that the negro doctor is not only treated with high respect by the colored people, but

THE ALABAMA MEDICAL, DENTAL AND PHARMACEUTICAL ASSOCIATION, BIRMINGHAM, ALABAMA.

equally so by the white people. There are comparatively few cases where the negro doctor has not held his own from a moral point of view. The number who have gone down on account of drink or other bad habits is very small.

The influence of the negro doctor, in the elevation of the race, has extended further than the mere practice of medicine. In many cases it will be found that he is a successful business man in the community in which he lives, and owning valuable property. In Montgomery, Ala., for instance, the negro doctors own and operate four drug stores; in Birmingham and Mobile they own and control equally as many drug stores.

One of the largest and most successful wholesale drug stores in the city of Anniston, Ala., is owned by Dr. Charles I. Thomas, and there is nothing in its appearance, outside or inside, that indicates it is not in the hands of a white man. Nearly every town or city of any size in Alabama has its negro drug store, and its patrons are not confined to the negro race, altho the practice of the negro doctor is confined almost exclusively to the members of his own race.

The influence of the negro doctor has gone still further: In nearly every large city in the State there are hospitals or in-

firmaries, where good surgical and medical attention is provided and nurses are trained. In some instances the institution is owned and controlled by the public, in other instances they are owned by individual doctors.

The majority of the negro doctors, dentists and pharmacists in the South have been educated at Howard University, Washington, D. C.; Meharry Medical College, at Nashville, Tenn., or at the Leonard Medical College, at Raleigh, N. C. At the Leonard Medical College, from the beginning, a majority of the professors have been Southern white men residing in Raleigh.

Last April I had the pleasure of delivering the commencement address to the graduating class of the Meharry Medical College when ninety-six received diplomas in medicine, dentistry and pharmacy. A majority of these, of course, will practice in the South.

The evolution of the negro doctor has been a gradual but constant one, and his influence for good will be felt in an increasingly strong manner thruout the South each year.

TUSKEGEE, ALA.

The Story of a Houseworker

BY C. S. ANGSTMAN

MY maid was very taciturn, but evidently quite a superior girl, so I was interested to find out why she was doing housework, and led her on talk of herself at two or three different times, and this is what she told me:

"You see, we girls had a stepmother, and she soon had children of her own, for whom perhaps it was natural that she should want all that there was, but, anyway, we were always short of clothes and the many things which girls are always needing. We continued to go to school, however, till my father died, after which the family was soon separated. At this time I was thru the second year of high school and sixteen years old. Having now to take care of ourselves my sister and I turned naturally to housework, because we had been well trained in that at home and because we could always get it without much trouble, tho after a number of years I have come to see that it is almost as hard for a girl to get a satisfactory place in which to work as it is for a lady to get a satisfactory helper.

"After working in our home city for a while, we went to the large city of ———. Soon after our arrival, I secured a place in a knitting factory, lured on by the stories of evenings and Sundays to one's self and big wages, told by the girls at our boarding-place, who thought housework quite beneath them. Work in the factory was paid by the piece, so the faster we worked the more we earned. Being naturally quick motioned, by much hurrying I soon made $12 a week. But, oh, the noise of the machines! They seemed to be going all night long, and I was always hurrying, hurrying with everything, even in my dreams. It seemed that as I outdistanced many girls in the number of socks which I could finish in a day, and so made more money than they did, that a perfect fever took possession of me to accomplish always more.

The room in which two hundred of us girls worked the machines was low, long and narrow and dark, lighted from small windows at the front and back only. These windows were not opened all winter long, and as there was no system of ventilation you can imagine what the atmosphere was. We hardly realized that there was a sun or even daylight. All winter long we went to work in the dark and went home in the dark. Seeing occasionally a little more brightness thru the dingy windows than at other times, we could only guess that the sun might be out.

"After a year of this life, I gave out

utterly and was just a shadow of my former self. I had never been especially nervous before, but now I went at everything with that feverish hurry which had made me able to earn so much in the factory.

"After an enforced rest, during which I was obliged to make quite an inroad upon my savings, I began to look about for other work to do, for I realized that I could never go back to the factory. It always seems to the 'hired girl' or factory girl, that if she can become a clerk she will have reached a very high goal, so after considerable managing I finally secured a place in a leading dry goods store at $4 per week. I secured room and board at one of the best places, so called, in the city for girls who are alone, a boarding-house run by the Y. W. C. A. for $3 a week. It was the cheapest respectable place which I could find, and my tiny room was shared with another girl. I thought that I could manage my other expenses on $1 a week or the gradual increase to which I looked forward hopefully, until such time as I should become manager of some department at $10 or $20 a week, or perhaps marry one of the proprietors, as a saleslady in one of the large stores had lately done. I was placed at the notion counter, where there is usually a brisk trade, so plenty of girls, and early in the morning, while customers were few, there was plenty of gossip. I soon found out that a good many girls had been working a long time without any increase of pay; that those who stayed at $4 a week were mainly of two classes: First, those who had homes where the parents were satisfied if the daughter gave her mother $1 a week for pin money from her wages, or now and then a $5 bill and gave them no trouble about clothes and other expenses; second, those who had no homes, but had "friends." Some of these latter had so lost all sense of propriety that they would talk quite freely of their companions to the rest of us in the intervals of work, especially as they were usually connected with the business in some way. I had had enough moral training at home, perhaps coupled with a strong moral nature, to make me determined never to be forced into any such path as that. Finding that my little store of savings was nearly gone, and that forty cents a week left after paying board and carfare, did not go very far toward clothes, which had to be of a better quality than for factory or housework, I went to the general manager and I told him I must get more wages, that I could not live on $4 a week, that my living expenses left me nothing for clothing. He knew that I had no relatives to aid me, and yet he asked me if I could not get some one to dress me. He also said that the store next door paid none of their clerks more than $3 a week, which I knew; also that I was getting more now than quite a number of other girls in the store who had been there longer than I had. This was just after Christmas, and we had been working every night for two weeks till ten o'clock without extra pay, so some of us had been quite hopeful of a raise. We found, however, that the late working hours, which meant a chance to sleep from eleven or twelve at night till six in the morning only, were the price which we paid for holding our positions.

"Seeing that I couldn't continue to live as I had, I next tried sewing, having had considerable experience at home. I only continued that for a few weeks, as it was most distasteful. It was always a great strain, because so much work had to be done over and so there seemed to be so little to show for a great many hours' work. Also there was always some pressure brought to bear for working overtime—garments to be finished in time for a wedding, a party, a trip, or something. I soon foresaw a condition for myself if I continued the work, such as nearly every one I knew had fallen into, if she had sewed for any length of time—nervous prostration, or a condition bordering very closely upon it.

"I boarded during all this time at a number of different places, but it was about the same story at them all. There was seldom food which I could relish and hardly ever enough of it. To save carfare, I never went home to lunch, and as I had to pay the same per week with or without a lunch, I generally took one with me. As it was unvaryingly a slice of bread and a ginger snap, I often turned from it in loathing, eating nothing from breakfast till dinner at seven

o'clock. After such a fast I had little wish for the lone, soggy potato and slice of poorly cooked meat, with one ill-seasoned vegetable, followed by a piece of poor pie, which was our unvarying ration. A little attractive pudding or fruit would have tempted my appetite sometimes, but there was always that dreadful pie. These were also the conditions at the Y. W. C. A. boarding place, where I stayed a year. You see cooks are so scarce that our housekeeper stood in mortal fear of our cook, not giving her many directions for fear of stirring up that bad temper of hers and making her leave, so we girls took the consequences. I don't see how those Y. W. C. A. people can expect us to take much interest in the singing and preaching they often do at the boarding-house when we can't help thinking of our stomachs and are longing for a good square meal.

"I didn't realize for a long time that the food had so much to do with my going down physically, but finally I did. After more than two years in the factory and store and sewing room, I had lost thirty pounds, had a persistent severe stomach trouble and was almost a nervous wreck. All this was in contrast to the perfect health which I had when I came to the city. Thinking rest would make me all right in a little while, I remained quietly at my boarding place for several weeks, meantime doing a lot of thinking. As I am twenty-four years old my 'lost opportunities' quite naturally came to my mind, as well as the possibilities of marriage with any of the men of my present acquaintance. I was, however, satisfied with the decision which I had made several times before—that I had never yet become acquainted with any man in whose hands I dared to place my future, especially when I remembered the experience of some of my friends in the matrimonial line. As I continued to think, I remembered that in any occupation outside of housework I had to share my room, for economy's sake, with some other girl, altho we had separate beds. During the year that I was at the Y. W. C. A. boarding place, I had shared my room with as many as twenty different girls, most of them persons whom I would never have chosen for friends or companions. To be obliged to listen to their conversation, which was often anything but refined or elevating, and to be constantly annoyed by their disorderly and untidy, even unclean habits, was most obnoxious to me. I reflected that in almost every place which I had ever worked at housework I had had plenty of good food, well cooked; that I had always been well while doing housework, my ills having come upon me in other occupations. I reflected that the free Sundays, which had been such a strong force in holding me to other occupations, were really not free at all and seldom used for either pleasure or profit. Indeed Sunday was the only time when I could do my room work and mending or any little necessary sewing. In many places where I had done housework, I had been able to do such things afternoons, which I usually had to myself, for I had always been quick-motioned and a good planner, realizing the value of minutes, and thus my work was usually done with the luncheon dishes, till time to get dinner. I reflected that I did not have to buy any but inexpensive clothes for doing housework, or spend any carfare going to and from my work; that I was considered a competent girl, so could always get at least $4 a week, without washing, and by going out of the city in the summer, $5; that I have to pay nothing for board or room; that my health is always at its best doing housework for an occupation, which means plenty of exercise with opportunity to rest afternoons, and which has always kept me in the best condition; also that the little nest-egg upon which I had drawn when worn out or in need of more funds than in other occupations had always been accumulated doing housework. To sum up, I have more time, money, health, privacy and choice of companions doing housework than anything else. Why don't I do it? Well, my social position is not as good in this occupation as in others. People will call me 'kitchen mechanic,' 'pot slinger,' 'hired girl,' and maybe even wonder if I am respectable. However, I remembered that some of my good mistresses had told me if more nice girls would do housework, it would soon elevate the social standing of the whole class, and that it wasn't what a girl did, but what she was, that counted.

and so I determined to swallow my pride and look for a position at general housework—general, because then I could have a room to myself and need have no associates not of my own choosing.

"I soon found a position in an excellent family of four and was very happy there, beginning my day's work at seven, and finishing about seven in the evening, with about two hours' rest in the afternoon. One afternoon in the week I was allowed to go out and remain till bedtime. I also had this privilege on Sundays, my work being finished then also at about half past two. I was always furnished with good reading, Madame remarking that she wished that she could get anything near as much time to read herself. In a few weeks I had read several of Seton-Thompson's books, Alice M. Bacon's 'Japanese Women and Girls,' 'Titus,' besides some good novels, magazines and the newspapers. I had a warm, neatly-furnished room to myself and courteous treatment. I might be there yet, but summer came, this family moved out of town and I went to one of the resorts, as I had done before, at $5 a week for three months, but I took care to find out beforehand what the quarters for the help were, that I might not repeat a former experience. That time the girls all slept in one big room in an ill-odored, damp basement, and the men help straggled thru at all hours, having no other passageway to their own similar apartments.

"I tell you, girls who work for a living are almost powerless against the forces on every hand calculated to break down their health and morals. However, general housework is the best of all for any girl of sufficient muscle, and who knows and keeps her place."

With such invincible arguments set forth in such a convincing manner by my houseworker, I began to feel some of that old-time security when one had the same helper for years, or at least felt that if I didn't keep her, there was one jewel in the profession for some distressed lady at least. One morning, however, I was taken aback by the announcement that she should leave when her week was up. In consternation I asked why, and she confessed that she couldn't stand the social pressure; that James, a new friend, looked down on girls who did housework, just as others had done, and that only last evening when he took her and her clerk friend, Lucy, to a restaurant she had to kick Lucy under the table to make her keep still when he was sneering about "kitchen mechanics." She expected to get a place in a store again, but this time a better one, and so I was rudely awakened from my dream of security.

DETROIT, MICH.

O Southland!

BY JAMES W. JOHNSON

O SOUTHLAND! O Southland!
Have you not heard the call,
The trumpet blown, the word made known
To the nations, one and all?
The watchword, the hope-word,
Salvation's present plan?
A gospel new, for all—for you:
Man shall be saved by man.

O Southland! O Southland!
Do you not hear today
The mighty beat of onward feet,
And know you not their way?
'Tis forward, 'tis upward,
On to the fair white arch
Of Freedom's dome, and there is room
For each man who would march.

O Southland, fair Southland!
Then why do you still cling
To an idle age and a musty page,
To a dead and useless thing?
'Tis springtime! 'Tis work-time!
The world is young again!
And God's above, and God is love,
And men are only men.

O Southland!, my Southland!
O birthland! do not shirk
The toilsome task, nor respite ask,
But gird you for the work.
Remember, remember
That weakness stalks in pride;
That he is strong who helps along
The faint one at his side.

NEW YORK CITY.

Literature

Euphues and His America

No book which Mr. Henry James has written makes so severe a tax on the loyalty of even his most enthusiastic readers as his *American Scene.**

The volume purports to be a collection of impressions gathered during a sojourn of ten months or thereabouts, which, after an absence of five and twenty years, Mr. James last year made in the land of his nativity. In the preface we are told that "there are features of the human scene, there are properties of the social air, that the newspapers, reports, surveys and blue books would seem to confess themselves powerless to "handle," and we are led to expect a study of the "manners, habits, intercourse, relations, pleasures, etc.," of the American people by one who "made no scruple of his conviction that he should understand and should care better and more than the most earnest of visitors, and yet that he should vibrate with more curiosity than the pilgrim with the longest list of questions, the sharpest appetite for explanations and the largest exposure to mistakes."

But it is exactly these promises which the volume most signally fails to fulfill. *The American Scene,* one feels safe in saying, will never be taken seriously by students of "manners." Its strongest, indeed its almost exclusive, appeal will be to the admirers of that curious and highly ornate species of rhetoric which it has been Mr. James's special vocation to develop.

In reading *The American Scene* one is reminded at every page of the quaint note on John Lily written in manuscript by William Oldys upon the margin of his copy of Gerald Langbaine's "Account of the English Dramatick Poets." He writes:

"Lillye was a man of great reading, good memory, ready faculty of application and uncommon eloquence, but he ran into a vast excess of allusion; in sentence and conformity of style he seldom speaks directly to the purpose; but is continually carried away by one odd allusion or simile or other (out of natural history—that is yet fabulous and not true in nature) and that still overborne by more, thick upon the back of one another, and through an eternal affectation of sententiousness keeps to such a formal measure of his periods as soon grows tiresome, and so by confining himself to shape his sentence so frequently into one artificial cadence, however ingenious or harmonious, abridges that variety which the style should be admired for."

With the substitution of "America" for "nature" in the parenthesis, we doubt whether Mr. James's book could be more justly or adequately reviewed than by the application to it of this passage from Oldys. Like Lily's "Anatomy of Wit" and his "Euphues and his England," *The American Scene* is not so much a monument to truth or history as to the pale-cheeked goddess of rhetoric.

We confess our hesitancy to pass adverse judgment upon the work of a man who is in so many respects a superlative master of his art. And yet, as we have already observed, the present volume makes an excessive demand even upon the most ardent enthusiasm. Let the following description of the body and soul of New York bear witness to the justice of this assertion.

Mr. James is advancing upon the city from the western shore of the Hudson. "You see the pin-cushion in profile, so to speak," he writes, "on passing between Jersey City and Twenty-third street, but you get it broadside on, this loose nosegay of architectural flowers, if you skirt the Battery, well out, and embrace the whole plantation." This is his description of the body of New York.

Nearing the city he discovers that this "pin-cushion," which when we get it "broadside on," is a "nosegay of architectural flowers," and which presently, by a curious process of legerdemain, becomes a "whole plantation," possesses a soul, which as a

"universal applied passion shines unprecedentedly out of the composition; in the bigness and bravery and insolence, especially, of everything that rushes and shrieks; in the air as of a great, intricate, frenzied dance, half merry, half desperate, or at least half defiant, performed on the huge watery floor. This appearance of the bold lacing together, across the waters, of the scattered members of the monstrous organism—lacing as by the ceaseless play of an enormous system of steam shuttles or electric bobbins (I scarce know

*The American Scene. *By Henry James.* Harper & Brothers. $3.00.

what to call them), commensurate in form with their infinite work—does perhaps more than anything else to give the pitch of the vision of energy. One has the sense that the monster grows and grows, flinging abroad its loose limbs even as some unmannered young giant at his 'larks'; and that the binding stitches must forever fly further and faster and draw harder; the future complexity of the web, all under the sky and over the sea, becoming thus that of some colossal set of clock-works, some steel-souled machine-room of brandished arms and hammering fists and opening and closing jaws."

Clearly, to take this passage seriously as a document in the study of manners, would be to show an absurdly defective sense of humor. How shall one account for this nightmare confusion of imagery unless one remembers that Mr. James is concerned not so much with truth, as with rhetorical *tours de force,* and that, like the pious juggler in the old fable, he delights in spreading his mat before the altar of the goddess of his worship and in forgetting all the world in his zeal to do her reverence?

There are, to be sure, some passages in *The American Scene* in which Mr. James's enthusiasm for the pale goddess of rhetoric sufficiently abates to permit him to write the language of ordinary human intercourse. These are passages in which the objects of his description—a collection of impressionistic paintings which he chanced upon in the Massachusetts hills, St. Gaudens's statue of Lincoln, in Chicago, the Old South Church in Boston—sufficiently interest him to absorb his attention. But these objects are rarely characteristic of contemporary America. With the America of today he is entirely out of sympathy. He has a high contempt for what he calls the "American gregarious ideal," and as an analyst of American civilization, he is unable to make any less hackneyed discovery than that we are inspired by a "perpetual passionate pecuniary purpose."

Three English Novels

But few of the English novelists of a new generation succeed in gaining an American hearing, we are so well supplied with authors of our own nowadays. American publication of an English novel has become a distinction, a guarantee almost of at least first-rate workmanship, a reward of the taking of infinite literary pains, which, truth to tell, is more practiced across the ocean than in this country of quick sales and brief popularities. Such work as that in "The Divine Fire," for instance, is rare with us, a leisurely, loving, time-consuming polishing and finishing that testifies as much to an indifference toward commercialism as to a love of art for its own sake, and for that of the pleasure it brings. This literary quality is found in the work of Mr. John Galsworthy in increasing measure in each of his succeeding books. *The Country House,*[1] his latest, is a better novel, better constructed and better written, than either "The Island Pharisees" or "The Man of Property," its plot especially, while still apparently slight, being in reality of much firmer and closer texture. The "county family" has been an unending source of material for the major and the minor British novelist, a subject capable of many changes, and even of repetitions that yet have not palled, its qualities are so gracious, so attractive so full of aristocratic distinction, which may be laid on with a trowel by the writer for suburbia, or deftly, appreciatively, even reverently handled by a Mrs. Ward, or, to revert to an older day, by a Trollope, who, by the way, was far from blind to its narrowness.

Apparently the squire, his family and his entailed estate, have had their day in English fiction. The hand of the radical novelist is robbing them of their graces and privileges to expose the uselessness and provincialism, the reactionary force they cover. Mr. Galsworthy does justice to the beauty of the external life and circumstance of a class favored by a social system, but merely to make the contrast more striking. From father to son the Pendyces have lived at Worsted Skeynes, dignified, honorable, upright, narrow-minded and useless. The head of the house believes that this order of things is to be continued forever, that it is a law of nature, nay, more, a command of the Deity. But his oldest son and heir falls in love with a woman who lives separated from her husband, and—well, the scan-

[1] The Country House. *By John Galsworthy.* New York: G. P. Putnam's Sons. $1.50.

dal necessitates their marriage if the woman can secure a divorce. That is all the plot there is, but it suffices, because every figure in the situation is a carefully developed character study, the women being no less understandingly presented and differentiated than the men. Mrs. Pendyce especially, while standing as the type of the aimless, unsatisfying sheltered life of her class, remains an individual with a pathetically strong appeal to the reader's sympathies.

Of the older order of this class of fiction, *Sir Elyot of the Woods* does not question the privileges of England's landed gentry; rather does it hold them up for admiration, and invite us to feel again deeply for the familiar young heir to an estate heavily loaded with mortgages, a burden to him, not a possession. How many times has the young Englishman thus handicapped stood before us in the pages of British fiction? It were hard to say, yet this latest of their numbers does not bore us, even tho we have known his many predecessors so well. It is the penniless girl whom he would make his wife, against all counsel of worldly prudence, who gives the tale its fillip of novelty. She is an enigmatic creature, but unfortunately she is suggested, not realized, by the author, who invites the reader to do a good deal of the work he should have done. For this reason the book escapes being what it might have been, a notable piece of work; as written it is nothing but a fairly readable "minor novel."

John Glynn[3] is a strange combination of ready emotionalism—the emotionalism of the lower classes, so easily appealed to, so readily responsive, so short-lived—and the strenuous methods of the strong hand. A tale of settlement work in a London slum, it glories in the fistic prowess wherewith John Glynn saves the weak and discomfits the wicked. There are few difficulties in the problem of the salvation of the submerged that the settlement workers in this story do not tackle with complete confidence and much success. Withal, it is a lively story of the villain who pursues—of a modern Fagin and his slaves—and of the hero who gives battle and triumphs, whatever the odds. And the author certainly knows, understands and loves the poor of whom he writes.

[3]John Glynn. *By Arthur Patterson.* Henry Holt & Co. $1.50.

The New England Theology*

It is not at all a matter for dispute that New England has produced as glorious a company of theologians as have sprung from any soil in the last two centuries. From Jonathan Edwards in the early half of the eighteenth century to Edwards A. Park in the later decades of the nineteenth, a succession of gifted and brilliant men, in a comparatively small section of New England, busied themselve with high themes of God and man to such good purpose that the great recurring questions of religion stand out in their writings illuminated by the insights of masters. One pursues the large problems of theology in the light of most searching thought, not only when reading Jonathan Edwards, but scarcely to a less degree when following the arguments of Hopkins, Emmons, Taylor and Bushnell. With few exceptions the theologians of New England were skilled in philosophy and logic, and without exception they were close to the people and considered theological questions in relation to practical life. As theologians they worked out the problems which the Churches met in endeavoring to preserve the inheritance of the Puritans and to extend the Puritan spirit and ideals over a continent. The debates they carried on were on the most important subjects that can arise in connection with Christian truth.

It would seem, then, as if there were every reason why theological students, particularly Americans, should be familiar with the writings of the New England school of theologians and know the history of the movement. Yet it is the exception rather than the rule to find one who has more than a hearsay knowledge of any of these religious leaders, unless it be Jonathan Edwards, and it is doubtful if many of our younger clergymen would care to take an examination in Edwards on the Will. Students in our

*A Genetic History of the New England Theology. *By Frank Hugh Foster.* Chicago: The University of Chicago Press. $2.00.

seminaries are sent to Schleiermacher's "Reden über die Religion" instead of to Edwards's "Treatise on the Religious Affections," where in fact they would find very much the same doctrine, couched in very much the same eloquence, but with an American application.

Professor Foster has performed a patriotic service in preparing a clear, readable history, based on the sources, of the course of religious thought in New England. He has sought to produce a genetic history, to show the influence of mind upon mind and to trace the current of the thought, and he has achieved a notable success. His analysis of the contributions of the several leaders of the movement is keen, his judgments are fair, and his grasp of the stream of thought as a whole and in its relation to the life of the nation is clearly evident. We venture the sincere hope that this able monograph will serve to promote wider knowledge of our own American contribution to the search for divine truth. Full bibliographical references make the book useful as a manual for further study in its subject.

English Colonies in America

Bred in the traditions of the great Liberal London morning newspaper, *The Chronicle*, the accomplished Fellow of All Souls' College, Oxford, Mr. J. A. Doyle, in Volumes IV and V of his great work on the *English Colonies in America** presents the history of the Middle Colonies and of the colonies under the House of Hanover. The author complains of a lack of proper documentary authority concerning New York. Yet he reveals the defect of his own and of much historical writing of today. In the United States this work has fallen largely into the hands of men who make history very much out of papers and very little out of life. In the first place, Mr. Doyle speaks thruout of New Netherlands, which is about as accurate as to say, as almost all Englishmen do, *Van* Tromp. In the Dutch mind, Netherland*s* meant the old seventeen provinces, including what is now Belgium, as well as the Northern United Provinces. One could never imagine the statesmen of the triumphant Dutch Republic of 1609 giving to the land of Hudson's discovery a plural name savoring of "back numbers," medievalism and Spanish dominion; but it was "the Union forever" to apply the term belonging to their own united Fatherland to the Dutch invasion of the American continent, which the King of Spain called his private property. Hence *Nieuwe Nederland,* singular.

In his detailed account of the Dutch colony, the conquest of 1664 and reconquest of 1674, and of New York under Andros and Dongan, Mr. Doyle does slight justice to the full facts. He does not explain the reason why this colony led all in the development of what we now recognize as American constitutional law. The composite people of New York gathered from many nations, and instinct with the principles of the free republic of Holland, which had for its basis Roman and not British law, having no royal charter, were led by the lawyers rather than the clergy. As a body of un-English freemen they studied critically the foundations of government and jurisprudence. Necessity was the mother of invention. Mr. Doyle follows the traditional, but incorrect, notion that the politics of the Middle Colonies were mostly of a petty and personal nature. As a matter of fact, the royal governors sent over were mostly land speculators and men of graft, and had to be resisted both in their claims of prerogative and in their determination to fill quickly their pockets. Gradually on an immutable basis of law and rights, New York, probably the most typically American of the colonies, grew up, founding its precedents less in a monarchy than in a republic, being less a New England, or a New Holland, than a new and better Europe.

Mr. Doyle ignores two significant lines of history. One is the long struggle, by the Dutch churches having royal charters, against the attempt of the Crown's agents to set up the Established Church of England in the colony, by grafting it on the Reformed Dutch Church. He also ignores the fact that the very large Dutch population remaining on the soil

* English Colonies in America. Vols. IV. and V. *By J. A. Doyle, M. A.* New York: Henry Holt & Co. $3.50 each.

after the English conquest, while retaining their language and republican ideas, had virtually no further communications with Holland, and, caring little about England, which they knew about chiefly thru treacherous naval wars, oppressive navigation acts (directed against the country of their fathers, but which brought on the American Revolution), developed early the continental, instead of the colonial, habit of mind. Their American ideas made them universally patriots during the Revolution, despite the loyal aristocratic families on Manhattan Island.

With these limitations, it must be gratefully confessed that in grappling with the subjects so complex as the foundation and development of New Jersey and Pennsylvania, Mr. Doyle presents a story of clearness and unity, tho it lacks that close and vital knowledge which might give firmness of touch and vividness of local coloring. In Volume V, however, we recognize a work as unique as it is valuable, for a one-volume history of the colonies under the House of Hanover has, we believe, no mate. Mr. Doyle has certainly read long and wisely in the town and State documents. He treats of economic and social life in a satisfactory way, and dwells on the theme of religion with catholic tastes and outlook. In setting forth literary and intellectual developments, he has Moses Coit Tyler's superb treasury of facts to draw from. The colonists and the inferior races are dealt with, on the whole, with grasp and fairness, as is also the ethnology of the colonies, while the colonization of Georgia is very fully treated. Into his narrative of the Conquest of Canada and the activities of Washington, Mr. Doyle throws considerable vivacity. There is, of course, a good index to each volume.

On the whole, we regard this work as a triumph of patience and industry. It is a praiseworthy attempt to set forth the story of the rise to national consciousness of what the author calls the English Colonies in America, tho it is probable that of all who crossed the sea to settle, not one-half were English people, the majority being from the other three nations of Great Britain and from Continental Europe. The narrative reveals very clearly the English statesmen's habit of ignoring changes which lie below the surface and of heeding only those warnings which arise from outward phenomena.

The Quest. By Frederik van Eeden. Translated from the Dutch by L. W. C. Boston: John W. Luce & Co. $1.50.

The Quest offers a fresh and forcible illustration of the danger of providing sequels to a successful work. In 1885 Dr. Frederik van Eeden published a tiny volume entitled "De Kleine Johannes," which is said to be the most popular book which has appeared in Holland during the last fifty years. Better still, "De Kleine Johannes" really came very near being a masterpiece in its way. It was philosophic as to substance and lyric prose as to form; as profound as the most thoughtful adult could desire and yet simple and sweet enough—barring a few phenomenally gruesome passages—for a child. Under the guise of a fairy tale it depicted the influence upon the soul of man of beauty, knowledge and goodness, and established the supremacy of the last named. It ended with a genuinely impressive climax. It was charming, complete, symmetrical, and, artistically speaking, convincing. Some years later, Dr. van Eeden published a sequel to "De Kleine Johannes," entitled "Johannes Viator," in which he resorted to the device, then much employed in the painting and literature of the Continent, of putting the Christ into a modern environment. "Johannes Viator" was as inferior, considered as a whole, to "De Kleine Johannes" as Milton's "Paradise Regained" was inferior to his "Paradise Lost." It lacked the charm, the simplicity and the symmetry of the earlier volume and added nothing substantial to its thought. Nevertheless, it included two rather effective characters (Aunt Seréna, a pious Dutch Protestant type, and Marjon, a circus girl), a captivating picture of the realm of Pan, and a masterly portrayal of the mourning of Nature for the death of Pan—features which sufficed, perhaps, to justify it. Finally, in 1906, Dr. van Eeden supplied a sequel to this sequel. It confused, instead of driving home, the thought of the two preceding volumes, and possessed so

few redeeming qualities that its excuse for existence is not easy to discern. It is these three works, bound together into a single thick volume (rather awkward to handle, by the way), which is now offered us, in an English translation, as *The Quest*. *The Quest*, as a romance, is, by reason of its loose construction and its generally feeble character drawing, a negligible quantity. As a work of philosophy it is suggestive, but tautological and obscure. As a social study, on the other hand, it possesses exceptional value; is, in fact, one of the most comprehensive arraignments of the hypocrisy and corruption of the age that has yet been written. Obviously and even ostentatiously a book with a constructive purpose, its destructive portions are so much more clever and convincing than its constructive portions (mostly sermons) that the latter are completely overshadowed —the common lot, if we mistake not, of the muck-raking novel with a mission.

The Windfall. By Charles Egbert Craddock. New York: Duffield Co. $1.50.

Even a successful novelist is a poor badgered soul. He cannot continue to lay the scenes of his stories where he knows the ground and where for that reason he first won success. The reader, who may never have gone beyond his native village in real life, is nearly always an indefatigable tourist in fiction. He wants love in a new neighborhood and tragedy imported, like foreign wine. This is why Miss Murfree was obliged to abandon her Great Smoky Mountains some years ago. The stories she wrote of that region were fresh and vigorous, but presently her readers wearied of the scenery. They were willing to keep the mountaineers, but not the mountains. And one of the few reputable literary critics that the South has produced complains at length of the persistence of her crag-ragged sky line, of the regularity with which the moon invariably arose, just after sunset in the second chapter, and even of the monotony of the whip-o-will's cry—as if Miss Murfree could be held responsible for the fact that nature in compiling the Great Smokies never intended that they should be changed to please the stage fancy of novel readers. But if she could not vary the magnificence of her mountains, she could at least abandon them, and so for the past few years she has written historical romances, remarkable for their charm and literary flavor—only to meet with further ingratitude from her readers. They missed the mountains, they sighed for the East Tennessee moon and for the whip-o-will's cry. Well, they will have all these in *The Windfall*, for she has gone back to the mountains with a street fair, a lofty tumbler, a rustic beauty, an auburn-haired hero and a bunch of society people. And she has written a very clever story with as much of the old fashion charm as can be preserved now. The story is extraordinary, however, only in the fact that it contains a three-handed heroine. The reader's first glimpse of her is dancing under a peach tree and leaping up to reach a peach hanging upon the bough above her, while she held a lap full of grapes in one hand and a piggin on her head with the other! If Miss Murfree could have introduced a safety pin with which to catch up the skirt in front, the effect would not have been so startling, of course, but it would have been more natural. Fortunately, she has not meddled with the Great Smokies, and the book is worth reading for the descriptions of them which it contains.

Sixty Years With Plymouth Church. By Stephen M. Griswold. 12mo, pp. 191. New York: Fleming H. Revell Co.

The author's connection with Plymouth Church began four years after Mr. Beecher came as its first pastor. The present volume is not a history of the church, such as was lately published of the Broadway Tabernacle in New York, but is rather a series of notes and impressions attached to a thread of facts. Naturally to the author the great predominating figure is the first pastor, altho full credit and honor are given to the two very able men who succeeded him, Dr. Abbott and Dr. Hillis. A fair account is given of the origin of the church, and, naturally, a very slight account of the trial of Mr. Beecher, with a view of involving the name of no one. The book has an excellent spirit, and gives a correct impression of the im-

mense influence the church had in favor of freedom all over the country. We may mention one error, that which makes Mr. Beecher one of the first editors of THE INDEPENDENT with Drs. Storrs and Thompson. The name should have been that of Dr. Leonard Bacon.

Rubaiyat of Omar Khayyam. By George Roe. Chicago: A. G. McClurg & Co. $1.50.

Ecclesiastes in the Metre of Omar. By William Byron Forbush. Boston: Houghton, Mifflin & Co. $1.25.

However superfluous another translation of Omar may appear to the laity, Mr. Roe's new metrical version may be of value to the cult. His avowed purpose in making it is, first, to find a middle course between those translations which sacrifice literalness to beauty and those which sacrifice beauty to literalness; and, second, to set forth more fully than Fitzgerald did the Vedantic doctrine of the ultimate reabsorption of the soul in the Brahman or Impersonal Self of the Supreme Spirit. The preface is interesting reading, and evidences the author's earnestness of purpose. The copious marginal notes give comparative readings of all recognized translations as well as references to manuscripts and reproductions where Persian texts may be found. A comparison of several of Mr. Roe's quatrains with those of Fitzgerald enhances the value of the latter, tho occasionally the new version is particularly happy in the very qualities characteristic of Fitzgerald's touch, as in the following:

"Naught speaks the ball, but right or left it goes,
As fate's relentless mallet strikes the blows;
But he who tossed thee to the game's mad rush,
He knows the reason, aye, He knows, He knows."

But forbearance ceases to be a virtue when called upon to applaud the forcing of any other piece of literature into the justly famed form of Omar's quatrain. The form of any sort of composition is as essential to it as the matter. It is the outward and visible expression of the inward quality, whatever that may be. Disguise never reveals; its mission is to conceal, to deceive. The similarities and contrasts between the Hebrew poet-philosopher and the Persian Omar, which Mr. Forbush has set forth in the preface of his book, are of interest and value to the lover of literature. They are, however, of the spirit, of the matter. If any one believes that a form created a thousand years later in Persia, translated another thousand years later into English, would enhance the characteristic vigor of Ecclesiastes, let him read and be convinced:

"Old time, Man's Warder, crouching at his door,
Gibes at the generations as they pour
Like footless cloudheaps driven by shepherd winds
Thru life's ironbound ravine forever more."

"One generation passeth away, and another generation cometh; but the earth abideth forever."—Ecclesiastes 1:4.

The Cruise of the Shining Light. By Norman Duncan. New York and London: Harper & Bros. $1.50.

In a retrospect of Mr. Norman Duncan's work the discerning reader must perceive that two themes possess for this brilliant and wholesome writer an especial and perennial fascination: the heart of childhood and youth and the passion of maternal love. And we readily believe that it was the spell laid upon him by the first of these themes, not a lack of artistic flexibility, which constrained Mr. Duncan to repeat in *The Cruise of the Shining Light* precisely the method of "Dr. Luke of the Labrador," and make the story an unfoldment by the hero of his span of life from early childhood to early manhood. To the accentuated reappearance in this book of the unmodern style which characterized Dr. Luke we are less reconciled. It is not too much to say that the "Letters" of Chesterfield — that astonishing *vademecum* of Mr. Duncan's unlettered and unkempt skipper, old Nicholas Top—are less far removed from modernity in style and diction than is *The Cruise of the Shining Light;* and Chesterfield died in 1773. To be sure, the romance supposedly proceeds from the pen of Dannie Callaway, a Newfoundlander born and bred; but Dannie belongs to the day of the mail steamer circling the island's coast, he has been educated by an English tutor nurtured in university halls, he has had access to the literature

of the end of the nineteenth century, he has traveled with his tutor abroad—and we can conceive no reason why Dannie or Mr. Duncan should revert to the English of a long-gone age. We deplore the anachronism, for it must surely militate against Mr. Duncan's significance in literature as representative of his time, a position to which his rare gifts entitle him to aspire. Again, Mr. Duncan betrays here and there a heart "all too soft" for the grim task of the delineator of life. It is incredible, for instance, that a hatred so mordant as that inevitably and confessedly engendered between Top and Dannie, on the one part, and the scoundrelly "Gray Stranger" of St. John's, on the other, could ever have evaporated to "genial intercourse afterward." Yet, overmastering at times as are the impulses of Mr. Duncan's large humanity, they have not saved him from a singular inconsistency in the character of Top. Skipper Nicholas, extraordinarily fine-grained under his monstrous exterior, has but one object in life—the comfort, happiness and welfare of his foster-child Dannie; and he attests his devotion by almost miraculous self-sacrifice, which embraces the deliberate forfeiture of his future to the Enemy of Souls. Nevertheless, repeatedly and insistently, he informs the sensitive lad that his father is in hell. But when upon honor the critic has said so much, he finds remaining only the grateful pleasure of praise. *The Cruise of the Shining Light* is a romance beautiful and strong. If inwoven with the quaintness of an older literature, its style is none the less an unfailing delight: so lucid, so vivid, so picturesque, so infused with the quality of charm that among contemporary writers of fiction in English few outrank Mr. Duncan in literary technique. It would be hard to find in the pages of fiction a character more minutely studied, more vitally incarnated, more magically visualized than the grotesque, divinely loving, eternally loyal old sinner, Nicholas Top. But, to our mind, the triumph of the book is the Fool. He whom nature has made weak of wit, but left sound of heart, has always appealed to the tenderness of the highest genius; and Mr. Duncan's Foôl almost persuades us that his creator belongs in the glorious company of geniuses.

Salvage. By Aquilla Kempster. New York: D. Appleton & Co. $1.50.

In *Salvage,* Aquilla Kempster shows his knowledge of English and American life. Richard Wayne's loss of memory from a blow on the head, recalls Hugh Conway's "Called Back," so popular twenty years ago. The characters are alive and the atmosphere is fresh. The heroine, Joyce is a charming type of American girl, wholesome, radiant, piquant. The metamorphosis of John Peters, his assailant, the drunken vagabond, to Neil Carson, the high-minded and successful cotton king, is extraordinary in spite of the hiatus of seven years. Physicians say that the fibers of our bodies are changed in that time, and the same is measurably true of our characters. The reality of the tale is enough to make the reader desire a more detailed account of that change, which, from a psychological standpoint, would be more interesting, and, perhaps, more difficult to depict than the bright romance that follows. The ending is fortunate and we are glad of it, altho Richard Wayne does not deserve his wife's devotion, a touch that enhances the lifelike qualities of the tale. It leaves the reader with the feeling that the world is not such a very bad place after all, and even villains have their redeeming moments.

The Veiled Lady, and Other Men and Women. By F. Hopkinson Smith. New York: Charles Scribner's Sons. $1.50.

Mr. Smith has been called "The Thackeray of American fiction" by the Boston *Herald;* to our mind there is less of Thackeray than of Dickens in his stories. There is so little of the cynic and so much of the humanitarian in "the Staid Old Painter," as he calls himself in this his latest volume of gentle tales, that we rejoice in the sentiment of an older fashion and the mellow mood of most of the stories, with a little wonder that he should have been likened to the author of the "Book of Snobs." Mr. Smith is sentimental, but never satirical. He does not seem to know, or to care, anything about the bank accounts of his characters, and apparently no snobs live

in his kindly Bohemia. He is busy about more vital matters. Most of his friends are gentlemen, not even excepting Nurse Jennings, who was large-natured enough to overlook a technical offense against a woman's delicacy in order to save a human life from shipwreck. She is fine and strong, and we gladly take off our hat to an unusual type of woman.

Literary Notes

....Articles on English politics and even English novels are often obscure to Americans who do not catch the local allusions. Montgomery's *Dictionary of Political Phrases* (Dutton, $2) is therefore a handy thing to have on shelf within reach.

....John Lane Company are sending out printed index cards of standard library bureau size for all their new books. This is an excellent idea and should be adopted by other publishers. We would all have our libraries indexed up to date if we found in every new book a card ready to drop in the drawer.

....To the book list on the new international language, Esperanto, which we published March 21st, we would now add *Esperanto in Twenty Lessons,* by C. S. Griffin (Barnes, 50 cents). The "Twenty Lessons" promise has been made before in regard to other languages but in this case it is not an exaggeration.

....Muck-raking has now passed over from the pessimists to the humorists. Wallace Irwin, in *The Shame of the Colleges,* exposes the skeletons in the closets of Harvard, Vassar, Princeton, Chicago, Yale and West Point. Let the other colleges look out for the second edition or volume. (Outing Pub. Co., $1.25.)

....Any one in search of a reliable, popular and interesting account of the ancient texts and manuscripts of the Bible, both Hebrew and Greek, and also of the various English versions and translations, would do well to secure *The Ancestry of Our English Bible,* by Professor Ira Maurice Price. (Philadelphia: The Sunday School Times Co. $1.50 net.) In concise form and with careful regard to accuracy, the salient facts in regard to the history of the texts of both Old and New Testaments are brought forward, and an entire section of the book is devoted to the fascinating story of the successive English versions. There are nearly fifty excellent illustrations, mostly from photographs of manuscripts.

....Students of the Old Testament will find a valuable addition to their books of reference in the translation of Professor Cornill's *Introduction to the Canonical Books of the Old Testament,* by the Rev. G. H. Box, M. A. (New York: G. P. Putnam's Sons.) This standard work appeared first in German in 1891, and its popularity is indicated by the fact that the translation is made from the fifth German edition. Questions of analysis, authenticity and date are naturally prominent, but the relation of books and documents to the history of religion is not forgotten, so that this introduction has more of human interest than some works of its class. Appreciative literary judgment and great patience in taking pains unite to make Professor Cornill a critic of high order.

Pebbles

THE Man (in street car)—Take my seat, madame.

The Woman—Thank you, but I also get out at the next corner.—*Chicago Daily News.*

A FIEND.

"THE meanest fiend I ever knew," said a member of the Century Club yesterday, "was a fellow who used to belong to this club. He used to bore us for hours telling of the smart sayings of his children. It was something fierce. Finally he left town, and we discovered that he had no children—he was an old bachelor. He'd been springing that line of stuff for years, just to watch us writhe!"—*From the Cleveland Leader.*

THE BIRTH RATE.

"THE Scotch," said Secretary Wilson, of the Department of Agriculture, "are certainly a witty people. Now, there was a visitor in the little town of Bowdoin, who, on looking about, saw no children, but only grown men and women. He wondered at this, and, finally, meeting a weazened old man on the street, inquired: 'How often are children born in this town?'

"'Only once,' the man replied, as he proceeded on his way."—*Saturday Evening Post.*

RATTLED.

HE had been told that he might "ask papa," and he had planned to do it in these words:

"I dare say that you know, Mr. Rocks, that I have been paying your daughter Madge marked attention of late, and now I have come to ask her hand in marriage. I know that I am a poor man, but I am an honorable one, and I am not afraid to work. We are willing to fight the battle of life as bride and bridegroom, pilgrims of life, together. I love your daughter devotedly, and I have come to ask your consent to make her my wife."

That sounded all right when he read it for the fiftieth time from the sheet of paper on which he had written it; but this was what he really said when he stood before Mr. Rocks, with his teeth chattering and beads of cold perspiration on his brow:

"I—I—dare say that—that is, Mr. Rocks, I—I—your daughter Madge has been paying me marked attention—er, no, I have been paying her marked attention, and I—I—we are willing to fight—or the battle of life—I mean that your daughter seeks my hand in marriage, er no, I—I—seek her hand and—and—I love you—or no, your daughter I mean she—she—that is, I—I—have come to ask your consent to be my wife—that is, I—love you devotedly—your daughter I mean—she loves me devotedly—no, I mean that I love her—and she—she—I trust I make my meaning clear, sir."—*Lippincott's Magazine.*

Editorials

The Independent

Publisher, Clarence W. Bowen.
Owner, The Estate of Henry C. Bowen.
130 Fulton Street, New York.

THE semi-annual index of THE INDEPENDENT for the first six months of 1907 is now ready and will be sent free to any subscriber who will notify us that he wants a copy. Of course those who return us the twenty-six issues of the magazine will have the index bound in the volume.

Jail Instead of Fines

THERE is a widespread desire that the punishment of offending officers of great corporations by imprisonment shall be substituted for the punishment of the corporations themselves by fines. A railroad corporation capitalized at $100,000,000 suffers no real punishment when it is required to pay a fine of $15,000. With this popular desire for the use of jail sentences there may be observed the beginnings of a popular belief that wealthy officers of great corporations who deserve to be punished escape punishment for reasons discreditable to official prosecutors and the courts. The real reasons which make it extremely difficult, if not impossible, to send to jail the corporation managers who are commonly believed to be guilty of prison offenses are not clearly seen by the public. In his address at Jamestown on the 4th, President Woodrow Wilson said:

"One really responsible man in jail, one real originator of the schemes and transactions which are contrary to the public interest legally lodged in the penitentiary, would be worth more [to the cause of reform] than the mulcting of a thousand corporations by fines. . . .

"Every corporation is personally directed either by some one dominant person or by some group of persons; somebody in particular is responsible for ordering or sanctioning every illegal act committed by its agents or officers; but neither our law of personal damages nor our criminal law has sought to find the responsible persons and hold them individually accountable for the acts complained of. . . .

"We indict corporations themselves, find them guilty of illegal practices, fine them, and leave the individuals who devise and execute the illegal acts free to discover new evasions and shape the policy of the corporations to practices not yet covered by the prohibitions of law."

Undoubtedly he had in mind the unlawful rebating of railroad companies. But the law under which the railroads have been prosecuted for rebating provides no prison penalty. There had been such a penalty, but it was thoughtfully repealed, owing to the influence of certain prominent men in Congress whose constituents have not since expressed resentment by retiring them to private life. If the people continue to support such representatives they should not complain of their legislative acts. In the new law there is a prison penalty, but the suits to which public attention has been drawn were brought under the old statute. President Wilson will admit, of course, that neither corporations nor their officers can be prosecuted for "practices not covered by the prohibitions of the law," however objectionable these practices may be.

It should be borne in mind, moreover, that prominent and guilty officers of corporations have gained immunity, under the laws, by testifying as to their own unlawful acts. This accounts for some failures to prosecute. Also, it is well known that corporations (and officers of them) that have indulged in practices highly objectionable and against the public interest, if not clearly illegal, have been aided and guided by the advice of those "astute lawyers" whom Mr. Roosevelt has repeatedly denounced, and have thus insured themselves against successful prosecution. The shaping of legislation for the protection or the use of such offenders has not been an unheard of

thing, but for that the people should complain to their own elected lawmakers.

For him who steals a few dollars there is sure and swift punishment if he be caught. It is unfortunate that persons whose offenses against the public are immeasurably greater may avoid any punishment whatever, but in many instances this is the fault of the people themselves, and not the fault of prosecutors or courts.

As a result of the recent prosecution of land thieves in the West, many prominent and wealthy men—among them three or four millionaires and several bankers—have been sent to jail. But, if they were officers of offending corporations (and some of them were), they had been personally and directly concerned in frauds as to which there was no question. Their criminal acts were easily separated from the general conduct or management of the corporations. They did not seek to acquire immunity, and a prison penalty was provided for violation of the laws which were broken by them.

In the case of great corporations engaged in transportation or manufacturing, the problem is how to fix individual responsibility by law without impairing the value of corporations as instruments of material progress, and it is a problem not easily solved. It is quite possible that drastic legislation fixing such responsibility would do more harm than good. Offending corporations are now virtually inviting such legislation by their attitude toward reasonable official regulation as well as by their approval and support of officers who have been found guilty in the courts or whose unworthiness has been exposed by public official inquiry.

There is much virtue in enforced publicity, accompanied by wise official supervision. So far as the railroads are concerned, the new law's provisions for publicity thru the agency of uniform accounts and an official inspection of them should be tested before resorting to new projects for exactly determining the responsibility of individual officers. It will occur to every one that the offenses which have caused so much complaint and public resentment were committed in secrecy, and that perhaps no one of them would have been committed if publicity could not have been avoided. Now that the light is to be turned on, let us see what the effect of it will be.

More Church Union

It is clear that the movement for the union of the Methodist Protestants, the United Brethren and the Congregationalists is moving forward favorably. A very few Congregational city churches surprised the three denominations by voting against it, but the overwhelming sentiment is in its favor, and the State conferences which have shown any hesitation have done so not because they do not desire the union itself, but because they wish, if possible, to have such amendments in the terms as will assure unanimity. It is past credibility that the Congregationalists, who have boasted of their hospitality to union, should fail when the opportunity comes to them. Those few who are so afraid that liberty will be endangered should not forbid liberty to unite. *The Methodist Protestant* says:

> "Those voting against it have much to say of the liberty of the local church. They are much concerned about the autonomy. We venture to affirm that no Congregational church has more liberty in the management of its own affairs than the local churches in the two other denominations."

While the summer is a quiet time for ecclesiastical movements, we observe that the committee of the Free Baptists on union with other denominations will meet in August to prepare its report to the national body. They are discussing the question of union with either the regular Baptists or the Congregationalists, and the union with one or the other seems desirable and probable. As to which body will present the most advantages it is not for us to say. The persistence with which close communion prevails in some parts of the country among the Baptists will present an obstacle; while the fact that infant baptism prevails among the Congregationalists is an obstacle on the other side. Still perfect freedom as to the ordinance is accepted and such union might profitably widen the Congregational doors, if possible.

Meanwhile there is talk of union be-

tween the English Baptists and Congregationalists. The venerable and most distinguished of English Baptists, Dr. Maclaren, whose writings are well known in America, has spoken in favor of such a union. He says, and says well:

"Baptists are uncommonly like Congregationalists; and why in the name of goodness these two great communities should stand isolated as they are passes my wit, and I hope passes the wit of a great many of us. It would unify our community. It would immensely strengthen our witness. It would give us far more power in the State."

What Dr. Maclaren says of union in England may well apply to union here. Doubtless the time will come when in Great Britain and in America the Baptists and the Congregationalists, who have the same principles of polity as well as of faith, will be one body.

The late weeks have been full of interest for Church union in the mission fields. On June 3 the various Methodist bodies in Japan met for the first time as a General Conference, with a Japanese bishop of their own, and with a sufficient Discipline, organized as a united and independent national Church. The missionaries of the Methodist Church, the Methodist Church South and the Canadian Methodist Church were invited to join the General Conference, subject to its rules and authority. The changes from the Discipline of American Methodism are these: The bishop is elected for eight years and can be re-elected; the presiding elders serve for four years, not re-eligible, are nominated by the Conference and appointed by the bishop; the annual conference is composed of the ministers and a lay delegate from each self-supporting charge; the Wesley Endeavor Society takes the place of the Epworth League. But perhaps more important is the reduction of the Articles of Religion from twenty-five to eighteen. The Article 16 on the Civil Government is as follows:

"Believing that the powers that be are ordained of God, as taught in the Holy Scriptures, we revere the Emperor, of one ancient and unbroken lineage, who is the rightful sovereign of the Empire of Japan, respect the constitution, and observe the laws."

Of the very greatest importance has been the meeting in Shanghai of the missionaries of the various Protestant missions in the whole of China. There had been no such meeting for seventeen years. They have not yet organized one united Chinese Church of Christ, nor is it yet possible to consider so large a scheme, but its desirability was freely admitted, and questions of immense general interest were before the body, particularly that of education, on which the various denominations are coming together. It is a hundred years since Dr. Morrison began the Protestant mission work. Last year the members of Chinese churches with their catechumens counted 256,779, with 57,682 pupils in schools, and 3,833 foreign workers sent by 82 societies, and the growth is now very rapid. This Centenary Conference did all that it could toward union by recommending the formation of a federal union under the title "The Christian Federation of China." This follows the organization of the Federation of Churches in this country, and anticipates closer union of kindred missions, as in Japan and India. Thus, in South India, the Dutch Reformed, Congregational and the Free Church of Scotland have achieved the Union Church of South India, which includes 150,000 Christians, and other bodies are expected to unite with it. Union is a predominant note in the Church today.

And yet we observe that some who question and doubt or refuse are begging the advocates of union to stop repeating our Lord's prayer "That they may be one."

For Law and Order

We made recent editorial mention of the good work being done by former Governor Northen to promote peace, law and order throughout the State of Georgia, and we are happy to note that this aged but vigorous man is continuing his efforts in that line. But there was another movement that sprung up at the time of the riot with the purpose of taking Atlanta for its field of operation. We refer to the Civic League instituted by Mr. Charles T. Hopkins, an attorney at the bar. The Civic League has scored a victory for law and order by securing the conviction and execution of the real cul-

prit whose heinous crimes, by his own confession on the gallows, furnished the excuse for the bloodthirsty mob that devastated the city last September.

It came about in this way. Not long after the riot one of the most heinous assaults was reported from the suburbs of the city. Suspicion pointing to a certain negro, he was arrested, taken before the victim and identified; upon this he narrowly escaped being lynched on the spot. When he was safely landed in the Atlanta jail, Mr. Hopkins went to the judge on his own motion and advised with him as to the necessity of having a speedy and fair trial for the accused, in view of the state of public feeling. With this the judge agreed, and to the surprise of Mr. Hopkins appointed him and one other to defend the prisoner. Tho reluctant to take up the case and believing the prisoner guilty, they decided to go into the matter in a professional manner. Their investigation convinced them of the prisoner's innocence. On the day of the trial the jury exonerated the prisoner in the face of the positive identification of the victim.

One of the elements in the evidence that secured the acquittal of the prisoner was the bringing into court during the process of the trial another suspect who accurately fitted the description. This second prisoner was tried on another similar case and convicted. Stoutly denying his guilt his case was appealed to the Supreme Court of the State, and, convincing many of his innocence, an appeal was made in his behalf to the Pardon Board and to the Governor, all to no effect. Standing on the trap-door of the gallows the doomed wretch surprised all by confessing to the crime with which the first prisoner referred to was charged, and also to the series of crimes that had stirred the whole city and had occasioned the riot that startled the country. For one of the crimes to which he confessed another negro was serving a forty-year sentence in the chain gang; an effort is being made to secure his release.

Thus the city has been given an ocular demonstration of the superiority of the orderly processes of law over the spasmodic action of the mob. But for the interest manifested by Mr. Hopkins and those associated with him it is evident an innocent man would have been hanged, and likely the real culprit left free to continue his diabolical crimes, possibly inciting another riot. Thru the activity of Mr. Hopkins the attitude of the whole Atlanta court has been changed toward the negro criminal, and the ends of justice are being advanced.

The confession of this criminal, which was made in the presence of colored men as well as white, has led the colored people to be less skeptical when such a crime is reported, and to take a deeper interest in the co-operative movement for law and order. It seems to us that the attitude for the colored people to take is not that of wholesale denial of the commission of such crimes by a certain class of the men of their race, but to recognize that there are such vagabonds made so by conditions, but that they are in no sense representative of the race and that this is no race trait, but a trait inherent to certain conditions. Clearly it is to the interest of the colored race to ally themselves with the better element of white men like ex-Governor Northen and Mr. Hopkins, who are making a very brave fight for law and order in Georgia and the South. We repeat what we have said before, that this movement reactionary from the riot seems to us the sincerest attempt yet made in the South by Southern white men to ameliorate actual conditions, and what has been done in Georgia is a real contribution to the solution of the Southern problem. And in this co-operation of the better elements of both races we of the North can but heartily rejoice, inasmuch as this points the way to the ultimate solution of this vexed problem.

But now that the black criminal who incited the riot has been disposed of it would make an impression on the country not hitherto made if the white criminals who led in the riot were similarly dealt with.

The Ethics and Etiquet of Photography

TOURISTS who have loaded themselves with rolls of films for use in Europe this summer will have to be careful when they go to Germany. In that thoroly

regulated country a new law goes into effect July 1st prohibiting the photographing of any person or his property without his express permission. The law, it appears, is most comprehensive and explicit. You are not allowed to take your neighbor's house, nor his wife, nor his man servant, nor his maid servant, nor his ox, nor his ass, nor anything that is your neighbor's. He can, of course, give you a written authorization to photograph his city residence, but you must see to it that no rays from an adjoining building enter the lens. Taking a landscape under these restrictions would be difficult. Unless one secured all the necessary permits his birdseye view would look like the map of a Western State with the railroad land grants marked out. In snap-shotting a street scene it would certainly be embarrassing to have to ask the permission of all the passers-by.

But Germany leads the world in this matter of State control. The Government tends to prohibit everything that can be prohibited and many things that cannot. Photography belongs in the latter class. Nowadays one can take pictures with a book, a music roll, an opera glass or his vest button. The police cannot prevent the taking of photographs, but only the taking of good photographs. In this country we often hear a demand for similar laws restricting the kodak fiend, and no doubt some of our States will add them to their line of fancy legislation. There are undeniably abuses in our present free and unlimited practice of photography, but they are not such as can be remedied by law without improper interference with the rights of the camera. What these are cannot be exactly stated, for our mentors of morals and manners have neglected the subject.

As regards photography in public it may be laid as a fundamental principle that one has a right to photograph anything that he has the right to look at. The silver bromid plate is similar to the retina of the eye, tho more sensitive. The impressions made on both can be fixt, the one by pyro and hypo, the other by the memory, and their permanence depends in both cases on the perfection of the optical instrument and the skill of the operator. The artist can remember a scene and sketch it afterward almost as accurately as a photographer can record it. One ought not, therefore, to object to a third crystalline lens under circumstances where he does not object to the use of the two with which nature has provided the spectator. Of course a person has no right to snapshot a stranger in a ridiculous or embarrassing position any more than he has a right to gaze into the window of a private house when the window shade has been accidentally left up, but when one appears in public it is always with the expectation and often with the purpose of being seen, and nowadays he must also anticipate being photographed. If an orator frowns and shows his teeth to a thousand he cannot—and he does not—object if a million see it in the newspapers. If a lady has an ungraceful walk or a silly smile, should she not herself share in the discomfort that these traits give to her admirers? The real ground of the grudge that most of us have against the snapshotter is that he confers upon us the gift that the poet unwarrantably assumed to be a common desire of mankind, to see ourselves as others see us.

It has been urged against the instantaneous photograph that it represents a transitory expression, and to make this permanent is in itself a falsification, a distortion. It is true that early sculpture was limited to moments of repose, but this restriction has been removed from art since the time of Phidias, and in these days of agitated painting and snapshot statuary it is vain to appeal to it. A horse standing in an attitude of quadrupedal repose looks with an expression of contempt and disapproval at Remington's group of the four cowboys shooting up the town. He evidently feels that even in his most rapid moments he never forgot his dignity so far as to take such a posture, one leg or less on the ground and the other three or four sprawled out like a water-spider on a mud puddle. If he is to be perpetuated in bronze he would undoubtedly prefer the conventional rocking-horse pose. So, too, some of our celebrities would prefer to look like the wooden Indians that people our parks than to have their impassioned, unconscious and characteristic attitudes preserved to posterity by a silver film.

The pictures taken by strangers with-

out our knowledge are, after all, not so apt to annoy us as those taken by our friends with our own consent. These turn up at most inopportune and embarrassing times. Picnic pictures are particularly dangerous. Few ladies look their best when eating a banana, and borrowed hats are not often becoming to gentlemen. It is all right for the judge and the bishop to do stunts on the limb of a tree when they are camping out, but the photographs are not so attractive when they appear in a magazine. It is useless for the law to attempt to protect us from strangers when we cannot protect ourselves from our friends.

Commercializing Military Titles

THE War Department does not propose to have army officers making a "commercial asset" out of their titles. Some complaints have reached Secretary Taft alleging that certain army officers have allied themselves too conspicuously with mining concerns and other business ventures which appeal for public subscriptions in the form of lucrative investments. Of course, the dignity and integrity of a business enterprise of any character are supported by the announcement that this or that army or navy officer is connected with the institution. In the same way publications which are not official, and which are not connected with the various military societies formed by army officers, are considered as not entitled to the activity of officers. The position of the War Department in the matter is set forth in a letter which is being sent to army officers whose desires for additions to their service pay have led them to employ their personal efforts in behalf of or lend their names and titles to interests which are not strictly professional. This communication states:

"The Government is, generally speaking, entitled to the exclusive right to the time, interest and talent of army officers. A commercial spirit is incompatible with such views. An army officer cannot engage in any commercial enterprise for the purpose of personal gain without devoting thereto part of his time, interest and talent. An officer's title is conferred upon him for use in the military service, and it is not considered that he has any right to use it as a 'commercial asset.' It is considered that an officer of the army who uses his title to advance the interests of a commercial enterprise places himself in an attitude unfavorable to him as a soldier. The display of his uniform or title for the purpose of advertising a private business is in bad taste, if not reprehensible.

"It is not considered improper for officers to contribute articles, especially on military or professional subjects, to periodicals generally for the dissemination of knowledge beneficial to the service, but the Department does not approve of officers acting as agents or solicitors for commercial publications or enterprises of any character."

This seems to be an eminently reasonable rule. But we may consider how far the same principle will apply to college teachers, to clergymen whose services are supposed to be paid for by a church, or to the paid officers of a financial institution. Such a one may write for the journals on subjects allied to his profession, but can he lecture promiscuously on miscellaneous topics for hire, or sell his name to a subscription book or a medicine? The principle must reach beyond the United States Army.

A New Outlook

WHEN Mr. Hill made his speech before the Chicago Commercial Association, urging a return to agriculture on the part of the American people, and a withdrawal of our energies from building huge cities, he touched the very core of our social problem. There will be little dispute that the only resource we have for meeting our very rapid growth of population is to increase the productivity of the soil. Nor is it questionable advice, when we are told that the attention of our people must be largely applied to other occupations as subsidiary to soil tillage. In mere self-preservation the United States must give more serious attention to restoring agriculture to its original and natural position. Not only do the farms stretch out their hands for more skilful and thoroly educated workers, but the farmer vainly offers wages unheard of in other lands for unskilled labor. While our only resource is increased productivity of the soil, the taste of our laboring classes is, at the present time, too strongly biased toward mechanical industries and a herded method of life. To this state of affairs Mr.

Hill points, and, we think, with great judgment, affirms that there must be "a national revolt against the worship of trade and manufacture as the only forms of progressive activity." It is not merely more agriculture that we want, but more agricultural sentiment and agricultural taste. Within twenty years we are assured that we must house and employ at least fifty millions of additional population. Elihu Root, in his speech at St. Louis, not only confirmed Mr. Hill, but affirmed that our people are steadily consuming a larger proportion of their own productions. If we would hold both the home market and the foreign we must greatly increase our productive capacity.

Mr. J. Ogden Armour, in response to Mr. Hill, offers $5,000 annually, in the form of scholarships, to be competed for by State agricultural colleges, at the International Live Stock Show. This is a distinct movement away from the establishment of prizes for literary attainments. The college catalogs are full of prizes for competitors in the ancient languages and modern, as well as in philology and chemistry; but for the practical affairs of everyday life, the industrialism that must underlie prosperity, manhood and real intellectual merit, the awards are not in such catalogs. Nothing could be more foreign to them than to offer a prize for an improved wheat that would give us ten bushels more to the acre, and so revolutionize half the civilized world, or for a better method of competing with insect and fungoid enemies, and so saving to the United States annually $200,000,000.

But we must not overlook the trend of this sort of thinking and working. Supposing Mr. Armour and Mr. Hill and the rest of our capitalists, who are now endowing universities and colleges, should get their eyes wide open to the fact that our age needs not only our classical colleges, but that it also needs a system of plain, practical industrial institutions, to teach English language, English life, English duties and English morals; devoted to the development and the sustenance of the practical industries and to handicraft. Suppose the great endowments begin to go to the foundation of schools for bread-winning as well as brain-brightening. Let us go farther, and foresee in every State an industrial system, solidly established and thoroly endowed; State universities handling economic, social and industrial questions, laboring for the advance of agriculture and manufactures, and for the baptism of the commonest labor with science; and then let us foresee that these great central institutions are based upon a complete industrial system, from primary school to high school, so that every boy and every girl may in this way face toward and prepare for useful citizenship. We do not suggest even anything derogatory to the dignity and the glory of these older studies, nor do we hint that they should be discharged from farther duty in the cultivation of mankind. Is it not possible, however, that State schools and State institutions, with State universities, may be most wisely called upon to teach those studies which will best serve the whole people and best secure the permanence and power of the State itself?

The Civic Federation's Report

After nearly two years' study the Civic Federation, representing both capital and labor, has made two reports, one by Professor Commons, in general support of municipal ownership, and one by J. W. Sullivan, who represents the clothing trades, against it. On this they agree, that the danger in municipal and in private ownership is the same—the invasion of politics. It must not be thought that political control is confined to either method. Professor Commons is positive that the best way to get rid of politics in municipal ownership is to unionize the workmen. In that case they would protect each other, and secure labor and permanent tenure without favoritism. But Mr. Sullivan is sure that if, under public ownership, the workmen are unionized, the union will be in politics to increase wages, but will not be strong or permanent, for the men will be protected by civil service rules, and not be dependent on their unions, and so will cease to pay assessments and drop off, especially when, as is likely to be the case, old age pensions and accident rights are given by the municipality. Why should they pay

union dues when the city gives them all that the union has to offer? Both reports tell of scandalous political conditions in a number of cities, as in Wheeling, Syracuse, Allegheny, Indianapolis and Philadelphia; while it is pleasant to be informed that civil service rules are ironclad in Chicago, and things are pretty good in Detroit and Cleveland. It is not to be expected that municipal ownership will instantly remove evils. The unions will be powerful political agencies when an increase of wages is wanted, and in the intervals are likely to be very ineffective. It will require the most sedulous care to eliminate politics, but it would be difficult to get more politics into municipal ownership than we have seen in private ownership. There would certainly be less temptation to bribery, and workmen could expect safe tenure of service.

Brownsville and the President

Like the President, THE INDEPENDENT is in danger of losing the good opinion of the negroes because we are not convinced that the negro soldiers did not "shoot up" the town of Brownsville. Neither are we convinced that they did. We have a letter from one of the ablest colored men in the country, Francis J. Grimke, of Washington:

(1) "The negroes declare that they will not vote for Mr. Taft, nor for any one else whom President Roosevelt will favor. It is amazing, as it is unjust, that so deep and so general a feeling has been aroused." Is it amazing? How would white men have felt under similar circumstances? Is it unjust? "With what judgment ye judge, ye shall be judged; and with what measure ye mete, it shall be measured unto you," is the rule under which he is being judged. And neither he, nor those who sympathize with him in his treatment of the colored soldiers, have any right to complain, or to characterize those who thus judge him as "unjust."

(2) You say: "President Roosevelt tried to do right in that case, and so did Mr. Taft." Where is the evidence that these men tried to do right? On the contrary, as Senator Foraker showed in his great speech before the Senate, everything has been done by the President and his Secretary of War to blacken the names of these colored soldiers, even going so far as to suppress evidence within the possession of the Government which positively disproved certain charges against them. The remarkable thing about it was, that the documents containing the charges were put in, while those which positively disproved the charges were suppressed. So far as the Brownsville affair is concerned, the record shows, if it shows anything more clearly than another, that the President and his Secretary of War have been determined to find these colored soldiers guilty with or without evidence.

It is unjust if, with the evidence that came to him, those soldiers were guilty. Such was the evidence he received, preponderating and to him convincing. If true the whole squadron was properly dismissed. That he was determined to find them guilty we do not believe. Our correspondent continues:

(3) You say: "The negro soldiers are not yet exonerated by the evidence." Is that a fair statement of the case? Is it necessary that they should be exonerated? The law assumes that a man is innocent until he is *proven* guilty. That is the presumption in the case of white men. Is it otherwise when it comes to colored men? You assume, in your editorial, the very opposite of this, that they are guilty until they are "exonerated by the evidence." Until the guilt of these colored soldiers is put beyond a *reasonable doubt*, you have no right, nor has any one else a right, to assume that they are guilty, and it is wrong for you to take that position in your paper. I hope that the spirit of disapprobation which the colored people all over the country are showing in the action of the President and his Secretary of War will continue, and that they will show by their votes that they do not propose to sit quietly and allow themselves to be thus unjustly treated by any political party or any set of men, North or South.

It is "a fair statement" as far as the President is related to it. He acted on the evidence, as he had the right to do as head of the army. The men were discharged. Since then an investigation has been carried on. If it should prove it probable that an injustice was done, we have confidence enough in the President to believe he will confess it and repair it. It would not be "a fair statement" as far as we are concerned, for we can—are glad to—wait. We would prefer to believe that the crime was done by irresponsible roughs and toughs in Brownsville, the kind of people that do lynching, rather than by a reputable body of soldiers.

Saul Not Among the Prophets

Religion is no joke, but it has been made something of a joke that Governor Vardaman had "got religion" at a protracted revival meeting. But the negroes took it very seriously. They warned him that if he had got re-

ligion it behooved him to mend his ways, and treat his black brothers with brotherly kindness. But now the joke is turned, for he declares that he did not "get religion" at all. He went to the meetings, and went to the mourners' bench, but he is thus quoted:

"I went to the mourners' bench in response to a call for penitents, and knelt there while the clergyman prayed, but when a call was made to penitents to surrender to Christ I did not surrender. I stated to the clergyman that I did not feel like making a surrender and stepped behind the line of converts. I attended several other meetings, but did not join the penitents."

We wish he had. He is now pushing his campaign for Senator from Mississippi, speaking everywhere with and against Congressman John Sharp Williams, who is the Democratic leader of the House, and who deserves the place. His chief cry is that as Senator he will let the people know how worthless is the negro, and that he should be disfranchised, and he proposes to have the Fifteenth Amendment repealed. What a pity, what a pity! and he was so near getting religion. If he had only surrendered! He stands a good chance to be elected. Then Tillman from South Carolina, Vardaman from Mississippi and Jefferson Davis from Arkansas! What a witches' mess that trinity will make of the Senate when they meet,

"In thunder, lightning and in rain;
Double, double, toil and trouble,
Fire burn and caldron bubble";

and no surrender.

Revising the Vulgate

The Vulgate is the Latin translation of the Bible made by St. Jerome. It revised and replaced an older Latin version. It is this Vulgate which is the authentic Bible of the Catholics, and the present somewhat corrupted text of which is to be corrected and revised, under orders from Pius X, by the Benedictine Fathers. Be it understood that there is planned no correction from the original Greek of Jerome's translation, but only the attempt to find just how Jerome's translation stood as it left his pen. In the course of copying errors crept in and finally became so numerous that in 1590 Pope Sixtus V issued the authentic edition ordered by the Council of Trent, and his successor, Clement VIII, had it revised again, and this last is now the authorized text. But there was no real criticism at that time, and a more careful revision is now needed. The Benedictine revisers are not limited to giving an accurate copy of the Sistine or Clementine Vulgate, but it will be their larger duty to study the whole question of the various schools of manuscripts, the oldest readings in the Fathers, and the whole apparatus of criticism which editors of the Greek Testament have made familiar to us. It is a very great task, and it ought to involve a reconstruction also of the Old Latin version which the Vulgate replaced, with an enormous study of manuscripts and patristic sources. The task is one of years, if not of a generation, and ought to revive the fame for scholarship of the Benedictine order, which edited so admirably the Latin and Greek Fathers a century and more ago.

Of all candidates for office, those who seek that of judges should not be charged with buying their positions. But in Fayette County, Pa., two candidates for the Republican nomination, which is equivalent to an election, spent between them $35,000, a most extravagant sum. But how was it spent? There was open and shameless buying of votes in favor of both candidates, a multitude of Democrats being hired to vote at the Republican primary. This is what is called "the dissemination of information." There ought everywhere to be a legal limit to the amount that candidates can contribute for their own election. The limit for the judicial office should be zero.

Mr. Hobson, elected Congressman, declares blithely that a war with Japan is sure to come off. Does he know that he is making mischief? Does he care? Such mouthings as that suggest and sometimes create the evil which all sensible people deprecate. He would be in less perilous and less parlous business lecturing to those, if any remain, who want to hear him, and kissing silly women. And the President and the Secretary of the Navy have made a mess of it in denying and declaring that our biggest Navy is to be sent to the Pacific Coast, which cannot but stir remark and anxiety.

Savings Bank Insurance in Massachusetts

THANKS to the interest aroused in savings bank insurance, due in large measure to the active work done in its favor by the officers of the Massachusetts Savings Insurance League and the committee of one hundred, who were hand and glove with it, the old Bay State passed, under date of June 27, "An Act to permit savings banks incorporated under the laws of the Commonwealth of Massachusetts to establish life insurance departments." Theoretical consideration of this expansion of the province of savings banks in Massachusetts will presently give way to a practical test of savings bank insurance, and we shall soon know from the experience of Massachusetts as to whether or not the idea is to work out as expected by the sponsors of the act. According to the act, any savings bank in Massachusetts may, upon complying with the provisions it contains, establish an insurance department, if its board of trustees has, at a meeting specially called for the purpose, voted so to do by a majority of two-thirds of its trustees present at the meeting and voting, and such vote shall thereafter be ratified by vote of a majority of the incorporators present and voting at a meeting called for the purpose. Not less than $5,000 in cash is to be placed at the risk of the special expense guaranty fund with which to pay the expenses of the insurance department that may be established, in case the ordinary income should prove insufficient to do so. The savings and insurance departments are to remain individually distinct. The liability for individual death losses is to be limited to $500 (maximum), and for annuities not to exceed $200 per annum. The business done in life and annuity risks under the act are strictly limited to the lives and for the benefit of residents of the Commonwealth. Savings and insurance banks must not employ solicitors of insurance, nor can they employ persons to make house to house collections of premiums. Provisions are made, however, whereby agencies may be established and other means provided for the receipt of applications for insurance and of deposits and of premium and annuity payments, at such convenient places and times, of such nature and upon such terms as the Bank Commissioner and the Insurance Commissioner may approve. The act provides for an annual examination of the insurance department of each savings and insurance bank, and the general insurance guaranty fund. The findings are to be preserved in permanent form. Reports showing financial condition must be filed with both the Insurance Commissioner and the Bank Commissioner within twenty days after the last business day in October in each year. An appropriation is made under the act of a sum not exceeding $10,000, to be paid out of the Commonwealth treasury for the purpose of carrying out the provisions of the act. The provisions of the act took effect upon its passage, but no license to do business under it is to be issued until November 1, 1907.

THE hazard of black paint on plate glass is, it appears, by no means inconsiderable. Signs painted on plate glass done in solid black paint, are in point of fact extra hazardous as plate glass insurance companies have discovered to their cost. The practice of painting signs of this kind seems innocent enough but the experience of conservative casualty companies fully justifies them in refusing to write such windows. The explanation of the hazard under consideration is to be looked for in the property of a black surface to absorb the sun's rays, by means of which, according to a writer in *Rough Notes*, an unequal expansion is produced thruout the plate and under the influence of a sudden gust of cold air or any other sudden change in temperature, a strain is developed which shatters the plate glass bearing the black paint. All black painted signs on plate glass, no matter with what exposure, must be considered as hazardous risks.

Financial

Treasury's Fiscal Year

At the end of the fiscal year, on the 30th ult., the accounts of the Government showed that the year's revenue had exceeded the expenditures by $86,945,543. Receipts, $665,306,135, had been larger than ever before, exceeding those of the year immediately preceding by $70,000,000. The increase of expenditures had been $9,500,000. To show the very comfortable condition of the national Treasury, it may be added that there was on hand an available cash balance of $264,000,000, including $78,000,000 in the Treasury and $186,000,000 on deposit in the national banks to the credit of the United States or of the disbursing officers of the Government. The year's surplus of nearly $87,000,000 is more than double the estimate made by Secretary Shaw several months ago. Of the increase in receipts, $32,500,000 was derived from customs duties, and $21,000,000 from internal revenue. So large a surplus, in the face of liberal expenditures, indicates excessive taxation and tends to promote extravagance in appropriations. Analysis of the imports shows that a large part of the increase of tariff revenue was derived from taxes upon partly manufactured materials required for use by manufacturers. Thus the additional revenue tended to increase the cost of commodities to consumers. The condition of the Treasury, as shown by the record of the year, suggests the need of tariff revision.

The Advance of Prices

Much has been said about the higher cost of living in this country, due to the increased prices of domestic products. The Government now shows how great has been the increase of the cost of imported products, by comparing the present average prices abroad with those of ten years ago. It takes for the comparison twenty-five articles which together form one-half the total value of our imports, and publishes the advances as follows:

Pig tin, an advance of 207 per cent.; copper in pigs, bars, ingots, etc., 127 per cent.; unmanufactured fibers, 117; iron ore, 108; shellac, 107; raw cotton, 69; lumber, 64; hides and skins, 63; india rubber, 59; raw silk, 57; wood pulp, 56; wool, 32; nitrate of soda, 31; pig iron, 22.

Comparing in the same way the prices of twenty-five articles which form nearly three-fourths of our exports, the Government points to the following advances since 1897:

Turpentine, an advance of 154 per cent.; rosin, 126; sawed timber, 105; copper in ingots, bars and plates, 91; apples, 91; lumber, 67; cottonseed oil, 53; raw cotton, 42; oil cake and meal, 42; meat and dairy products, 38; boots and shoes, 31; sole leather, 29; wheat, 28; corn, 27; paraffin, 26; unmanufactured tobacco, 21; steel rails, 21; wire, 15; fertilizers, 2.

Giving to each of the twenty-five articles imported its proper weight, according to the value of the trade, the Government reaches the conclusion that the average advance in the price of them has been 55.21 per cent. For the twenty-five articles exported, the increase has been 38.06 per cent.

....It is expected that George E. Roberts, Director of the Mint for several years past, will soon become president of the Commercial National Bank of Chicago, succeeding the late James H. Eckels.

....Upon the application of Bainbridge Colby, Supreme Court Justice Blanchard has granted an injunction, pending trial, to prevent the proposed merger of the Mercantile and Equitable Trust Companies, of New York.

....New securities created in this country during the first half of 1907, according to the returns of the *Journal of Commerce*, amounted to the unprecedented total of $1,278,728,500, of which $799,442,100 has been issued. In these six months the railroads asked for $979,446,600, following the announcement of $252,000,000 by the Hill and St. Paul roads in December last. Mr. Hill's memorable estimate of the railroads' coming needs was $1,100,000,000 per annum.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Relations With Japan

During the past week there has been a noticeable reduction of the space given by the daily press to gossip, interviews and speculation concerning what some have called the "scare" about an approaching war with Japan. It is still the intention of the Government to send the battleship fleet to Pacific waters, but the ships will not begin their long voyage before October or November. Some political writers who do not think that the sole object of the movement will be either naval practice or an exhibition of power suggest that the need of docks and coaling stations in Pacific waters (and of appropriations for such facilities) will be shown clearly by this cruise, that public interest in the construction of the Panama Canal will be stimulated by the time and money consumed in going around Cape Horn, and that expert politicians who desire to promote the success of the Republican party in the coming Presidential election will be glad to see the enthusiasm and patriotism of the people in the Pacific Coast States aroused by the presence of these battleships at their ports when the national conventions are held and before the national election takes place. Several possible causes of irritation were removed last week. The offensive interview ascribed to Admiral Sakamoto was repudiated and withdrawn, and the Japanese journal in which it had appeared made amends by publishing a highly eulogistic article upon the American navy. The story from an anonymous diplomat at The Hague about Japan's categorical demands and threats was declared to be false by both Governments. Ambassador Aoki said it was too ridiculous to be discussed. "There is," he added, "no 'situation' and there are no 'strained relations' between the United States and Japan." Sensational reports about the arrest of Japanese spies while making drawings of Pacific Coast forts, and concerning attempts to destroy the great dry dock "Dewey" (now stationed near Manila), were officially denied. Admiral Baron Yamamoto, Japan's noted naval strategist, arrived in New York from England on the 10th. He was entertained in the city by General Grant and others, and at Oyster Bay by the President. On the 12th he was at Mr. Roosevelt's summer home, in company with Ambassador Aoki. After his departure, the following brief official report was given to the public by Secretary Loeb:

"The President had a long interview with Admiral Baron Yamamoto, and it was most satisfactory in every way. It simply confirms what had already been made clear by Ambassador Aoki—the thoroly good understanding between the two Governments and the fundamental friendliness between the two nations."

To the reporters who met him at the dock upon his arrival from Europe, the Admiral spoke earnestly for peace. He said:

"I want to impress on the editors of newspapers that they cannot be too careful with what they write about the two countries. I want to impress on them that they must understand the conditions of the two countries thoroly before they write. There are many sensational newspapers in both America and Japan and it is a pity that they do not understand conditions before they attempt to write. I want to express the hope that the editors will be very careful about reporting correctly what one says. Very often things are exaggerated or misquoted, sometimes purposely, by

representatives of the press. I believe that the editors of the American papers are very honest and intelligent. The friendly relations between the two countries are of such long standing that I think this passing storm should be thrown into the waters of the Pacific Ocean."

At a luncheon given in his honor by the Japan Society, he replied as follows to the address of welcome:

"We all know what we owe to the United States for its services in aiding the development of our industries and commerce, and also for the education of many of our countrymen. We also appreciate the sympathy which was shown by your countrymen during the late war with Russia. Our interests, commercial and otherwise, are so intimately interwoven and the cordial relations between us of fifty years' standing are of so firm a nature that I can confidently affirm that they will never be destroyed by mere trifling incidents. It is true that lately some little dark cloud did appear in one quarter of the sky, but it is nothing but a local squall and does not in any way represent the general state of the weather. And even this slight cloud will soon be dispersed."

Report on the Harriman Railways

The Interstate Commerce Commission's report upon its investigation of the Harriman railways was given to the public last Sunday morning. It is a long review of the facts brought out during the inquiry, accompanied by recommendations as to legislation. Neither criminal nor civil prosecution is suggested by the Commission, altho acts believed to be in violation of law are thoroly discussed. The report, with the evidence upon which it is based, goes to the Department of Justice, and the Attorney-General will determine whether the questions arising shall be taken into the courts. Pointing out how Mr. Harriman became the dominating spirit of the vast railway system, the report shows that all the roads reaching the Pacific Coast between Portland and Mexico have come under his control. The Atchison may be excepted, but in that road the Harriman system has a large stock interest. A full history is given of the purchases of stock of the Baltimore & Ohio, Atchison, St. Paul, Illinois Central and other companies during the past twelve months. For these securities $131,000,000 was paid. Nothing but the law, it is said, has prevented a concentration under Harriman control of all the American roads in the Western half of the country between Mexico and Canada. A considerable part of the report is devoted to a history in detail of the memorable operations in the securities of the Chicago & Alton road by a syndicate composed of Mr. Harriman, Mortimer L. Schiff, George J. Gould and James Stillman. This syndicate increased the road's capital indebtedness by $80,000,000, but spent only $18,000,000 of this upon actual improvements or additions to the property. The great profits of the syndicate and of the banking house associated with it are shown. That competition has been suppressed thruout a great area is asserted, and the methods used to accomplish this suppression are described. Due consideration is given to the contracts and agreements affecting Senator Clark's San Pedro road and the Chicago & Alton. These were recently abrogated. The report's first recommendation is that "railroads should not be permitted to invest generally in the stocks, bonds and securities of other railways or those of steamship companies, except connecting lines." It is "in the interest of the public to facilitate the consolidation of connecting lines," for the purpose of forming thru routes of transportation. A railroad's "surplus funds and credit should be used for the betterment of its lines and in extensions and branches to develop the country contiguous to it." Funds that could have been used to develop a great and neglected tract in Oregon were invested in the New York Central, on the other side of the continent. "It is contrary to public policy, as well as unlawful," says the Commission in its second recommendation, "for railways to acquire control of parallel and competing lines." This doctrine is found in the Federal laws and in the constitutions and laws of nearly all the States. "So long as it is the policy of the General Government and of the States to maintain competition between naturally competing lines, the ownership by one railway of any stock in a competing railway should not be permitted, and such lines of railway should be prohibited from having any common directors or officers." In its third and last recommendation the Commission says:

"The time has come when some reasonable regulation should be imposed upon the issu-

ance of securities by railways engaged in interstate commerce. We are aware that in the construction of new lines of railway, developing new territory, it has been necessary in many instances to sell railway securities at large discount, and to sell bonds with stock bonuses, and even in such cases it has many times been difficult to raise the necessary capital. Men will not invest their money and take the risk for small rates of interest. But this principle does not apply to old established railway systems having good credit. Such railways should be prevented from inflating their securities for merely speculative purposes. Railways should be encouraged to extend their systems and develop the country. It is of the utmost importance also that railway securities should be safe and conservative investments for the public, and should yield good and ample returns for the money invested. Reasonable regulation will tend to make them safer and more secure investments, and thereby benefit not only the railway companies but the public."

——When Mr. Harriman was questioned about the report, the night before its publication, he said: "From what I am told, it is a political document and part of a personal pursuit of me." Criticising the manner in which copies of it had been delivered to the newspapers before the date named for publication, he added:

"It is deemed good politics to attack me. But I can stand it much better than the people of this country can stand that sort of procedure on the part of Government tribunals charged with the duty of impartially administering the laws. I shall study the report carefully and have something to say about it later. From what I am told, it is full of strange misstatements of fact."

Prosecution of the Tobacco Trust

In the District Court at New York, on the 10th, the Government began its suit against what is called the Tobacco Trust. Much public interest in this action was shown, because it was understood that for the first time in a suit under the Sherman act the Government would ask for, or suggest, the appointment of a receiver, if in no other way the judgment of the court could be made really effective. This is a suit in equity, and the complaint filed is a very long one. The defendants are 65 corporations and 29 individuals connected with them. Of the corporations the most prominent are the American Tobacco, British-American Tobacco, Imperial Tobacco, American Snuff, American Cigar and United Cigar companies. The first of these is the parent organization, which began its existence in 1890, with a combination of five cigaret companies. It now dominates the tobacco business of the world, and, the complaint alleges, is seeking to establish a complete monopoly in every branch of tobacco manufacture as well as in the purchase of raw material. Among the individual defendants are James B. Duke, president of the parent company; Thomas F. Ryan, the well-known capitalist; Pierre Lorillard, Oliver H. Payne (Standard Oil millionaire and brother-in-law of the late William C. Whitney), Peter A. B. Widener and Anthony N. Brady. The Government asserts that the defendants have violated and are violating the Anti-Trust law. It asks that they be required to appear and answer, but expressly waives the requirement of an oath, probably in order that none of the individuals may acquire immunity by giving sworn testimony. It is understood that the question of criminal prosecution is under discussion. The Government asks that all the defendants' combination contracts and agreements be declared illegal; that further observance of them be forbidden; that the Imperial Company of England (which is in alliance with the American thru the agency of the jointly owned British-American) be forbidden to engage in trade here until it shall cease to observe the combination agreements; that each one of six corporations named be adjudged combinations in restraint of trade; that the companies be forbidden to hold each other's stock, and that all the defendants be enjoined to refrain from their unlawful practices. Reference is made to receivers in the application concerning the six corporations, one of which is the American Tobacco Company. The Government asks that the court order and decree that each one of them be restrained from engaging in interstate or foreign commerce.

"—or, if the court should be of the opinion that the public interests will be better subserved thereby, that receivers be appointed to take possession of all the property, assets, business and affairs of said defendants, and wind up the same, and otherwise take such course in regard thereto as will bring about conditions in trade and commerce among the States and with foreign nations in harmony with law."

It is explained that the appointment of receivers is suggested as one method of obtaining relief, in order that the defendants may not escape by paying fines; that the business may not be tied up to the injury of the public, and that the dissolution of the combination and the restoration of normal competition may be facilitated. In the complaint it is charged that the combination is suppressing competition by threats, oppression, deception, false statements and other unfair methods, and that the producers of leaf tobacco suffer by reason of its practices. About 75 per cent. of the American output of leaf is now purchased by the combined defendants.

Philippine Church Property

Prolonged litigation has been avoided by an agreement with representatives of the Catholic Church concerning the title to several pieces of property in or near Manila, valued at a little more than $3,000,000. The Church is to hold by absolute title the Hospital of San José, $400,000; the Hospital of San Juan de Dios, $1,000,000; the College of San José, $500,000; the Hospital of San José in Cavite, $66,000, and the College of Santa Isabela, $100,000. It relinquishes to the Government (represented by Secretary Taft) all claims to the estates of Santa Potenciana and the Hospital and foundation of San Lazaro, except a tract of about 125 acres. This San Lazaro property is valued at $1,000,000, and includes a large area of valuable unoccupied land. There is a cemetery on the excepted tract. The College of San José was founded in 1601 by a legacy from Señor Rodriguez Figueroa, providing that it should exist for the Christian education of the sons of Spaniards. For a long time it was under the supervision of the Jesuits, and afterward it was in the hands of the Dominicans. At the same time the pending controversy as to the Spanish-Filipino Bank, which is controlled by the Church, was settled. The bank's claim that it should have exclusive privileges and be permitted to issue notes without restraint was abandoned. Circulation equal to twice the capital and surplus, 3,000,000 pesos, is to be allowed, and with a corresponding increase of capital the circulation may rise to 9,000,000 pesos. It is to be taxed ½ of 1 per cent. The notes (a preferred lien on the assets) will be issued thru the Washington Bureau of Insular Affairs, and will have the character and appearance of United States currency. The Government will incorporate no new bank of issue with capital and surplus amounting to less than 2,000,000 pesos.

Severe Sentences in Toledo

Some weeks ago, in Toledo, Ohio, twenty-one members of a local association of lumber dealers, two agents of bridge builders, and nine members of a brick dealers' association, pleaded guilty to indictments charging them with violating the Ohio Anti-Trust law. On the 12th, Judge Lindley W. Morris fined the brick dealers $1,000 each (their plea having related to an offense for which there is no prison penalty), but sent the twenty-one lumber merchants and the two bridge agents to the workhouse for six months. The men thus sentenced to be imprisoned are prominent in the business and social life of the city. Their combined wealth is said to exceed $20,000,000, and several are church members. Their names are given in the press dispatches as follows:

Marcus V. Barbour and Rowland Starr, of Barbour & Starr; George W. Campbell, of the Campbell Company; George L. Freeman and Hiram R. Kelsey, of Kelsey & Freeman; Reuben Kimball, president of the East Side Lumber Company; Frederick E. Witker, president, and William F. Witker, secretary, of the Witker Manufacturing Company; Edward E. Arnsman and Charles G. Bremer, of Arnsman & Bremer; J. August Van Karsen, Frederick C. Hahn and Eben D. Hopkinson, of Van Karsen & Co.; Charles W. Harris and Edward E. Washburn, of Washburn & Harris; Edward J. Goulet, of E. J. Goulet & Co.; David Trotter, of the firm of David & Albert Trotter; Clarence H. Packer, secretary of the Buckeye Lumber and Manufacturing Company; Howard M. Smith, president of the W. H. Smith Company; John H. Puck, vice-president of the Western Manufacturing Company.

Their counsel will attack the constitutionality of the law. There was proof that the defendants had combined to exact prices higher than those prevailing in neighboring cities. In imposing sentence Judge Morris said that fines were not felt by men amply able to pay. They were only makeshifts and did not bring prominent citizens to a realization of

their positions. "There must be no trifling with men of capital and social standing who come into court and admit their guilt." The term of imprisonment is the shortest which the law prescribes.

Cuba

It is expected that the strike of the cigarmakers, which began in February, will end this week in a victory for the strikers. They demanded that their wages be paid in American gold or currency. This would be equivalent to a wage increase of a little more than 10 per cent. The manufacturers were at first inclined to offer an increase of 10 per cent. in Spanish gold, but have since decided to comply with the full demand of the workmen, who have lost $4,000,000 in wages. The price of cigars will be increased.——An official statement made public at Washington shows that the cost of intervention was $2,969,395 up to April 1, and that the cost up to June 30 is estimated to have been $3,330,569. —— The Catholic Church property in Havana recently purchased was transferred on the 12th to the Government, which paid $1,387,083 for it. The Government's option for the purchase of similar property in Santiago has been extended for one year.

The Hague Conference

The Peace Conference at The Hague has so far taken no formal action of importance, but the committees and subcommittees continue the discussion and formulation of the proposals of the various delegations. Adjournment is expected about August 1st. The American delegation has presented a plan for the general arbitration of international disputes on the lines of the arbitration treaties which have been within the past few years adopted by all the important Powers except the United States. Three years ago the Senate rejected the ten arbitration treaties presented to it on the ground that they ignored its treaty-making prerogatives. According to the American proposal all differences regarding the interpretation of treaties, not affecting the honor or independence of the parties involved or the interests of other States, shall be submitted to the Permanent Court of Arbitration. Each party is to decide whether the differences affect its independence or honor. In every case arising the parties shall draft a protocol outlining the arbiters' powers and the procedure. The Court is to be composed of fifteen judges, elected by the present Conference, who shall sit annually, nine constituting a quorum. Any State may withdraw from the convention by giving a year's notice of its intention to do so. The French proposition that a formal declaration of war stating the reasons or a conditional ultimatum must precede the outbreak of hostilities was adopted by the committee having it under consideration by a vote of 31 to 2. In the discussion General Porter stated that he did not see that it was incompatible with the provision of the American Constitution that Congress shall have the sole right to declare war except in case of invasion. The Chinese military delegate said he wished he could find out what war is. Several European nations had attacked the forts and occupied the capital of China with troops, at the same time insisting that they were not at war. What would happen, he asked, if one Power declared war against another and the latter would not fight? Count Tornielli, of Italy, presented the following draft of regulations for the bombardment of unfortified towns, which is seconded by Spain, Russia, Netherlands and Italy:

First—The commander of a fleet must spare historical monuments, churches and buildings used for artistic, scientific or benevolent purposes, and hospitals, on the condition that they are not used for military purposes, and are designated by special signs, which must be displayed by the inhabitants.

Second—Before beginning the bombardment of a town the commander of a fleet must do all in his power to inform the authorities of the town of his intention.

Third—Pillage is forbidden, even in a town or locality taken by assault.

Fourth—The bombardment of undefended ports, towns, villages or buildings is forbidden, but any military work existing in otherwise undefended places can be bombarded if the local authorities refuse to destroy it.

Fifth—Undefended places can be bombarded if they refuse to furnish a fleet with necessary provisions.

Sixth—The bombardment of a town or village for refusal to pay a ransom is prohibited.

The United States has presented to the Fourth Committee on Geneva Convention a definition distinguishing between absolute and conditional contraband of war. Absolute contraband comprises arms, war ammunition, provisions and

objects destined for the military establishments of the enemy. Conditional contraband consists of objects which, by reason of their quantity or quality, if destined for the military establishments of the enemy must be regarded as contraband. Belligerents must issue to the neutral Powers lists of the objects which they regard as absolute and conditional contraband, and not until twenty-four hours after the issue of the notifications can a belligerent seize or confiscate the objects mentioned.

An Attempt to Assassinate the French President

While President Fallières was returning on July 14th from Longchamp thru the Avenue des Champs-Elysées he was shot at twice by Leon Maillé, a naval reservist of Havre. No one was hurt except the assailant, who was roughly handled by the crowd before the guard took him in charge. The act apparently had no political significance except as indicating how the revolutionary agitation connected with the recent strike of the naval reservists incites to violence individuals of weak mind or character. The anti-militarist demonstrations which were planned to counteract the patriotic enthusiasm of the national fête of July 14th did not amount to so much as was apprehended. In Paris it was confined to the hissing of the troops in the parade by groups gathered at various points along the line of march to the review. The ringleaders were arrested.——The municipal officers of Montpellier, Carcassonne and other towns in the South of France have withdrawn their resignations, but there is still a great deal of dissatisfaction and some disorder among the viticulturists because of the failure of the Government to do anything effective for their relief. The Senate and Chamber of Deputies adjourned on July 12th, leaving over for the next session the consideration of the income tax.

German Colonial Scandals

More publicity is being given to the cruelty practiced upon natives by German colonial officers thru the libel suit brought by Dr. Karl Peters against Herr Gruber, of the Socialist *Münchener Post*, for having, in the late election, called Dr. Peters "a cowardly murderer." The charges of the newspaper are based upon Dr. Peters's conduct when he acted as Imperial Commissioner in 1891-2 in German East Africa and led an expedition into the Kilimanjaro district. He was condemned for his cruelty by a disciplinary court in 1897, but the defense in this case is not able to procure from the Government the papers containing the evidence brought before that court. The Socialist leader, Herr Bebel, produced letters from missionaries to prove his abuse of natives, and read passages from his books of travel, among others the sentence: "We shot them off the trees like sparrows." Dr. Peters explained that this was intended to be humorous. Many instances of brutal treatment were adduced, particularly that of the native girl Jagodja, who was kept chained by neck and ankles and flogged every night until she died, and that of the boy Mabruk, who was executed apparently from jealous motives. Major von Donat testified that Dr. Peters had told a lot of incredible stories of his atrocities at an officers' dinner in 1896, and that he regarded him as the worst criminal that he had ever met. In defense, Dr. Peters claimed that the severity used was necessary in a military expedition employed "in opening up the dark continent to civilization," and brings forward colonial officials and members of his expeditions to prove that his conduct was not unnecessary cruel. The court found Herr Gruber guilty of libel and he was sentenced to a fine of $125 or imprisonment for fifty days. The court refused to decide whether the execution and flogging of the natives were warranted, but held that Dr. Peters was not conscious that he was committing illegal actions, altho in the case of Mabruk he may have been influenced by personal feeling. The counter suit brought by Gruber against Peters for libeling him in the *Hamburger Nachrichten* was dismissed, the court holding that this attack was directed more against the Social Democratic party in general and Herr Bebel in particular than against Herr Gruber. Both suits have been appealed and several other charges of libel have been brought against other papers on both sides. The efforts being made to have published the

reports of the disciplinary trial will probably be resisted on the ground that it would disturb peaceful relations between Germany and Great Britain to bring to light the conflict of their representatives in Africa.——Herr Bebel will interpellate the Government when the Reichstag assembles on the political aspects of the court scandals exposed by the *Zukunft,* particularly the charge that state secrets were betrayed to France by the camarilla. In the meantime the affair will be probed by a suit, in which Herr Harden, editor of *Zukunft,* will be compelled to state the source of his information, popularly supposed to be Frau von Elbe, the divorced wife of Count Cuno von Moltke. Count von Moltke and Prince zu Eulenburg were charged by this newspaper with being the leaders of a court coterie called the Round Table, which indulged in unspeakable debauchery and exerted a strong and malign influence over the Emperor. Both have been dismissed from court in disgrace.——Bernhard Dernberg, the new Colonial Secretary, has gone to German East Africa with a number of German manufacturers and promoters to investigate the conditions and resources of the colony.

Church Problems in Austria

The Catholic Church in Austria has a number of serious problems on hand that vex and perplex the authorities considerably. The Away-from-Rome movement continues, and during the past year has again lost the Mother Church 3,905 to the Protestant, making a total of 42,395 since the inauguration of the agitation in 1898. The effort to counteract the crusade thru the Bonifacius Verein is only partially successful, the number who returned during the past twelve months from the Protestant Church being 1,138, a gradual annual increase from 765 in 1899. The Old Catholic Church gained from the Roman Catholic during the same period 937, and has a total membership in Austria of 23,595. In the meanwhile, reform movements within the Church are becoming a power in the land. In Bohemia and Moravia an organization of the Catholic clergy has been effected, which demands the introduction of the Slavic language into the liturgy of the Church and the right of each diocese to elect its own bishop. In three dioceses the Slavic language has already been introduced, and in Croatia the clergy secured the privilege of using the native language by the side of the Latin, under certain conditions, and now the demand is made for the absolute right to make this innovation. The Vatican has been very much inclined to deny these requests, especially because of its fear that they will lead to the organization of national Churches antagonistic to Rome. In Hungary it is particularly the younger element of the clergy who are making demands to use the native tongue in public services, and as a matter of fact in 270 churches mass is now being said in the Hungarian language. This privilege has been confirmed by a papal decree as late as December, 1906, but demands that the old Slavic be used. On another point the Slavic and the German elements in the clergy have united, namely, in the demand for the abolition of celibacy. In 1848 this had already been granted for Hungary, and only recently the last of the married priests in that country died. The *XX Jahrhundert,* organ of the progressive elements, declares: "Our clergy is in general very unchaste." The Austrian bishops in a circular letter lately issued a special warning against this "Reformism" and "Modernism" becoming so powerful in the Church of Austria, deploring particularly that priests even publish special papers and periodicals in advocacy of these reforms, the leading one of these being the *Byli Propor.* Still more recently the Archbishop of Prague issued a public warning against the "League of Czech Priests for the Maintenance of their Rights as Citizens."

Plague and Sedition in India

The bubonic plague continues to spread in India, and during the last five months there have been more deaths than in any entire year of the past decade except 1904, when there were a little over a million. The number of deaths from plague from January 1st to May 31st were 991,003. The total number from the beginning of the present outbreak in 1896 has been 5,402,245.

The spirit of unrest and sedition among the natives has not been quelled by the arrest and transportation of the leaders and official warnings to the schools receiving Government aid not to allow their students to take part in political meetings. The students openly disregard this order, addressing boycott meetings and imploring reporters to mention their names. Native organizations called National Volunteers have branches in almost every town and village in Bengal directed by a central authority in Calcutta. They are being drilled in athletic and military exercises by well-paid professional instructors, and bear an ominous resemblance to the Boxers of China. The swadeshi boycott against all persons selling or using British goods is being enforced by stringent social ostracism. Bands of Hindus wearing the badge of the National Volunteers have held up trains and river steamers and assaulted Mohammedans. The rural police are insufficient and sometimes disaffected. British travelers on the Assam-Bengal railway carry arms for self-protection. The vernacular newspaper *India* of Gujranwala, Punjab, printed and circulated by the hundred thousand an article addressed "To the Native Forces in India," which openly advocated mutiny. In the consequent trial it was proved that the article "had been received from a sedition propagandist organization in America." The anti-foreign movement is spreading from Bengal to the French territory of Chandernagore. In Egypt the increase in the bubonic plague is used by the native press as a weapon against the British administration. Mustapha Pasha Kamel's newspaper, the *Egyptian Standard,* finding in the health report the statement that 338 deaths had occurred in the week ending June 10th, accuses the authorities of indifference to public welfare:

"Unless, of course, it is the Government's wish gradually to eradicate the native-born inhabitants from Egyptian soil, following the praiseworthy methods employed by the Anglo-Americans with the Red Indians in the United States."

The editor failed to notice that the 338 deaths on which his accusation was based were those of cattle and buffaloes caused by bovine typhus.

Foreign Notes

The Moroccan Government has sent out from Tangier and Tetuan four bodies of troops to surround the mountain fastnesses where Raisuli keeps his prisoner, the Kaid Sir Harry Maclean. In case the negotiations for his release fail an attack will be made from all quarters. The Sherif of Wazzan has been sent by the Sultan to persuade Raisuli to release the captive on acceptable conditions.——There have been numerous dynamite outrages in connection with the strikes in the Transvaal mines. At Boksburg the Crown Hotel was blown up on July 10th, and two days later an explosion wrecked Kilfoil's Hotel, killing three men and injuring more. The water main supplying the Simmer and Jack mine was dynamited and many persons wounded. At the Jumpers Deep Mine a native was caught placing a stick of dynamite where its explosion would cut off the white miners underground.——The rebellion in China has been completely suppressed by the imperial troops and the country between Foo-Chow and Amoy cleared of insurgent bands. The opium dens of the native portion of Shanghai have been closed in accordance with the edict, but those of the foreign settlement remain open. New decrees have been issued from Pekin instituting reforms in the provincial judicial and police system and extending the power of the local authorities as a preparation for a constitutional government.——The Russian Government has made public the indictments against Lieutenant-General Stoessel, the defender of Port Arthur; Lieutenant-General Fock, who commanded the Fourth East Siberian Division at Port Arthur; Major-General Reiss, Chief of Staff to General Stoessel, and Lieutenant-General Smirnoff, who preceded General Stoessel in command at Port Arthur. These officers are being tried by court-martial on charges of cowardice and treason. The indictments set forth that Stoessel and Fock deliberately sent false reports of battles that never occurred, recommending their own friends and generals who had lost battles for decorations, and surrendered the Port Arthur fortress, altho they had on hand ample means for resistance.

Round About Jamestown

BY EDWIN E. SLOSSON

JAMESTOWN ISLAND.

WE Americans are fortunate in our national heroes. Washington makes an unexceptionable father of his country; the Pilgrims are eminently satisfactory at the head of our personal pedigrees; and Captain John Smith, the hero of the summer, has many characteristics that appeal strongly to our sympathies. He was typically American in his buoyant versatility of occupation and sublime confidence in the resources of the country he was colonizing. Can any real estate boomer of the present day turn out a better bit of prospectus writing than this?

"There is but one entrance by Sea into this Country, and that is at the mouth of a very goodly Bay, 18. or 20 myles broad. . . . Within is a country that may have the prerogative over the most pleasant places Knowne, for large and pleasant navigable Rivers, heaven and earth never agreed better to frame a place for man's habitation; were it fully manured and inhabited by industrious people. Here are mountaines, hils, plaines, valeyes, rivers. and brookes, all running most pleasantly into a faire Bay, compassed but for the mouth, with a fruitfull and delightsome land. . . . The mildness of the ayre, the fertilitie of the soyle, and situation of the rivers are so propitious to the nature and use of man, as no place is more convenient for pleasure, profit, and mans sustenance, under that latitude or climat. . . . So then here is a place, a nurse for souldiers, a practise for mariners, a trade for marchants, a reward for the good, and that which is most of all, a businesse (most acceptable to God) to bring poore Infidels to the Knowledge of God and his holy Gospell."

The literary agents of the summer hotels evidently hold to the doctrine of verbal inspiration, for they take pains to point out how literally Smith's prophecies are fulfilled. The "nurse for souldiers" is obviously Fortress Monroe, "practise for mariners" must refer to the naval display in Hampton Roads, the "trade for marchants" is an allusion to the commercial activity of Norfolk, Portsmouth and Newport News, and the "businesse most acceptable to God" finds fulfilment, without more straining than is customary, in the instruction of the Indians at Hampton Institute. These exegetes have, strangely, failed to note the obvious reference to the Ter-Centennial Exposition in the only phrase not otherwise appropriated, "a reward for the good."

In fact, the mouth of Chesapeake Bay has interest enough in itself, irrespective of the Exposition, to make it an attractive terminus of a summer trip.

THE OLD CHURCH TOWER ON JAMESTOWN ISLAND.
The site of the first permanent English settlement in America.

"Where are you going?"

"Norfolk."

"What are you going there for?"

"To get my ticket validated."

This dialog, overheard on the cars, reveals the motive of many tourists, and there is no fault to be found with it. Norfolk is a good point to have one's ticket validated. Most of our population live inland, and to them the steamboat trips up the rivers and across to Old Point Comfort and

thru the fleet of battleships are novel adventures. Then there are bathing beaches; still water at Ocean View and surf at Virginia Beach, the water as pleasantly warmed as a

THE LIGHTHOUSES AND SAND DUNES OF CAPE HENRY.

well-tipped bath steward could fix it. Here one can study to the best advantage the history of our three great wars. He can take a trip to Yorktown to assist at the surrender of Lord Cornwallis. He can follow the British ships as they sailed up the Potomac in 1814 to burn our national capital, and when he goes up the James to Richmond he will pass between the bloodiest battlegrounds in America; on his right the scene of the peninsular campaign, checked by the Seven Days' Battle, and on his left Petersburg, captured by the nine months' siege.

But, of course, the spotlight is now turned on the three small ships under Captain Christopher Newport that were driven by the storm into the mouth of Chesapeake Bay three hundred years ago. On board were the colonists, a queer assortment—54 gentlemen, and 28 carpenters and laborers, "with divers others to the number of 100." The most capable man among them was a prisoner, so held, as he tells us, "upon the scandalous suggestions of some of the chiefe (envying his repute), who fained he intended to usurpe the government, murther the Councell, and make himselfe King." He was a

> "Youngster of excellent pith, 'Fate tried to conceal him by naming him Smith.' "

A trolley ride of an hour from Norfolk thru the pine woods, swamps and white sand dunes brings one to the scene of the first landing, which was not calculated to impress the Indians with the military prowess of the invaders.

> "The first land they made they called Cape Henry, where thirtie of them recreating themselves on shore, were assaulted by five Salvages, who hurt two of the English very dangerously."

On Cape Henry there are two lighthouses; one a lighthouse *emeritus,* built in 1791, and a new one of steel, throwing a red and white light across the bay-mouth to the cape of the brother prince, Charles. Tourists are always pleasantly surprised to find that these capes are real places and made out of common earth. One naturally gets the impression that they exist only in geographies, like the Tropic of Cancer and the Arctic Circle.

John Smith has been much criticised this summer because he did not locate Jamestown nearer the Exposition grounds. But such disregard of the convenience and feelings of admiring posterity is a common failing of historic personages. It takes a full day out of one's limited ticket to go by steamboat up the James to the island, 52 miles. But then San Salvador was farther than that from Chicago. A patriotic shrine requires a pilgrimage to make it properly impressive, and so Jamestown Island gains by its location. It is fortunately left in a primitive condition. The population is less than it was three hundred years ago. In fact, it is hardly correct to speak of it as the site of "the first permanent English settlement in the New World," for it was abandoned for two hundred years. The antiquarian revival has now disinterred tombs, traced foundations and built a church behind the tower which is all that remains of the old structure. Here English aristoc-

racy was united with American royalty, and the Princess Pocahontas became the Lady Rebecca; one of the eight most important events in American history, if we may judge by its occupying a panel in the rotunda of the Capitol at Washington, between the Signing of the Declaration and the Discovery of the Mississippi. In those days race lines were not drawn so closely as they are now in Virginia. The Pamaunkee Indians, all that are left of Powhatan's tribe, still intermarry with the whites, but they draw the line at a darker color. No negro is allowed to remain on their reservation longer than thirty days.

A band of these Pamaunkees on the Warpath—the modern, peaceful Warpath—nightly re-enact the historic and legendary deeds of their ancestors. As

CAPTAIN JOHN SMITH TRADING WITH THE INDIANS.
Group in the Smithsonian Building.

they have not had the advantage of college training, their war whoops are deficient in animation and abandon, but they have brought with them from their reservation the genuine original stone on

which Captain Smith did or did not lay his head when he was or was not rescued by Pocahontas. It is at least as authentic as the Blarney Stone that was kissed by thousands of would-be flatterers at the Chicago Exposition.

The skeptical spirit is destructive of all patriotic sentiment. To get the most out of Jamestown one must be endowed with unquestioning and reverent faith. Without this he would fail to be properly impressed when he stands before the boots in which Thomas Jefferson signed the Declaration of Independence or gazes on the gold plate that marks the spot on the Richmond bar where General Lafayette set down, bottom side up, the glass which had contained his first mint julep. There is no branch of industry in which it is more true that the demand creates the supply than in this business of relic-mongering, and of late years, owing to the influence of hereditary patriotism, the demand has been brisk. "Graves have yawned and given

RICHMOND BLUES ON PARADE, VIRGINIA DAY, JUNE 12.

up their dead." Fortunately it does not make a particle of difference whether relics are authentic or not. Those who are susceptible to such telluric currents get the same thrill when they stand on the erroneously identified site of an imaginary event as they do on the real spot where something did happen. The history of hagiography proves that pseudo-saints work just as many miracles as true ones. Tho the bones of a martyr multiply like the loaves and fishes they never lose their power. No doubt the same holds true for patriotic relics. It is to be hoped so.

The United States Government has contributed a large and, in my opinion, disproportionate amount of money to the Jamestown Exposition. According to the official report the national appropriations are as follows:

GOVERNMENT APPROPRIATIONS FOR EXPOSITION.

Buildings for Alaska, Hawaii, Porto Rico and the Philippines	$200,000
Building for United States Government, Government exhibits, including Life Saving Service and Bureau of Fisheries	250,000
Building for rendezvous for the soldiers and sailors of the United States Army and Navy and foreign armies and navies at the Exposition	$75,000
Building for the commissioned officers of the Army and Navy of the United States and foreign countries	50,000
Two Grand Piers extending from the Exposition grounds into the waters of Hampton Roads with towers for lighthouses and wireless telegraphy	400,000
For transportation of United States, State and foreign troops to and from the Exposition	100,000
For general Exposition purposes	250,000
For a permanent landing pier at Jamestown Island	15,000
Improvements on Jamestown Island	10,000
Negro Building and exhibit at Exposition	100,000
Expenditures for Jamestown Exposition Commission, consisting of the Secretary of the Treasury, Secretary of War and Secretary of the Navy	50,000
Official entertainment of foreign military and naval officers at Exposition	125,000
For monument on spot where first permanent English settlement in America was made	50,000
For permanent moorings in Hampton Roads	15,000

For reproduction of battle of Monitor and Merrimac at Hampton Roads	$10,000
Dredging off Government Pier	65,000
Loan to the Exposition Company	1,000,000
Total	$2,765,000

The twenty-five States participating in the Exposition have spent in buildings and exhibits $1,992,000, the largest appropriations being $350,000 by Virginia, $150,000 by New York, and $100,000 by Pennsylvania. The Exposition Company itself raised thru subscription to bonds "approximately $1,000,000," as it is given in the official report. How much was actually paid in is not stated. According to a report given out to the newspapers July 1st, the common stock issued amounted to $450,000, on which the subscribers paid 28 per cent. To meet the present stringency a committee of twenty directors has been appointed to wait on the stockholders and collect the 72 per cent. still due.

The million dollars loaned by the Government is said to be "secured" by a lien upon 40 per cent. of the gate receipts, but unless the attendance multiplies rapidly during the remaining four months and a half only a small part of it will be repaid. At the present rate of attendance of 5,000 a day or less the Exposition would have to run about three years in order to pay back the loan. The Exposition authorities estimated that 5,000,000 people would visit the Exposition and would leave about $125,000,000 in Norfolk and vicinity.

It is to be hoped that no more loans will be made by the national Government to expositions. If the security is good the money can be obtained from other sources. If it is not, the Government money should not be risked. All desirable assistance can be given in other ways. Without the loan the Government has done enough for Jamestown. The army and navy have been the most widely advertised features of the fair, and the Government buildings contain the best part of the exhibits. Most of these have, of course, been seen at other expositions, but they have been improved from year to year, until now they are

THE NEW YORK STATE BUILDING AT THE JAMESTOWN EXPOSITION.

admirably adapted to their purpose of showing at a glance just what public service the various departments are performing. They are seen by more people than read the annual reports. After the tourist has stuck his head into the mouth of the 16-inch gun and noted the accuracy with which the West Point cadet arranges his tooth brushes, he feels a sense of security against foreign invasion. And when he has seen how money is made, how fishes are hatched, how mail is delivered and how food is tested, his respect for Uncle Sam's ability and usefulness is materially increased. He can listen to biograph lectures on his native land, and get the historical knowledge he needs for the occasion by going thru the exhibits of the Library of Congress and the Smithsonian Institution. The latter has gone a step beyond anything that has been previously attempted in our new American art of museum sculpture. The center of the building is occupied by a large group of Jamestown colonists trading with Indians, including a feeling representation of the effect of the first persimmon. That these Government buildings were completed and the exhibits installed in time for the opening is equally remarkable and commendable.

Not so much can be said for some of the other Government expenditures. The negro building is hardly yet ready for visitors, the monument on Jamestown Island is still flat on the ground, the fuel testing plant is not ready for work, and the piers and basin are not completed. The two undertakings last mentioned are of questionable value. Why should the Government bring trainloads of heavy machinery from St. Louis and set up on permanent foundations three boilers of 250 horsepower each, two gas producers and a gas engine of the same capacity, and three briquetting machines, for the purpose of testing coal on the exposition grounds for three months? This department of the United States Geological Survey work is of great importance and

THE PIERS BEING CONSTRUCTED BY THE GOVERNMENT.

the public ought to be better informed about it, but an extensive plant like this for scientific experiment should be placed on Government land, where it can remain permanently. And why should the Government construct, at the Exposition grounds, two permanent piers 200 feet wide and 1,600 feet long, and dredge out a basin 800 feet wide between them, at a cost of $465,000? Is it solely for the purpose of providing a place for water sports during the last few months of the Exposition? If so, it is a waste of public money. And, while we are asking questions, why are all the State and many of the other buildings constructed as tho they were intended to last to the Quadri-Centennial? Why is permanence regarded as a desirable thing in exposition architecture? Their purpose is but temporary; they are on ground owned by the Exposition Company, and must soon be torn down or sold for other purposes, while the money that has been spent on them would have gone much farther if expended in attractive exhibits. There are many answers afloat to these questions, but none of them appear to have enough authenticity to be worth repeating.

New York City.

Abd-Ul-Hamid and After

[The following article is by one of the best informed living students of Turkish affairs and a resident of Constantinople. For obvious reasons he cannot sign his name.—Editor.]

IF one can believe the European doctors who were in attendance upon him, the Sultan has now completely recovered from his serious illness. In Constantinople their statements are regarded with considerable scepticism, and in any case there is plenty of evidence to show that Abd-ul-Hamid is no longer the man he was a year ago. He has ceased to attend to business with the unwearying assiduity which was one of his main characteristics, and he has lost the keenness and quickness with which he used to impress foreign diplomatists in his conversation. He may have recovered from his illness, but it has left him tired and aged; and the prevailing opinion is that he cannot last for many months. Speculation is universal as to the date of his death, and among Christians and Mussulmans alike there is a general feeling of relief that the detested Hamidian régime is drawing to an end.

His unfortunate subjects hope that things will be better under his successor. They can hardly be worse, it is true, but it is difficult to discover any solid ground for taking a cheerful view of the future of Turkey. The character of the ruling classes has been so completely demoralized during Abd-ul-Hamid's long reign that it would be next to impossible to find the men able and willing to introduce and to carry out the drastic reforms which would be needed to give the country a new lease of life. Every one who knows the Turks of the official class is agreed that the present generation is more corrupt, less patriotic and weaker in character than the last. One of the most experienced diplomatists in Constantinople has described official life in Turkey during the last twenty or thirty years as a struggle for existence, in which those have survived who were the least embarrassed with scruples of honesty or public spirit. According to him and others there has been a steady deterioration in the character of men in office. The cause for this is to be found in the policy of the Sultan. Abd-ul-Hamid, when he came to the throne, found the Porte all powerful. His predecessors, Abd-ul-Aziz and Abd-ul-Medjid, had only enjoyed the shadow of power; the actual government of the country had been in the hands of viziers and ministers, among whom Midhat Pasha and Fuad Pasha were the most prominent at the time of his accession. He resolved to free himself from this tutelage and make himself absolute. For a time he

played with the ministers who had put him on the throne, even going to the length of promulgating a constitution drawn up by Midhat Pasha. But he got rid of them one by one, and filled the offices of state with creatures of his own. Midhat Pasha, whom he feared the most, was, after some years of fancied security, exiled to Arabia and there murdered. The Porte, the responsible government of the country, became a mere machine for carrying out the Imperial will. The Sultan's passion for undivided power went so far as to make him intolerant of any influence which, in however slight a degree, might impose a check on his arbitrary rule. The possession of popularity, of character, or of ability, at once rendered an official suspect. A reputation for liberal opinions was fatal. Knowing the character of the men whom he employed to govern the country, and perpetually suspicious of plots against himself, he maintained a whole army of spies, and turned a ready ear to the tales of his officials, who were only too ready to tell one against the other. A reign of terror was established, and a race of informers and blackmailers has grown up, who are today the curse of the country. To what length these men will go, and what influence their stories exercise over the morbidly suspicious and credulous Sultan, is shown by the authentic story of Djavid Bey. This man, who was one of the most successful blackmailers in Constantinople, had been refused money which he had demanded from the Quay Company. In revenge he wrote a report to the Sultan, stating that the company was taking large quantities of stone from the island of Proti, one of the islands in the Sea of Marmora, and was thus interfering so seriously with the equilibrium of the group as to put them all in danger of being submerged. This extraordinary story produced its intended effect, and orders were sent from the Palace forbidding the Quay Company to take any more stone from the island.

No one has any illusions as to the character of the vast majority of officials, least of all as to that of the high functionaries at the Palace and the Porte. In most cases they are men of low origin, who have been brought to the front by their capacity for intrigue, and who have accumulated large fortunes by taking bribes and pilfering public money. But, curiously enough, there is a widespread impression that both the Grand Vizier and the Sheikh-ul-Islam are exceptions to this general rule, that they are patriotic and enlightened statesmen, and that tho, under the present Sultan, they are powerless to fight against abuses, they will do their best to induce his successor to follow a more liberal policy. This is, of course, merely an impression; and, tho both the Grand Vizier and the Sheikh-ul-Islam have occasionally ventured to oppose the Palace, there is nothing to show that they possess the qualities necessary to enable them to play the part of saviours of their country. The Grand Vizier is compromised in the eyes of his countrymen by having for so long acquiesced in the evils of the present system, and would not find it an easy task to regain public confidence.

Much, of course, will depend on the character of the next Sultan. The heir-apparent is Reshad Effendi, one of Abd-ul-Hamid's brothers, and, in spite of all the rumors to the contrary, there is little doubt that he will succeed. The Sultan is credited with the intention of changing the order of succession, and of nominating his favorite son, Burhan-ed-Din, to the throne. Burhan-ed-Din is a long way down in the order of seniority, and there are no less than thirteen princes between him and the succession. The Palace favorites might be glad to see him ascend the throne, in the hope that they would be able to maintain their position under a young man of twenty-one who has been educated more or less under their influence. For this very reason, however, he would be unpopular with the people, who ardently desire a change of *régime*, and who would object very strongly to the violation of the law involved in passing over the other thirteen candidates, two of whom are his elder brothers. If any of the princes with prior claims to the throne chose to resist the usurpation, they would find considerable support in Turkey. Moreover, Burhan-ed-Din would find it difficult to get himself recognized as Sultan by the Powers, and his position, both at home and abroad, would be most irregular.

The obstacles in the way of his succession are so many and so obvious that it is impossible to take his candidature as serious. Reshad's only dangerous rival is his cousin, Youssouf Izz-ed-Din, who, in accordance with the Ottoman law of succession by seniority, is the second heir to the throne. Reshad's ill health and reputed mental weakness might conceivably be made the pretext for passing over his claim, or for deposing him shortly after his accession. From Youssouf Izz-ed-Din it would be hopeless to expect reforms. All accounts agree in describing him as a man of narrow views and despotic temper, who would continue the Hamidian policy of suppressing every other initiative in the country except his own. The present set of Palace favorites would probably be swept away, but their places would be taken by others, who would be just as unscrupulous, and, by reason of their present poverty, even more rapacious.

It is not quite so certain what the result will be if, as is more probable, the throne comes to the heir-apparent, Reshad Effendi. The reports of his liberalism are possibly exaggerated. But he is a weak man physically, and probably mentally as well. Those who believe in the patriotism of the Grand Vizier and the Sheikh-ul-Islam hope that they will still be in office when he becomes Sultan, and that they will be able, if not to revive the constitution, which was granted by Abd-ul-Hamid, but afterward suspended, at any rate to restore the Porte to some of its former importance. Reshad's weakness, they think, will facilitate this task, even if he, who has suffered almost as much as any one from his brother's despotism, is not in sympathy with the aims imputed to the Grand Vizier and the Sheikh-ul-Islam. His entourage will, however, be the cause of great difficulty. His servants and dependents look forward to the time when they can become Imperial secretaries and court chamberlains, and enjoy the opportunities of which the Izzets and Faiks make such ample use under Abd-ul-Hamid. Their object, there can be little doubt, will be to get as much power as possible into their own hands, which, of course, will mean maintaining the present supremacy of the Palace over the Porte and all the abuses to which this supremacy has given rise. As they have shared Reshad's fortunes while he has been a virtual prisoner in the hands of his brother, it is to be expected that they will exercise greater influence than men who, whatever their private feelings may be, are now serving under Abd-ul-Hamid, and are, as ministers, carrying out his policy. So that even the succession of the reputedly liberal heir-apparent is more likely to be followed by a change of personnel than by a change of system.

That the Powers should interfere and bring pressure to bear in favor of reforms is most unlikely. In Turkey, more perhaps, than in any other part of the world, their mutual jealousies and suspicions make effective co-operation impossible; and more than one of them will be unwilling to join in any action which would make Turkey stronger to resist aggression.

There can be little hope of any real improvement until there is a strong movement among the people themselves in favor of good government. There have lately been signs that such a movement is not quite so impossible as is generally believed. The discontent of the Armenians and other Christian races is sufficiently notorious, as are the liberal aspirations of the educated Turks. The recent risings in Kastamouni and Erzeroum, where the Turkish population demanded and obtained the dismissal of corrupt officials and the remission of oppressive taxes, show that discontent is far more widespread than any one supposed. The significance of these risings is increased by the fact that the troops refused to act against the people. But tho these are favorable symptoms, it would be a mistake to attach too much importance to them, in view of the ignorance of the peasantry and the apathy and corruption of the educated classes.

CONSTANTINOPLE, TURKEY.

On the Train

BY ELIZABETH BOYLE O'REILLY

LITTLE brooks of running song over pebbles flow.
I'm returning to my Love, swift! oh swifter go!
Chill the winter, yet I feel spring in every breath.
Hark! the runlets headlong reel! Springtime looseneth
All the streamlets, tumbling, mad, rushing down the hills,
Buoyant, gurgling, rippling, glad—harken to the rills!
Scatter, gather, onward press, faster, wilder glee!
Frolic, flashing, gleaming stress, on to join the sea!

Little brooks of running song over pebbles flow.
I'm returning to my Love, swift! oh swifter go!
Joyous, eager, trembling sheer, breathless back I come.
Patience! but an hour so near, bear the fret and hum!
Are you waiting? Are you sad I've been absent long?
All my heart is singing glad, little brooks of song.

MILTON, MASS.

One Woman's Question

BY REBECCA HARDING DAVIS

DID you ever notice a shrewd farmer as he goes over his fields, how he takes account of every trifling sign to find out their condition? Here he picks up a bit of earth and smells it and tastes it; there he notes a new kind of weed that is making headway; these trees are puny and diseased, those are rank with lichen. The wind thru that newly cut gap is killing the young corn, the manure is too strong for these peas, etc., etc. He finds the remedy for each thing or he is no farmer.

I was out of this country lately for a short time, and when I came back I noticed certain suggestive small changes in it to which the governing American seems to be blind.

For, after all, there is an American to whom the country does belong and who is responsible for it to the unknown Power who made it and him. This American has opened his gates to all sorts and conditions of men, and just now is so occupied by their foreign creeds and doings that there is danger that he will forget that the country, after all, is his possession, a farm loaned to him for a while, and that he must render account some day of the crops it bears to its owner.

May I tell you of one or two of the little incidents which the daily papers have reported, and which show the diseases that are gaining ground in this country, just as the sour earth and fungus indicate the ailments of the worn out farmer?

No. 1. A few weeks ago a workingman in Philadelphia, being jealous of the girl—a young saleswoman—to whom he was engaged, fired at her, and, missing her, blew out his own brains. His blood bespattered her gown. She was called to give her evidence before the Coroner. When she had told her story, she approached that official with an ingratiating smile.

"Could I have the pistol?" she said.

"What do you want with the pistol?" he asked gruffly.

"As a souvenir of a most painful and

dramatic occurrence!" she replied, simpering. "Why, I suppose that my picture will be in the papers tomorrow."

No. 2. This girl earned her living in a large department store. An inquiry was recently made as to the kind of books taken out of the free library during two months by the women employed in this establishment. Three per cent. of these books were history, 1 per cent. travels and essays, the remaining 96 per cent. were fiction, usually of the flimsiest character, many of the books depending for their interest on divorces and unusual erotic, putrid subjects.

No. 3. An energetic philanthropist lately addressed a note to each of the women engaged in another large department store asking whether if they should marry and give up work they would prefer to board or keep house. Out of the six hundred women addressed only eleven preferred homes of their own to the freedom of a boarding house. One of them, apparently, spoke for her class when she said: "After I have shared the public life of a great store, why should I shut myself up in a kitchen to cook bacon and hot cakes for one man?"

No. 4. Almost every railway in the country is fenced on both sides by huge boardings, representing gigantic cows, pigs and other beasts, advertisements of dealers in drugs, whiskey, shoes or trousers. Behind these hideous bids for money lie tranquil valleys, landscapes as fair as any that Claude painted, and sometimes vast ranges of mountains, full of the peace of God. The sight of all this immeasurable beauty is hidden from the travelers who pass thru the country, in order that a few dealers may sell more tobacco or whiskey. No one protests. Trade apparently is more valuable than beauty to the average American.

No. 5. The contractors for the Capitol of Harrisburgh have just brought in an additional charge of $650,000 for the air furnished in that building.

No. 6. Three passenger trains on the Pennsylvania Railroad lately were derailed within a week by Italian strikers, who wanted more wages. They were not punished.

No. 7. Zito, an Italian in New York, killed his wife and mother-in-law the other day, and proceeded to cut them up. When he perceived that his baby boy was watching him, he took the child up, dripping with blood as he was.

"Promise," he said, "that you will not tell what you saw." The child promised. "Swear it." The child swore. When the police came he was dumb and has not yet been brought to accuse his father.

No. 8. The headless body of an Italian was found on the railway near Trenton, with the head lying at some distance.

It is true these things were done by Italians, not by our own people. But it is also true that Italians do not cut up their wives, nor derail trains, nor chop heads from bodies and leave them lying loose about the streets—in Italy.

No. 9. The Thaw trial, with all the *dramatis personae,* prisoner, witnesses, lawyers, reporters and the papers who gave it to the world. What is the meaning of that putrid sore in the life of the country?

No. 10. Several of the newspapers which cater for the most intelligent readers in the country, publish weekly the novels which rank highest in English literature condensed into a single page. "Waverly," "The Newcomes," "Jane Eyre," and other masterpieces of Scott, Thackeray and Dickens, have been thus boiled down to suit the times, and the taste and capacity of American readers. It is akin to offering a picture of Niagara on a two-inch square tintype.

Gigantic crimes, such as we have found lately in the doings of Pennsylvania politicians, of negro-phobists, or the Orchards and Adamses are to the country like huge conflagrations, whose size and fury drive men to make haste to repair the damage they have done.

But the little instances which I have given you of a growing vulgarity, dishonesty and vice in the country are the symptoms of a creeping paralysis which threatens us almost unnoticed.

What is its cure?

PHILADELPHIA PA.

Henry VIII.

THE OXFORD HISTORICAL PAGEANT

by CLARENCE WINTHROP BOWEN, PH.D.

Elizabeth.

ALL England is interested in what is taking place this week at Oxford University. Commemoration Day was yesterday, when honorary degrees were given to Whitelaw Reid, the United States Ambassador, and to Samuel Langhorne Clemens, better known as Mark Twain, and to the Prime Minister, the Lord High Chancellor of Great Britain, the Speaker of the House of Commons, the Lord Chief Justice of England and to many others, including Sir Norman Lockyer, Sir William Ramsay, Professor Sayce, Rudyard Kipling, and General Booth, the Commander-in-Chief of the Salvation Army. It was a notable gathering, and the new Chancellor who presided, Lord Curzon, was a notable figure. Sheldonian Theater, where the degrees were given, never con-

THE DEPARTURE OF FRIDESWIDE.

tained a more distinguished audience, not even when honorary degrees were given fifty-five years ago to Lord Macaulay and to Alfred Tennyson. When Tennyson received his degree an undergraduate in the gallery called out: "Why don't you cut off some of your hair?" and yesterday, when Mark Twain, the hero of the day, stepped forward to hear from Lord Curzon the Latin sentence beginning with the words, *"Vir jucundissime, lepidissime, facetissime,"* etc. (each word was received with enthusiastic cheering), some one called out: "Get you hair cut, Mark. Don't rob the barber!"

And today it seemed as if all England was present to attend the opening of the Oxford Historical Pageant.

It was the most elaborate succession of gorgeous scenes ever put upon an out-of-door stage. The Pageant consisted of sixteen parts, ten being dramatic scenes, for which the words were written by members of the university, and six simply spectacular. Several thousand actors took part. The theater of operations was an ideal one on the banks of the Cherwell, near the Broad Walk. Stretching away from the new bridge is a long sloping stretch of turf fringed with trees, which affords a splendid approach for cavalcades or panoplied processions, which one can see emerging from the greenwood at a great distance. Here and there among the trees one would catch a glimpse of a battlemented gateway or a castellated tower, all very realistic, and setting off to perfection the scenes enacted in the foreground.

These are scenes in the history of the university, beginning with the first legend of the founding of Oxford in the eighth century. It is a peaceful scene, shepherds and fishermen, when a hurried boat is seen rowing down the river filled with women. It is St. Frideswide, accompanied by her maidens, who is fleeing from Algar, who has resolved to seize her by force. The shepherds care for her, until Algar's boat comes with armed men, who land and seize the maiden, when, in answer to her prayers, a flash of lightning blinds him. He falls on his knees and begs Frideswide to pray for him. His sight is restored, and he vows a convent on the spot for the maiden princess, who becomes the abbess, and the scene closes with her and

STATE PROGRESS OF QUEEN ELIZABETH.

HENRY VIII AND CARDINAL WOLSEY.

her nuns prophesying the future greatness of the place, where will, in future times,

> "by these streams,
> Old men see visions
> And young men dream dreams."

Then follows the coronation of Harold Harefoot, A.D., 1036; then the beginning of the University about 1010 A.D., when Theobaldus Stampensis started a school with a band of poor scholars, a humbler beginning than that of many an American college. Then follows the scene of Henry II and the fair and frail Rosamund, who became a nun when she left Henry, and the king gave Oxford its charter. In succeeding scenes we see Friar Bacon, Henry VIII, Queen Elizabeth, Shakespeare, James I and his Queen, the happier days of Charles I, the surrender of Oxford to the Puritan soldiers, the expulsion of the fellows of Magdalen by James II, and a later scene in the eighteenth century, a realistic sketch of St. Giles's Fair, to visit which George III comes down the river in his royal barge.

Between the sixth and seventh episodes was an interlude most admirably depicting a masque, or play, called the "Masque of the Medieval Curriculum." This was written by Prof. Walter Raleigh. In this the Wise and the Vain Student make their several choices between Divinity, Medicine, Law, on the one side, and Folly and Pleasure on the other. It was most realistically and yet poetically treated.

All these gorgeous scenes were accompanied with music, from the simplest measures of the early shepherd's times to Haydn's Oxford Symphony, which he wrote for his visit to the city. The music is published, also a book of the words, and a delightful Souvenir of the Pageant, giving its various scenes. From these the present illustrations are reduced.

The greatest credit is due to those who have taken the leading part in its composition, and especially to Mr. Frank Lascelles, the organizer and producer of the Pageant, who is himself an Oxford man, and who has been for six years, since leaving Oxford, devoted to the stage.

I am not surprised that Mark Twain has declared this to be the greatest and most beautiful scenic display ever produced; and in this he has the agreement of all who have seen it.

OXFORD UNIVERSITY, ENGLAND, June 27, 1907.

Was It in June?

BY CHESTER FIRKINS

WAS it in June that first we dreamed
  Still in the garden's evening glow,
  And watched the red cloud-pennons blow
Where Sunset's seaward galleons gleamed?
Was it in June my Heaven seemed
  Only the kingdom of your eyes,
And Earth with all Love's guerdon teemed—
  Was it in June—or Paradise?

Was it in June—that summer day,
  When riverward, thru filmy sheen
  Of woodlands warm with early green,
We took the blossom-haunted way,
Like blithesome nymph and lissome fay,
  And, drifting, in that sweet surmise
So yesfully you said me nay?
  Aye, it was June—*and* Paradise!

NEW YORK CITY.

Speech and Habits of Wild Animals

BY R. L. GARNER

[It is well known that Mr. Garner has spent much of his time for a number of years in the forests of Africa, studying the language of monkeys and other animals.—EDITOR.]

IT is not with any desire to enter into a controversy upon the subject nor in any wise to impugn the authority of others that I am prompted to submit this brief statement of my experience with wild animals; but having devoted many years to the special study of wild life and spent much of that time in the native haunts of the animals studied, I believe myself competent to testify upon certain points concerning them.

In the ordinary course of things I should prefer to have reserved the facts here given and related them in their proper place and order in a more complete account of my observations along this particular line; but I am induced to make this departure from such a plan by having recently read an article on "The Language of Animals," by Mr. William T. Hornaday, whose wide experience should amply qualify him to speak with much certainty concerning the habits of animals, and whose responsible position gives his statements the force of authority. The highest authorities, however, are not always infallible, and as every individual who commits himself to public print thereby assumes the rôle of a public teacher, his *data* are subject to public censorship.

The student of animal life, whose observations are confined to specimens in captivity, necessarily fails to learn many of the natural habits of the species so studied.

The only way in which any one can learn, at first hand, the innate habits of any species is to live among them in a state of nature, and for an indefinite length of time clandestinely study them without in any manner disturbing them. Merely camping in a forest, with a caravan and bonfires, affords no opportunity for a methodic study of its denizens. Of course any one may incidentally observe certain isolated facts without resorting to any special method of study, as trappers and hunters observe such facts as aid them in the pursuit and capture of game; but, as a rule, they are incoherent facts and constitute but a small part of the life history of a species.

Mr. Hornaday begins by stating that *in the jungle one hears but very few vocal sounds of animals,* and continues, that,

During countless generations the noisiest animals have been sought out and killed by their enemies and only the more silent species survive; that,

Excepting the song birds, the wild creatures of today have learned by instinct and experience that silence promotes peace and long life; that,

During years of nominal security domestic fowls have developed a creditable vocabulary of calls and language cries; that,

During many weeks of hunting in a forest teeming with big game and monkeys, only about eight times he ever heard the voices of animals in communication with one another.

The article affords many other texts upon which long chapters of commentaries might be written; but the few extracts here cited are more than sufficient for the present purpose, and recall to my mind so many hundreds of counter instances that it would be tedious to recount a tithe of them.

That wild animals are habitually more taciturn than domesticated ones of kindred races there is no doubt; and the same is equally true of the wild tribes of mankind; but the fact is more probably due to a lack of social intimacy, nomadic habits and similar causes than to discretion as a measure of safety; and such are their inherent, rather than acquired, habits. Social intercourse naturally promotes the development of the linguistic faculties, and even in a wild state it is not difficult to see that those species which manifest the strongest social tendencies have more copious vocabularies and more lingual phonetics than those species of more exclusive habits have. The novice who goes into the jungle ex-

pecting to hear a continuous hum of animal voices will no doubt be disappointed, and there are times when its silence is almost oppressive; but it is not always so, as will be shown farther on.

It is quite certain that, during the long period of their domestication and their more intimate association among themselves, most, if not all, domestic races have developed new elements of speech; but they are only variations of the fundamental sounds peculiar to their ancestral species. They are developments of, but not additions to, their inherent speech. Altho many domestic animals are able, in some measure, to interpret human speech and that of other species, they make no voluntary effort to imitate them or to adopt any of their phonetics; but the fact that, living under more favorable social conditions than wild animals enjoy, domestic animals have learned to talk more than their wild kindred do does not prove nor imply that the latter have learned to be more silent than their predecessors have been for ages.

Theoretically it seems plausible that silence would conduce to the safety of animals roaming about in the forest, and I have often wondered that they were not more circumspect about uttering their sounds; but a better knowledge of the habits and faculties of wild animals convinces me that such precaution is quite useless and that their voices are seldom, if ever, a source of danger to them from any enemy except man; and in the real drama of jungle life he plays a very insignificant part.

In solving the problem of survival in the jungle *cosmos* it is difficult to say with certainty what are the most active agencies of destruction to animal life; but it is obvious that the carnivores constitute one of them, and certainly they are the only natural enemies to which other animals have any cause of fear of betrayal by the sounds of their voices. Those enemies, however, do not rely upon such means of finding their prey; they depend almost wholly, if not quite so, upon their keen sense of smell, which is vastly more acute than that of other animals, and is, perhaps, the most active of all their faculties. Every species of animal in the forest has its own peculiar odor, as distinct from that of other animals as its form and color are; and under fair conditions even the native hunters often detect the presence of certain animals by that means alone. Many of the natives who are not adepts in woodscrafts readily detect the scent of the more dangerous animals. Three times in a single day my guide in the Esyira forest announced the proximity of gorillas and once of a leopard, and in each instance proved to be correct; yet the most sensitive of human olfactories are feeble and obtuse as compared to those of wild animals.

Practically all the carnivores are of nocturnal habit and chiefly seek their prey at night; they do not prey upon each other, but live upon the vegetarian and omnivorous species, most of which are of diurnal habits, and many of them are seized while asleep. Their silence affords them no immunity from such enemies and the enemies do not need such means of betrayal to find their victims. The instances in which the voices of animals have fatally betrayed them to any other enemy than man are undoubtedly very rare.

It is true that man, to a great extent, depends upon his ears to find his game and often the voice of an animal guides the hunter to him; but the percentage of such cases is not large, and when the number of such instances is compared to the whole number of fatalities it is quite insignificant. No species of animal, as a whole, seems to have ever learned that such are the means of their betrayal, and it would be difficult to prove that any individual animal ever suspected it. Certainly animals that are much hunted by man soon recognize in him a dangerous enemy and some of them evidently associate the report of a gun with his methods; but it is exceedingly doubtful if the most sagacious of animals ever attributed his presence to the sound of its own voice. Of all the causes of alarm to which wild animals are liable, sounds appear to give them the least anxiety, and of all other sounds, except whistling, vocal sounds attract their attention the least.

It is a singular fact, and here quite relevant, that the species of animals which have the fewest reasons to fear betrayal by their voices are, by nature, the most silent ones; and in this respect the carnivores themselves, who have the

fewest deadly enemies to fear, may be ranked first, while birds and omnivores, who are their most helpless prey, are, by nature, the most loquacious ones.

For the present we turn from generalities to specific details. As the simians are my special subject of study I shall treat them first, and the chimpanzee being the central figure of my group, I shall start with him.

Altho the chimpanzee has never been accused of being a garrulous species, he is very far from being one of the silent members of the animal kingdom. During my first three voyages to this country I seldom heard the wild ones talking in the forest; but during my present sojourn of nearly three years I have been surprised at the frequency with which I hear them. Sitting here in my house or strolling about my small premises, I often hear them in the adjacent forest, and not only do I hear them, but any number of times I have stood by my door and exchanged calls with them until I tired of the diversion. Several times when the forest was as quiet as a picture I have heard them suddenly begin talking, sometimes in most emphatic tones and at others in subdued and gentle ones. It is not continuous like human conversation, but periodical and brief.

Not only does the chimpanzee often break the silence of the forest when all other voices are hushed, but he frequently answers the sounds of other animals, as if in mockery or defiance. It is not in imitation of their sounds, but in immediate response. He seems to find pleasure in answering the bellowing of the crocodile, the scream of the peacock, the yowl of the mangaby and similar cries. In fact, almost any loud shouting sound inspires him to a series of vocal gymnastics.

Altho diurnal in habit, the chimpanzees often make the night reverberate with the sounds of their terrific screaming, which I have known them to continue at times for more than an hour with scarcely a moment's pause—not one voice, but many; and within the area of a square mile or so I have distinguished as many as seven alternating, adult voices engaged. So far I have not been able to interpret those strange, nocturnal cries, as I have no means of seeing the conduct of the animal while making them; but they appear to be of an amicable nature and not expressive of fear or anger. I have sometimes suspected they were intended to ward off intruders, but I have no means of verifying such a theory. It is very difficult to obtain a fair view of these apes in the bush, as they are always on the alert; but they appear to be utterly indifferent to being heard, either talking or moving about.

The chimpanzee is generally conceded to be the most genial and intelligent of all wild races and he is endowed with an innate, tho incipient, sense of humor; but it must be borne in mind that many incidents which amuse mankind do not appeal to the animal mind as being funny. Within the narrow scope of wild life there are but few incentives to mirth, and with so little to stimulate the risible faculties they are never highly developed in any wild species; but failing to provoke a chimpanzee to laugh audibly *by tickling it under the arm some fifty times* should not any more discourage the operator than failing to make it cry by telling it fifty times that its mother is dead.

From my acquaintance with the chimpanzee, both wild and in captivity, I regard him as rather a loquacious creature; and from the hundreds of times that I have heard him vociferously talking in the forest, I am persuaded that his experience has not convinced him that silence is a great virtue.

The limits of space here allotted preclude reviewing in detail the vocal powers and speech capacity of the chimpanzee or other species; but I cannot forego saying that a few casual observations of an ape in captivity and a few efforts to teach it to speak do not justify a final verdict as to its capabilities. All animals appear much more reticent in captivity than in freedom, and the higher types seem conscious of the futility of speech.

The gorilla is more silent and stoical than the chimpanzee, but he is far from being mute. He appears to be devoid of all risibility, but he is often very noisy. Altho diurnal in habit, he talks less frequently during the day than at night, but his silence is a natural concomitant of his stealth and cunning. There are times, however, when he ignores all danger of betraying his whereabouts or his

movements and gives vent to a deluge of speech. At night his screams and shouts are frequent and terrific. His enemies should have but little difficulty in locating him; but just what they do with him when they find him I am not able to state.

In the forest surrounding my present abode are troops and schools of monkeys of diverse species. Daily and sometimes hourly they can be heard talking among themselves. The mankaby and the *nictitans* are especially talkative, and, like the chimpanzee, frequently answer the cries of other animals. Times without number I have exchanged calls with them, altho my attempt to imitate their sounds is very poor. Both of these species have large vocabularies, and that of the *nictitans* is especially rich in tone and definite in meaning. In a former article I have mentioned, described and translated five or six of these sounds.

A small species whose technical name I canot give, but locally known as the *isengè*, is one of the most persistent in talking of all the simian family. Numbers of them live about my place and in the contiguous forest. Scarcely a day passes that they fail to pass, chattering like magpies, within a few steps of my door. They come, one at a time, within ten feet of my galley and steal the ripe bananas from my fruit rack. During the approach of the thief they are always silent, but the instant he seizes his booty and begins his retreat the whole school of them begin as tho applauding the act.

If space permitted and the matter were of sufficient interest I could relate scores of incidents in detail; but it is here sufficient to state that, in addition to those mentioned, the *cephas, mona* and other species found in this section are all persistent talkers and can be heard at almost any hour.

One species of the *arctocebus*, which is of rigid nocturnal habits and chiefly lives upon snails, slugs, beetles and insects, howls and screams by the hour, and scarcely a night passes without his being heard. So far I have only distinguished one sound they make, but that is sufficient to keep a nervous person awake for hours.

While the elephant is comparatively silent, he is not so from the fear of his speech betraying him, and in some localities with which I am familiar his trumpeting is a very common thing at night. The hippopotamus is a much more noisy animal, and his bellowing, both by day and by night, is a very common occurrence. The bush antelope nightly serenade me with their cornet sound, and I have heard as many as five at a time in as many different quarters, but all within the range of a rifle. The leopard is their chief enemy and night is the time when he walks abroad; but the antelopes seem to have no fear of their voices betraying them. The leopard also habitually gives utterance to a peculiar sound resembling a grunt more than a speech sound, and, strange to say, he does this while hunting for prey, the very time that one would expect him to be most silent. I have heard the natives say that the leopard lures the monkey within his reach by imitating the sounds of his voice; but I have found no proof of such a fact, and most evidence points to a denial of it.

And now we must consider the birds, who are the noisiest of all the animal kingdom. Unless we class as song birds the eagle, owl, hawk, peafowl, toucan, parrot, pigeon and a score of other musical monstrosities, we must conclude that there are many glaring exceptions to the rule that *excepting the song birds the wild creatures of today are silent.* As the noisiest member of the feathered tribe, I introduce the horn-bill toucan, whose screeching cries are almost unceasing and among the most discordant notes in the whole gamut of sound. Over hundreds of square miles of this country one can scarcely get out of hearing of this demoniac voice, and his main rival is the wild peafowl, whose voice is not so harsh, but quite as harrowing. They supply me with meat, and I kill one every day, but they are not near being exterminated. The candidate that makes a close run for second place in this carnival of discords is the gray parrot. From dawn till dark, and often thru the night, this industrious trio can be heard. They have but few solo parts in their repertoire.

The gray eagle periodically circles around over a section of forest, incessantly screaming for an hour at a time, and the hawk perches himself on some lofty tree and does likewise. The pigeon

is equally energetic, but his music is more endurable. The owl family holds a nightly reunion, in which a host of other nocturnal birds take part, and not one of the whole coterie can make as much music as tearing a rag does. And apropos to this state of facts I should ask in what respect is the song of a bird less liable to betray its author than the speech of one? The song birds have the same enemies as other birds have.

This list, both of birds and mammals, could be greatly enlarged, but this array of noisy creatures is sufficient to show that all of them are not exterminated; and, so far as I can see, there is no sign of their noise abating. I see no reason why it should abate. The faculty of speech is as much a part of the animal economy as nerves and muscles are, and in every species it is developed in a degree commensurate with its requirements of speech and is capable of expressing all that the animal is capable of thinking. No species develops an ornamental language and no species suppresses a necessary one. There are, no doubt, many individual cases in which an animal has had the intelligence and prudence to maintain silence at a critical moment; but no species has ever acquired the practice of habitual silence, either as a trait or a policy.

I am aware that we have much yet to learn about the modes of silent communication employed by wild animals and which still survive among domesticated races. There appears to be something more subtle than visible signs or gestures, and the lower we descend in the scale of life the more effective that agency appears to be. It seems to be a kind of telepathy which involves none of the organs of sensation and is equally available in light or darkness. I have tried in vain for years to find some tangible clue to it.

In general terms it may be stated that the carnivorous animals are habitually the most taciturn, have the lowest type of speech, the fewest phonetics, are the most uniformly nocturnal in habit and lead the most solitary lives of all land animals. They are almost wholly devoid of affection, always treacherous and the least amenable to kindness. They are alike indifferent to pain or pleasure, remonstrate by growling and express anger in snarls.

The herbivorous species have a higher type of speech, a wider vocal range, are less rigid in their habits, are less secretive and more gregarious. They are more tractable, less vicious, manifest more affection and a degree of appreciation of kindness. They usually express their anger in vocal undertones.

The omnivorous animals are the most loquacious, have the highest types of speech, the greatest vocal capacity, the largest number of phonetics, which are the best modulated, are the most uniformly diurnal in habit, have the highest social instincts and a deeper sense of family integrity than any others have. Their attachments are stronger, their sensibilities more acute, their phonetics more articulate and distinct, and express anger in whining or staccato vocal sounds.

The swine is not included in the third division. Altho he may be regarded as omnivorous, he is a mere scavenger and an anomaly in all these divisions. The group here given do not include amphibious or aquatic animals, birds, rodents and reptiles.

In conclusion, I may say that the student of animal speech who will go quietly into the forest and patiently wait for a time, will be amply rewarded by the sounds of animal voices; but he cannot reasonably expect the animals to turn out with set speeches for the occasion of his visit. If I could only master the sounds I hear in the jungle with as little difficulty as I can hear them, I should, long since, have been an adept in animal speech. Altho my progress has been slow and the output of my efforts small, I am steadily advancing toward the goal, and have no fear of failing to reach it. Living, as I do, in the very heart of nature, isolated from all the diversions of civilization, one absorbs the life of the jungle and becomes imbued with its spirit. For miles and miles away on three sides of me spread the great forest, teeming with life and action. Often I sit alone in its depths and listen to the voices around me. I find no lack of them. Such is my experience in the study of wild life and the speech of animals.

Legislature and Literature in London

BY JUSTIN McCARTHY

NOTHING that has past in the House of Commons during the last few weeks has had for me so peculiar an interest as the appearance of Mr. John Morley in his new official capacity when he rose to give to the House an account of his Government's Indian policy. It seems hard to associate John Morley with the sort of policy which even a Liberal Government finds itself apparently still condemned to carry out in its management of India. John Morley, as my American readers well know, has ever been a Radical of the Radicals—not a mere clamorous advocate of the right of everybody to do as he pleases, but a thoroly broad-minded, philosophical Radical, a Radical of the order represented by John Stuart Mill, a man who refuses to recognize any privilege of the strong for the oppression of the weak, of a civilized government to coerce an uncivilized foreign people into the acceptance of a form of civilization unwelcome to it. Yet the official position which Mr. Morley now occupies, that of Secretary of State for India, imposes on him the duty of maintaining to the best of his power that system of government in India which can only be maintained even still by proclamation of the fact that England has force enough at her disposal to compel, if necessary, obedience to her rule. Just at present there is threatened disturbance in several parts of British India. That feeling of national sympathy which is making itself such a power all thru the world at this day is spreading like a rapid flame thru England's dominions and is showing itself more and more here, there and everywhere in an impatience of British absolute rule. The day has gone by when the Indian populations could be content to remain mere vassals, even if well governed and fairly treated vassals, of the British ruling power; and the day apparently has not yet come when English statesmanship can make up its mind to recognize in those populations the claim and the capacity for local self-government which have long since been admitted, altho very reluctantly admitted in the case of the Canadians and more lately in the case of the Australasian peoples. Mr. Morley in his speech recognized sympathetically the growing evidences of such a desire and such a claim in the peoples of India and spoke hopefully of a coming time when the capacity and the claim could be recognized. But he was not able to tell of anything which could be accomplished at the present moment toward such a change of conditions, and the immediate danger threatened is that there may be here and there some outbreak which might call for instant repression. There was a tone of deep and genuine pathos in all this part of Morley's speech, and the House could not but feel that any such task of repression would be to him, even if a duty, yet none the less a most uncongenial and most painful duty. Every one who knows the man must know how entirely his sympathies go with the struggles of a people for the recognition of its nationality and its claim to something like national self-government; and I am certain that the great majority of those who listened to him in the House of Commons understood and appreciated the difficulties of the task imposed upon him. I have had the honor of Mr. Morley's friendship for many years, and during the time when he was Chief Secretary to the Lord Lieutenant of Ireland—he held that office twice under different Liberal Governments—I had many opportunities of knowing how painful it was to him to have to conduct the work of a department which could only impose coercion, where his own desire would have been to bestow the right of home government. Morley did the best he could for Ireland and the Irish people under the trying conditions of the time, and his sympathy and his purposes were thoroly understood and valued by all the Irish Nationalists. We knew that he was

doing all he could for Ireland, and most of us still cherish the hope, or indeed I might say the conviction, that in the ordinary course of human affairs he may before long be a member of the Government which is to endow Ireland with a genuine system of home rule. In the meantime the world may feel quite sure that Morley will do all he can to protect the Indian populations from undue coercion and to open up to them some fairly representative system which shall make their country a part and not a vassal of the British Empire.

But just now what are the prospects of the Liberal Government? The anti-Liberal press has been vehemently assuring us day after day that Sir Henry Campbell-Bannerman and his colleagues have utterly failed to fulfil any of their promises, that they cannot hold together much longer, that they are hopelessly divided in counsel among themselves, and that they will soon, even very soon, have no alternative but to appeal to the country and take their chances at a General Election. I do not believe that the Government is in the least degree likely to be driven into any such desperate course. Sir Henry Campbell-Bannerman has himself declared in public more than once quite lately that he has no idea whatever of abandoning the task which he undertook on becoming Prime Minister, and for which he had the support of an unparalleled and overwhelming majority at the recent General Election. It is true that he and his Government have thus far failed in some of their purposes. They failed with their measure of education because the House of Lords would not have it; but Sir Henry Campbell-Bannerman is still quite determined to bring in and carry thru some measure in the House of Commons which is to have the effect once for all of abolishing the merely destructive power of the hereditary chamber. Then, again, the Government failed in the attempt to satisfy the claims of the Irish people for national self-government, failed because the scheme introduced as a provisional movement in that direction proved utterly unsatisfactory to the Irish people. Furthermore, Sir Henry and his colleagues have put off until next session the measure which they had intended to introduce for the better regulation of the existing system of licenses for the sale of intoxicating liquors, a measure to which the advocates of temperance belonging to all classes and sects were looking forward with intense interest. It is not too much, therefore, to say that the present session has been practically a session of failure for the Liberal Government.

The Conservatives and Unionists of all sections have found in this failure a delightful opportunity for proclaiming that the present Government is already an absolute and an acknowledged failure and for insisting that it must before long be driven by sheer despair into an appeal to the country at a General Election. *Punch,* which has lately been very much of a Conservative in politics, devoted in its number just published a full-page sketch to a caricature of Sir Henry amid his difficulties and has another and smaller caricature of him a page or two farther on. For myself, however, I do not believe that any of these predictions may be regarded as forecasts worthy of serious attention. I still feel convinced that Sir Henry Campbell-Bannerman, with the support of men like John Morley and Augustine Birrell, will resolutely carry out their program of legislation and will endeavor to render justice to the cause of education, to the national demands of Ireland, to the promotion of temperance and to the task of reducing the House of Lords to its proper place in England's constitutional system. We all know that some, even among the influential colleagues of the Prime Minister and in his Cabinet, are rather of Lord Rosebery's way of thinking just at present, but I still entertain the fullest hope that the general feeling of Liberals all over the country will sustain the Prime Minister and John Morley and Augustine Birrell and enable them to accomplish the work with which they have identified themselves. The outcries of the Conservatives and the Unionists have no terrors for me.

Sir Henry Campbell-Bannerman has in good time made known to the House and to the world the terms of the measure which he intends to propose with the object of restricting the powers of the Hereditary Chamber. The resolution is

brief and to the point. It declares that its purpose is "to give effect to the will of the people as expressed by their elected representatives" by restricting the power of the House of Lords to alter or reject bills past by the Commons and to secure "that within the limits of a single Parliament the final decision of the Commons shall prevail." The meaning of this is that if the House of Lords should reject a measure past by the representative chamber or should spoil it by alterations that damaging or destructive force shall only prevail for a single session. If the House of Commons should renew the measure in its former shape and send it back in the next session to the House of Lords the peers would then have no power to make any alteration whatever in it, but must pass it as a matter of course. This, it will be obvious, would reduce the House of Lords to be a mere nullity in legislation and would indeed proclaim it as the most inane and absurd of existing political institutions; but it would, at all events, deprive it of its power of destroying progressive legislation and leave to it only the power of delaying such legislation for a single session. It is hard to imagine any assembly of respectable and educated men, such as we may admit even the House of Lords to be, consenting to take any active part in so inane and unmeaning an institution. It may be taken for granted, however, that if the House of Lords will not accept the doom of death by gradual inanition it will have to accept its doom by some sudden stroke of the nation's power, for it is perfectly certain that the English public will not any longer endure the interference of an unrepresentative chamber.

Some time since I contributed to THE INDEPENDENT in one of my articles a review of a volume of stories by my former Parliamentary and political colleague and dear friend, the late Edmund Leamy, whose name is well known wherever Irishmen find a home. A second volume of stories from the same hand has just been published by Messrs. Sealy, Bryers & Walker, of Dublin. The volume is entitled "By the Barrow River and Other Stories," and it has a preface from the gifted hand of Katharine Tynan. One of these stories was the last ever written by Edmund Leamy before his death. It was written in France during his last illness, and is now in print for the first time. This latest volume has all the author's marvelous literary characteristics, the imagination often weird and nerve-thrilling, the rich vivacious humor, the keen shrewd observation and the all-suffusing poetic vein. I have often been reminded as I read thru this volume of the many peculiar qualities which belong to the short stories of Edgar Allan Poe, and I venture to think that any of my American readers who may be induced to read this latest work of Edmund Leamy will say that I am doing no injustice to the great American author by my comparison.

In "Colonel Daveron" (Hurst & Blackett) Mr. Percy White gives us another of his wonderfully clever and subtile character studies. It is one of the peculiarities of Mr. Percy White's art that he can make a character, in itself unsympathetic, so real and so human that one cannot help feeling a certain amount of sympathy with the man or woman as drawn by him. There is no doubt that the chief interest of this novel centers in the unfortunate Colonel Daveron and in the study of the effect of failure on the mental condition of a proud and selfish man. It is tragic indeed, and the story would be almost too painful if it were not for the other characters—Evelyn Daveron, the Colonel's wife, who does everything possible to help her husband to make a success in a new field; Tony Derrick, the chapters about whose school days are among the most charming in the novel, and Perdita, fascinating both as a child and as a young girl. The story ends happily for all except the ill-starred Colonel, but no happy ending would seem to be possible for him.

"The Crimson Azaleas," Mr. H. de Vere Stacpoole's new novel, published by Mr. Fisher Unwin, is one of the most beautiful stories I have read for a long time. No other story about Japan that I have read makes one understand so well as this does the fascination of the place, the scenery, the atmosphere and the people, and most charming of all is

the heroine, Campanela, an adorable little Japanese girl, who is found by Leslie and McGourlay, two Scotchmen, on the road to Nikko. The manner of her being found is mysterious, but I will not tell my readers anything of the story, as it might spoil the pleasure of some in reading it. The fact that the story is terribly sad does not make it less delightful to read—it is a story that one could read many times and enjoy it more each time. It makes one long to go and live in Japan.

I wrote in my last letter about the Color Books that Messrs. Chatto & Windus are publishing. They have just brought out one called "The Color of London," with extraordinarily clever pictures by a young Japanese artist, Yoshio Markino. I hope to write more of it in my next letter.

LONDON, ENGLAND.

That Famous "Hole in the Sky"

BY PROF. WILLIAM C. WILKINSON, D.D.

[Dr. Wilkinson has been Professor of Poetry and Criticism in the University of Chicago since 1902, and is the author of various volumes in these departments.—EDITOR.]

THE recent death of former-Senator Ross of Kansas recalls to mind a very memorable incident of political history, the attempted impeachment of President Andrew Johnson. Only those whose personal recollections run back to the date of that incident can now fully appreciate the extraordinary excitement which then prevailed thruout the nation. To many superheated minds of the day it seemed almost as if the national life hung suspended on the decision of the issue. It is now, I suppose, quite generally, if not universally, felt that the disposal made of the matter was, on the whole, for the best for every interest involved—personal, partisan, national—unless indeed exception be made of the case of Senator Ross, whose single vote it was that turned the scale in favor of acquittal. That vote had the apparent effect to consign Senator Ross to political oblivion, so disappointed, not to say outraged, were his fellow radicals at his defection from their ranks.

The impeachment proceedings were illustrated by some very remarkable episodes of oratory. Among these there is perhaps no other so worthy of continuing remembrance as is a passage at arms that occurred between Manager Boutwell of the prosecution and William M. Evarts of the counsel for the defense. How much Mr. Evarts's unsurpassable raillery at Mr. Boutwell's expense may have affected the Senatorial jury in the case it is, of course, easy to say; for naturally it did not affect that jury at all, in the way, that is, of influencing their votes, tho in the way of amusing them irresistibly it cannot have failed to affect profoundly those of them who had any faculty for appreciating humor. I think that the effect upon the country at large—for the whole country was suddenly set off in peal upon peal of uncontrollable laughter—could not but have been wholesome and remedial. It was a needed relief of the uncomfortable, almost dangerous, tension.

Mr. Evarts had a national, even an international, reputation as a wit, but as he never, before or after, exercised his gift on a stage so conspicuous, so he never on any other occasion exercised it to such supremely happy result. His masterpiece of blended wit and humor achieved on this great occasion deserves to be forever preserved among the immortal classics of such oratory. The art of it was consummate. The tantalizing prolongation of the suspense in which he held up his antagonist to perfectly good natured, but perfectly merciless, ridicule was as much the triumph of art as it was the inspiration of a genius for banter. I wish I were warranted in saying that Mr. Boutwell himself en-

joyed the fun that was made of him; I do not see how he could well have helped doing so, but perhaps his distempered condition of mind disqualified him.

The report appears abundantly punctuated with parentheses of ("laughter"), which I reproduce for challenge to the mirth of the reader. First comes a passage from Mr. Boutwell. The present-day reader will find it difficult to conceive how such a strain of speech was possible from a man of Mr. Boutwell's standing in general esteem — this, whether the passage be considered merely from the point of view of sanity in discourse or from the point of view of reason in sentiment toward President Johnson:

Mr. Boutwell—"Travelers and astronomers inform us that in the southern heavens, near the Southern Cross, there is a vast space which the uneducated call the 'hole in the sky,' where the eye of man, with the aid of the powers of the telescope, has been unable to discover nebula, or asteroid, or comet, or planet, or star, or sun. In that dreary, cold, dark region of space, which is only known to be less than infinite by the evidences of creation elsewhere, the Great Author of celestial mechanism has left the chaos which was in the beginning. If this earth were capable of the sentiments and emotions of justice and virtue which in human beings are the evidence and the pledge of our divine origin and immortal destiny, it would heave and throb, with the energy of the elemental forces of nature, and project this enemy of two races of men into that vast region, there forever to exist in a solitude as eternal as life, or as the absence of life, emblematical of, if not really that 'outer darkness' of which the Saviour of man spoke in warning to those who are the enemies of themselves, of their race and of their God."

The opportunity offered in such solemn absurdity from Mr. Boutwell for effective take-off from Mr. Evarts, was, of course, happy in the extreme: but the felicity of the opportunity was fully met and matched by the felicity of the manner in which Mr. Evarts availed himself of it.

Mr. Evarts—"I may as conveniently at this point of the argument as at any other pay some attention to the astronomical punishment which the learned and honorable manager, Mr. Boutwell, thinks should be applied to this novel case of impeachment of the President. Cicero I think it is who says that a lawyer should know everything, for sooner or later there is no fact in history, in science or of human knowledge that will not come into play in his arguments. Painfully sensible of my ignorance, being devoted to a profession which 'sharpens and does not enlarge the mind' (laughter), I yet can admire without envy the superior knowledge evinced by the honorable manager. Indeed, upon my soul, I believe he is aware of an astronomical fact which many professors of that science are wholly ignorant of. But, nevertheless, while some of his honorable colleagues were paying attention to an unoccupied and unappropriated island on the surface of the seas [as a place, I understand, of punitive exile for the President], Mr. Manager Boutwell, more ambitious, had discovered an untenanted and unappropriated region in the skies, reserved, he would have us think, in the final counsels of the Almighty, as the place of punishment for convicted and deposed American Presidents (laughter).

"At first I thought that his mind had become so 'enlarged' that it was not 'sharp' enough to discover that the Constitution had limited the punishment; but on reflection I saw that he was as legal and logical as he was ambitious and astronomical (laughter), for the Constitution has said 'removal from office,' and has put no limit to the distance of the removal (laughter), so that it may be (without shedding a drop of his blood, or taking a penny of his property, or confining his limbs) instant 'removal' from office and transportation to the skies (laughter). Truly, this is a great undertaking, and if learned manager can only get over the obstacles of the laws of nature, the Constitution will not stand in his way. He can contrive no method but that of a convulsion of the earth that shall project the deposed President to this infinitely distant space; but a shock of nature of so vast an energy and for so great a result on him might unsettle even the footing of the firm members of Congress. We certainly need not resort to so perilous a method as that. How shall we accomplish it? Why, in the first place, nobody knows where that space is but the learned manager himself, and he is the necessary deputy to execute the judgment of the court (laughter). Let it then be provided that, in case of your sentence of deposition and removal from office, the honorable and astronomical manager shall take into his own hands the execution of the sentence. With the President made fast to his broad and strong shoulders, and, having already essayed the flight by imagination, better prepared than anybody else to execute it in form, taking advantage of ladders as far as ladders will go to the top of this great Capitol, and spurning then with his foot the crest of Liberty, let him set out upon his flight (laughter), while the two houses of Congress and all the people of the United States shall shout, '*Sic itur ad astra!*' (laughter).

"But here a distressing doubt strikes me: how will the manager get back? (laughter). He will have got far beyond the reach of gravitation to restore him, and so ambitious a wing as his could never stoop to a downward flight. Indeed, as he passes thru the constellations, that famous question of Carlyle, by which he derides the littleness of human affairs upon the scale of the measure

of the heavens, 'What thinks Boötes as he drive his dogs up the zenith in their race of sidereal fire?' will force itself on his notice. What, indeed, will Boötes think of this new constellation? (laughter). Besides, reaching this space, beyond the power of Congress even, 'to send for persons and papers' (laughter), how shall he return, and how decide in the contest, there become personal and perpetual—the struggle of strength between him and the president? (laughter). In this new revolution, thus established forever, who shall decide which is the sun and which is the moon? Who determine (the only scientific test) which reflects the hardest upon the other" (laughter).

After we have done laughing with Mr. Evarts in his inimitable pleasantry, we shall do well to consider seriously how nicely adapted was such an interlude of comedy to make seem ridiculous, as really it was, the overstrained morbid state of mind exhibited in Mr. Boutwell's oratory. And Mr. Boutwell's state of mind was also that of a good part of this great American nation at the time. Our national saving sense of humor was for the moment in abeyance. Mr. Evarts appealed to it successfully.

Mr. Ross, however, with his disappointing vote, was the man who came effectually to the rescue. And who can say it was not Mr. Evarts's humor that decisively at last turned the scale of judgment in Mr. Ross's hesitating mind?

CHICAGO, ILL.

The Vatican and The Hague

BY SALVATORE CORTESI

EVEN without taking into consideration that the United States, with its 14,000,000 Roman Catholics at home, and with those of Porto Rico, Guam, Hawaii and the Philippine Islands, has become the fourth Catholic power in the world, Protestants as well as Catholics must be interested in knowing the attitude and the feeling of the Vatican, the most powerful politico-religious institution which has ever existed, in connection with the Second Peace Conference at The Hague.

As every one knows, when about four years after having ascended the Muscovite throne, Nicholas II proclaimed his intention of calling an international meeting to agree on disarmament, Leo XIII had sat for twenty years in the Chair of St. Peter, and Cardinal Rampolla had already been for ten years his Secretary of State. In their far-reaching political schemes both had succeeded in establishing, or re-establishing, diplomatic relations with all the leading powers, including Russia, with the exception of America and England.

Russia had always been friendly with the Holy See until their relations were abruptly broken off under Pius IX, who could not look on in silence at the brutal treatment of the Poles, and especially of the Polish clergy, who were treated with great harshness. The break came one day when Pius IX, in a private audience, remonstrated with Baron de Mayendorff, the Muscovite representative. The Baron was not at all conciliatory, and ended by remarking that the word Catholic was synonymous with revolutionist. Pius IX, never remarkable for patience, bounded to his feet, showing the insolent diplomatist to the door, with—it is asserted—the assistance of the Pontifical slipper. After this the relations of the Holy See and Russia remained strained until Leo XIII succeeded in re-establishing friendly communications, ending with the appointment of M. A. P. Isvolsky, who is now Russian Minister of Foreign Affairs, as Minister to the Vatican. But then, as now, while Russia has a Minister accredited to the Holy See, the Czar refused and refuses to allow the Vatican to have a Nuncio to St. Petersburg.

It is thus much more interesting to see how the Vatican looks at this Second Hague Conference at eight years' distance from the other, and under a new Pope, and a new and quite young Secretary of State, the latter for the first

time after a long number of years not being an Italian.

In 1898, when the Czar announced his noble and humanitarian project, the assistance given by the Vatican and personally by Cardinal Rampolla to the negotiations which led to the Dual Franco-Russian Alliance was still so recent that the Government of St. Petersburg could not ignore the Holy See. So Count Muravieff, in his first circular note to the Powers, stated that to the conference ought to be invited only the Powers represented to the Russian Government. All the same as an act of deference to the Pope, so that he might use his moral influence in favor of the idea of the Conference, the Czar had communicated the same circulars that had been sent to the Powers represented at St. Petersburg to the Secretaryship of State of the Vatican, thru the Russian Minister accredited to the Holy See. After this, altho the official invitation to the Conference had not yet been extended to the Vatican, it was considered as sure, and the too zealous friends of the Papacy began to proclaim the great victory won by papal diplomacy, adding that it was a recognition of the Pontiff as a temporal sovereign, an international protest against the state of things created for the head of Catholicism by the taking of Rome in 1870, and the bankruptcy of Italy as a lay State in opposition to the "rights" of the Church.

Under Pius X such a situation is impossible, as, while he thinks that no Pope can consider himself authorized to renounce, for the institution of which he is the head, the claims so strongly and continually set forth by his two predecessors with regard to obtaining, thru temporal power or otherwise, a better guarantee of the independence of the Papacy, he wishes that the Church should become an active element of economical and political revival in Italy, and that the clergy should no more be considered as unpatriotic and retrogressive. That is why, altho protesting against the visit of President Loubet to King Victor Emanuel at the Quirinal, Pius X has allowed clerical electors for the first time since 1870 to enter the political arena and vote for candidates favorable to the Savoy Monarchy; and when in 1905 the earthquake devastated Calabria he had the impulse to hurry to the spot to comfort his "children," but resisted, fearing that his breaking the voluntary imprisonment in the Vatican would be interpreted as a renunciation of the "rights" of the Church. Instead he collected funds thruout the world to assist the Calabrian victims. Many other examples might be cited to demonstrate that Giuseppe Sarto, as a man and as a bishop, is favorable to present institutions in the Peninsula, but as Pius X, as Pontiff of the universal Catholic Church, he does not think he should abandon those claims to which the Papacy is entitled after a history of so many centuries.

In other words, with the present Pope the claiming of a different arrangement between the Holy See and United Italy is merely a secondary part of his program, and it is carried out in the most friendly manner possible, while with Leo XIII and Cardinal Rampolla it constituted the basis of their whole policy, and even affected the religious standing and action of the Church. Pecci and Rampolla, the two strongest statesmen the Vatican has produced since the death of Cardinal Consalvi, conceived a vast plan which was to bring back the lost territory to the Church. The fall of the temporal power was caused by the Franco-Prussian War, when Napoleon III was obliged to withdraw his troops from Rome. If France had not been defeated in 1870, Victor Emanuel would not have entered Rome. So the humiliation of the French people had as direct and immediate consequence the end of the pontifical temporal rule. The idea of Leo XIII, and his Secretary of State, was to so identify the Holy See with France that when sooner or later the day of her *revanche* came it would also be the *revanche* of the Papacy. For several years this policy seemed very able. The Vatican diplomacy was entirely at the service of France, and played a considerable part in the conclusion of the alliance between St. Petersburg and Paris, but it did not succeed in the effort to detach Austria from the Triplice, which would have been a master-stroke, as it would have left Germany alone with Italy. Indeed the insistence at the Court

of Vienna was so great in this direction that the personal relations between Emperor Francis Joseph and Cardinal Rampolla suffered to such an extent as to represent for the Secretary of State of Leo XIII the loss of the tiara in the Conclave of 1903, thru the veto to his election brought by Cardinal Puzyna, Archbishop of Cracow, in the name of Austria, and pronounced when the Sicilian Cardinal had already received half the votes of his colleagues.

Contemporaneously nothing was spared to oppose the Italian Government in her international policy, as well as at home, going so far, for instance, that in the serious riots in Milan, in May, 1898, Cardinal Ferrari and the clericals assisted the Republicans, Socialists and Anarchists in what they hoped might become a successful separatist movement.

After this explanation it will be easier to understand how different the situation between Church and State in Italy was on the eve of the first Peace Conference to what it is now under Pius X, and how different was the feeling of the men who were at the helm of affairs both at the Vatican and in the Italian Government.

When, in 1898, as we have seen, the invitation to the Vatican to assist at the first conference seemed sure, it was natural that to many it must have seemed as a check to the Italian State. All the same the Italian Minister of Foreign Affairs, of the time, Admiral Canevaro, just back from the success he had attained as commander of the international European fleet in Greek waters, was of a different opinion. He was convinced that a day would come in which the Vatican and Italy would agree upon their respective interests, and that the moment would arise for the Government to demonstrate its conciliatory intentions. This moment, according to him, arrived when the Vatican was using all its influence to be invited to the first Hague Conference. He proposed that Italy should favor their endeavors, or that a group of Powers should ask Italy to give her consent to the presence of the Vatican at the conference, which she would at once have done, thus showing her conciliatory attitude on the one hand, and her position of pre-eminence toward the Holy See on the other. The Council of Ministers, however, fearing that the attitude proposed by Admiral Canevaro would be wrongly interpreted by the public, and would be considered as weakness toward the Vatican, decided that Italy should withdraw from the conference if the Pope was asked to participate in it. The situation was very serious for the Government of Rome, as Russia and France were openly favorable to the participation of the Pope; Germany would have liked to please the Vatican, partly for reasons of internal policy as they needed the support of the Catholic Center, partly to give a lesson to Italy which had already begun to flirt with France, and finally Austria would, as usual, have done what Germany wished. Fortunately, England needed to find supporters to exclude the representatives of the South African Republics, so an understanding between Rome and London was not difficult, and on February 22d, 1899, the British Government informed Russia that England would not be represented at a conference in which Italy could not be present.

This put an end to the hopes of the Vatican, and Cardinal Rampolla understood this so well that the next day, there being in the French Church of San Luigi dei Francesi, of Rome, a solemn funeral mass for the repose of the soul of Felix Faure, the Papal Secretary of State, after having shaken hands with all the diplomatists present, purposely and ostentatiously turned his back on Admiral Canevaro, causing an international incident, and obliging France to present her excuses the same day for the offense to the Italian Minister on what is considered French soil.

To recall this situation and these incidents now seems almost as tho speaking of a far distant time, so great is the change which has taken place. If there were not the precedent of 1899 the Italian Government would have now no objection to the Pope's sending a representative to the second conference, and if the Vatican had a delegate at The Hague, it may be taken as sure that immediately after the interests of the Church it would be anxious to support and assist the delegation of the Italian Government, without, however, making too much show of this for reasons which

I showed before in describing the attitude of Pius X toward Italy.

The Pope and Cardinal Merry del Val informed the Powers, and especially Russia and Holland, that the Vatican would morally and materially support every decision of the conference aiming at humanitarian principles, and having the object of rendering war impossible or mitigating its horrors.

ROME, ITALY.

Notes on Men and Things

BY KARL BLIND

[The following paragraphs are selected from letters written to Theodore Stanton by Karl Blind, the German republican, who died in London last May at the age of eighty. It will be remembered that he took an active part in the revolution in Baden in 1848, was imprisoned several times and barely escaped with his life; was banished from France during the Second Empire because of his opposition to the Imperial régime, and co-operated from his exile home in England with all the liberal movements on the Continent. He was a voluminous writer on many different subject.—EDITOR.]

LONDON, November 14, 1888.

PERHAPS you will be surprised when I say that I take a great interest in aerial navigation since the time when I first made an ascent with Mr. Glaisher the meteorologist, and a number of French aeronauts—among them my old friend Wilfrid de Fonvielle,* with whom I am in continual contact; Godard, Yon, Mangin, Chavantier, Tissandier and others — in the gigantic captive balloon, which afterward broke loose, shortly before another ascent with electrical light at night, had been planned. Only the Duke of Sutherland and three others — among them myself—had accepted this latter invitation. By a fluke, our lives were saved by this timely breaking loose. That was about twenty years ago, and since then I have followed aeronautical matters very closely. I believe in the coming navigability of balloons; and I was glad, when lately at the seaside, to meet there with a recent publication of General Hutchinson, which gives a scientific opinion in the same sense. Perhaps I may mention that some years ago I was the means, in consequence of an appeal I made in the Literary Gazette of the Berlin *Vossiche Zeitung*, of bringing about the establishment of the German Society of Aeronauts. The society when founded—the military element has now a part in it—asked me to be the first medium of its correspondence with the London Balloon Society, which I did.

KARL BLIND.

*THE INDEPENDENT of October 12, 1905, contained an interesting article by this veteran balloonist, "The Impressions of an Aeronaut."—EDITOR.

LONDON, December 18, 1888.

With you, I fear that John Bright will not live very long. I do not know whether you are aware that I proposed and drew up the International Address to John Bright, which was signed by a number of the most eminent scientists, legists, political leaders, etc.—a number of them personal friends of mine—of the Netherland, Germany, Austria, Hungary, Italy, France, Spain, etc., and which asked for the Transvaal War being stopped, and the South African Republic recognized by England. I sent the address to John Bright, who was then a Cabinet Minister, and he replied to me in a favorable letter. This was the turning point of the affair.

LONDON, April 20, 1889.

The latest news I have about Kossuth is that he is better again. His sons, who had been called to Turin, have left again. Still, as he is in his eighty-seventh year, his end, in his weakened state of health, cannot be far off. I certainly know a good many things about him, for and against, since 1848. I well remember the presentation made to him at the London Tavern, when he first came over, by Cobden. So also matters of his intercourse with Mazzini and Ledru-Rollin, during his membership in the Central European Democratic Committee. Again, the strange affair of his proposal to the Duke of Leuchtenberg, toward the end of the Hungarian War of Independence, which was charged upon him here by Szemere, the Hungarian statesman. I remember what he did here in 1859, at the time of the Italian War, and curious details about his connections with the Government of Louis Napoleon and the Danubian Confederation scheme, with remarks made to me by General Klapka, the Hungarian patriot.

LONDON, October 29, 1896.

The death of Challemel-Lacour has brought up some recollections in my mind. When he arrived here as French Ambassador he was at once assailed in the House of Commons by a member of the Irish party, a violent Ultramontane. These attacks were often repeated and led to a formal discussion. The object was to make him impossible as an ambassador. Then came the proposal of erecting a monument in Westminster Abbey for the son of Napoleon III. We formed a committee here, which agitated in the press and at public meetings against that intention. I proposed and drew up an address to Challemel-Lacour, in which our protest was embodied, together with a reference to the disgraceful attacks made upon him. This address, adopted at a mass meeting, was presented to him by a deputation. Sympathy with the French Republic was strongly expressed. In the end the monument had to be abandoned. I made afterward the personal acquaintance of Challemel-Lacour on the occasion of the annual banquet of the Cobden Club, of which he and I were honorary members. I much regretted later on to read his speech as President of the French Senate, in which he expressed the "homage" of France to the Czar Alexander III. I fear the result of this new attitude of French Republicans will have finally a bad effect at home, in the way of fostering Cæsarist tendencies, and that it will lead to a further increase of militarism, both in France and in those states that feel themselves endangered by the "comradeship of arms" between Russia and France.

LONDON, January 10, 1891.

An article on the late Hon. Roden Noel, a brother of the Earl of Gainsborough, who died so suddenly in Germany some months ago, might perhaps not be unwelcome. I have known him for about fourteen years, and we were with him in spring last year in his house at Brighton, and he with us, at the house where we stayed there, when we had many interesting conversations. His poetry is less generally known than it ought to be. I can say so very impartially, for, after having for a while been a freethinker and a Unionist, he changed views, and there runs thru his poems a great deal of mysticism—whilst I am at the opposite pole from these ideas of his. We talked quite freely about it with him, and as he was well conversant with philosophical systems—Eastern, classic and modern—he rather liked a full conversation on such subjects. Of late he had become a kind of Christian sociologist, a would-be disestablisher of the House of Lords, and so forth.

Literature

The Life of Isabella Bird

THIS admirable biography of Mrs. Bishop,* whose letters from foreign lands have attracted the attention of two generations of readers, might well have been entitled The Story of a Brave Lady. It has all the fascination of a Sinbad tale and all the charm of an old-fashioned romance. And the book will appeal especially to these old friends of Mrs. Bishop, since it not only contains an account of her work, but of those forces and circumstances which molded her character. The initial chapters tell of her parentage, childhood and education, and are not the least interesting part of this volume.

Isabella Lucy Bird was born October 15th, 1831. She was a delicate child, and suffered from an incurable disease of the spine. This latter affliction, instead of rendering her an invalid, was undoubtedly the spur which urged her upon journeys into remote countries, so arduous and dangerous and difficult that few men could have endured them with equal spirit and fortitude. Anna M. Stoddard in her preface to this volume writes:

"As a traveler, Mrs. Bishop's outstanding merit was that she nearly always conquered her territories alone; that she faced the wilderness almost single handed; that she observed and recorded without companionship. She suffered no toil to impede her, no study to repel her. She triumphed over her own limitations of health and strength as over the dangers of the road. Nor did she ever lose in numberless vicissitudes in intercourse with untutored peoples, or in the strenuous dominance which she was repeatedly compelled to exercise, her womanly graces of tranquil manner, gentle voice, reasonable persuasiveness."

Mrs. Bishop's first book of travels was written after a visit to Canada and the United States in 1854. It was entitled "An Englishwoman in America," appeared in 1856, and attracted wide attention, to the great surprise of the modest author. From this time till two years before her death in 1905, she was an indefatigable traveler, first in the out-of-the-way countries nearer home, then in "the wide East." She was especially interested in China, Japan and Korea, and her letters from the latter countries before the Boxer rebellion gave Mrs. Bishop a reputation as a political writer which she earned by the shrewdness of her observations and by the advantage she enjoyed of often being in touch with the powers behind the scene of action. She appears to have returned to England from time to time, to visit friends, to deliver addresses on missions in which she was deeply interested, and to prepare for other travels. Her last journey was to Morocco in 1900. After her return to England in 1901 she was still actively engaged in lecturing, writing and developing her Eastern photographs, many of which adorn this volume, but her labors as a traveler and explorer were done.

The most admirable feature of this biography is that it gives the more personal side of Mrs. Bishop's life during the forty-six years of her travels. And closing the volume, the question arises in the light of the record it contains, whether many frail women would not have health if they had wings, or even the energy of wings in their spirits, as Mrs. Bishop had. It is sitting too long upon the bough at home that renders so many of them complaining invalids. The lesson of Mrs. Bishop's life to every ailing woman is to escape the monotony of life, to do and to live healthily.

Shakespeare

WITH all the multitudinous books on Shakespeare there is always room for a fresh contribution. The little volume by Walter Raleigh,† professor of English literature in Oxford University, is especially welcome. It is a temperate, well-considered study of Shakespeare's life and writings. It has no novel theory to set forth; there is no new interpretation

*THE LIFE OF ISABELLA BIRD (Mrs. Bishop). *By Anna M. Stoddard.* New York: E. P. Dutton & Co. $5.00.

†SHAKESPEARE. [English Men of Letters.] *By Walter Raleigh.* New York: The Macmillan Company. 75 cents.

of the sonnets; there are no new explanations of cryptic utterances here and there. And except for a few harmless and not too positive speculations regarding the personality of John Shakespeare, there are no biographical novelties to exploit. Something, but hardly all, of what the average student already knows of the poet is related, and a general credence in the older traditions coming down thru Aubrey and the Rev. John Ward is avowed. Professor Raleigh is, it is true, provokingly hesitant and diplomatic regarding the main controverted questions, which for the most part he either bridges or evades; but on many matters he speaks with a sufficient positiveness. The greater part of his space is given to an examination of the scenes and characters of the plays and of the qualities of Shakespeare's art.

He does not wholly avoid decisions on the problems. In the matter of the sonnets he has no word for Pembroke or Southampton, and he does not so much as mention Mary Fitton. "The names of the persons involved," he writes, " are lost." He seems rather relieved at Mr. Sidney Lee's discovery of William Hall as the "onlie begetter," because "it has one immense advantage: it makes waste-paper of all the acrostic literature which has gathered round the initials of Mr. W. H., and leaves us free to consider the sonnets apart from the dedication." But with all his guardedness, and even, in this matter, involution of phrase, he definitely parts company with Lee, and declares the sonnets made "from the material of experience." So to declare is not quite the same as saying that they are autobiographical, but in substance this is the decision.

He is not so happy in another of his judgments. When he declares the Shakespearean stage to have been bare, he shows an unfamiliarity with the more recent literature of the matter. It is the general agreement today that tho the stage in Sir Philip Sidney's day was virtually bare, stage devices of various kinds were employed during the Shakespearean régime.

He is to be commended for his treatment of the commentators who are perpetually searching Shakespeare for hidden meanings. "The most careless and casual lines in his plays," he writes, "have been twisted and squeezed in the hope that they will yield some medicinal secret. His poetry has been cut into minute indigestible fragments, and used like wedding cake, not to eat, but to dream upon." Shakespeare is subtle, "fearfully and wonderfully subtle; and he is sometimes obscure, lamentably obscure." But he did not deliberately use his verse as a hiding-place for odds and ends of one sort and another, and the common-sense attitude is best for interpretation.

The author protests, also, against the deifiers of Shakespeare who would ascribe to inferior pens whatever in the text appears to them to be below a certain presumed Shakespearean standard, and give to Shakespeare himself only what is highest and best. Shakespeare, he contends, assuredly does not reveal himself always at a sustained elevation. He copies whole pages from chronicles or from Plutarch, often tamely and with utter commonplace. In Dryden's words, he falls "into a carelessness, and, as I may call it, a lethargy of thought, for whole scenes together." It is when his imagination takes fire, or when his humor is touched, that he gives us those wonderful passages for which he is remembered. Doubtless much of the text is by collaborators, and doubtless also most of this assisted work is of an inferior character to that of Shakespeare. But the demands upon the poet were immense; he produced an extraordinary quantity of work; he wrote apparently with great rapidity and ease, and according to the tradition of the players, he did not blot. He must therefore have produced a certain quantity of inferior work; and it is the "ecstasy of criticism" which would portion out all the bad to the helpers and all the good to Shakespeare.

Very little is attempted by Professor Raleigh in adding to our store of facts. Rather his implication is that everything is already known that ever can be. But he has added something of value in the citations he has made to contemporary works descriptive of English life and scenes, which aid us in picturing the setting of the plays. He has also given some results of a study of Shakepeare's

syntax and word-coinage. Against DeQuincey's sweeping generalization that Shakespeare never violates the laws of syntax, he gives examples the most glaring; and he has also sorted out a number of the poet's wholly original uses of words.

Anything on Shakespeare is reasonably sure to be read somewhere. For this little volume it is safe to predict a large degree of public favor. It reveals, it is true, many instances of bad logic and an abundant lack of system; and its diplomatic avoidance of the enduring Shakespearean problems, much in the style of Tennyson's chancellor, who, "smiling, put the question by," is often irritating. But it is in many respects brilliant, the style is almost epigrammatic in its sententiousness, and the felicitous aptness with which the text is quoted amounts almost to a display of genius.

The lectures of Karl Werder on the mystery of Hamlet, delivered in Berlin in the winter of 1859-60, are now translated for the first time.[2] Werder rejects the older explanation of Hamlet's delay in killing his uncle, which ascribed it to a temperamental weakness and cowardice, and contends that a regard for his own justification in the eyes of the Danish people prompted Hamlet to put off the act of vengeance in the expectation of publicly establishing Claudius's guilt.

As Mr. Rolfe shows in his careful introduction, this theory was first hinted in a London magazine article by George Fletcher, in 1845. It was first definitely stated by Prof. J. L. Klein, in a German publication, in 1846. Professor Werder was unacquainted with the work of either of his predecessors when he elaborated the theory at length. It has been fully accepted by such Shakespearean scholars as Dr. Furness, Mr. Corson, Professor Hudson and Dr. Rolfe, and rejected by Professors Tolman and Bradley. Professor Raleigh seems to believe that neither theory matters much. To Dr. Rolfe, however, Werder's theory is of the utmost importance, and he replies at some length to the attacks of Professors Tolman and Bradley. Perhaps had Dr. Rolfe carried further his speculations regarding the contradictions in the play—contradictions arising from the apparent fact that Shakespeare began it upon one plan and finished it upon another—he would have found that one theory would fit certain parts and the other theory other parts. The contradictions in the play regarding Hamlet's age are not to be harmonized. May it not be equally impossible to harmonize the contradictions regarding Hamlet's motives and policy?

Mexico of Today and of Yesterday

It is not long since one had to seek the sources of information about Mexico outside of that country itself, and often in another language than Spanish —in English and French particularly. This is still the case, to a considerable degree; but one of the signs of the times in "Modern Mexico" is the increasing number of really informative and authoritative writings on Mexican history and Mexican resources produced within the country itself.

During the past year a monumental work upon Mexico, its history, political organization, industries and natural resources, which was first produced in instalments in the Spanish language under the date of 1900, has been put forth in its complete form in three languages, English[1] and French, as well as Spanish. The form in which it is presented is in harmony with the comprehensiveness of the work and with the fact that it is semi-official in character and serves to set forth, at the beginning of the twentieth century, the remarkable progress of Mexico during the last quarter of the nineteenth century, seen against the background of the preceding half-century of turmoil and revolution and the preceding three centuries of colonial conquest and subordination. The covers are richly adorned with the striking national emblem of Mexico, paper and presswork are the best, and the volumes

[1] Mexico: Its Social Evolution. By a board of editors, headed by *Justo Sierra.* English translation by *G. Sariñana.* Two folio volumes in three. Pp. 778 (416 and 362) and 437. Mexico: J. Ballescá y Cía.

are splendidly illustrated with numerous full-page color plates and innumerable half-tones.

It is sufficient praise to say that the editors, all of them identified with the accomplishments of the modern era in Mexico, many of them in high official positions, have fairly realized the scope of the work, as thus stated by themselves:

"A synthesis of the political history, the administrative and military organization, and of the economic state of the Mexican Federation; of its progress on the intellectual side; of its territorial structure and the growth of its population; of its means of communication, domestic and international; of its conquests in the fields of industry, agriculture, mining, commerce and trade, etc."

This is a comprehensive program, and a skeleton of the contents will show how it has been carried out (the treatment under each head comprising, where possible, a review of the particular subject in prehistoric times, under the rule of Spain, and in the nineteenth century): Vol. I, part 1, covering geography and statistics of Mexico, the political history from the aboriginal civilization down to the overthrow of Maximilian's empire, the political institutions and organization of the present republic, and the national army and military affairs in all these periods; part 2 (separate volume), science, education, literature, municipal organization and local governmental institutions (an especially useful study in the history of such institutions on the Spanish model), penal establishments and charitable institutions, touching in many phases the social life of Mexico, and the evolution of jurisprudence in Mexico, covering especially the fundamental laws affecting family relations and property, also criminal law and procedure; Vol. II, first, an economic review, tracing thru all stages to the present state the growth of agriculture, mining, industries, trade, communications and public works, and public finance, and, lastly, a political history of the present era, the "Diaz régime," well done in a score of pages.

It is a work not to be overlooked by students not only of Mexico, but also of Spanish colonial history and of political institutions in all Spanish America.

A work on *The Sixteenth Century Forerunners of Mexican Independence*[2] deals with the appearance of tendencies toward separation from Spain during the first generation following the conqueror Cortés, and affecting members of his own family. Considerable has been published on the separatist tendencies visible from the first in Mexico, Peru and other Spanish colonies—a subject also receiving some consideration now from our own historians, as affecting also the first British colonists in America. This particular treatise would have been more valuable if extended so as to trace the separatist tendency in Mexico down to the nineteenth century, when circumstances let it loose in earnest. The treatise contains some curious data and incidents, among others an account (with a picture) of the application of the "water-cure" by Spanish military inquisitors to Martin Cortés, accused of conspiracy in 1568; it appears that "six jars of water" were employed in the effort to make him confess.

The eighth volume of the series of "Unedited or Rare Documents for the History of Mexico" is the record of the court-martial of General Leonardo Marquez,[3] which trial was suspended by the French invasion and which general thus escaped to figure under the Empire. The documents here brought to light contain some data on the "Wars of the Reform" prior to the foreign intervention. Much more gossipy and enlivening, tho of no vital historical importance, are the recently published reminiscences of one of the private secretaries of the whilom Emperor, Maximilian.[4] With much that is frivolous, and passages which somewhat offend a sense of propriety, there is also much of interest, and it is all entertainingly written. It sheds a most agreeable light upon the private character of Maximilian, as indeed do the writings of nearly all who came into personal contact with him. There are also some chapters on the Empress Carlota in Europe after her husband's execution, with some de-

tails of her madness, so recently terminating in death after so long an exile from her reason.

Some years ago President Diaz related to one of his close friends and one of the Ministers of his Government his recollections of his boyhood and his military career up to the taking of Puebla from the soldiers of the waning Empire. These reminiscences were privately printed, and, tho their contents have long been known to a good many, they had never been available to the general public. Translations of portions of them were furnished to a British lady who came to Mexico in 1905 to prepare a biography of Diaz, and in her book she has made much display of these passages as being from Diaz's "diary," hitherto unprofaned and opened expressly for her use. Perhaps in consequence of the publication of these fragments in such a manner, the reminiscences by General Diaz of his military career have recently been printed in a new form in Mexico.[5] The anonymous author has strung together his selections from the privately printed work referred to above, with expansion of certain incidents and editorial comments which, supposedly, comprise the effort described in his sub-title as an "Essay in Historical Psychology." The data he furnishes on the birth and boyhood of Diaz both supplement and correct previous publications. Apparently, the privately printed memoirs are not to be republished by themselves in a revised or unrevised form.

The Physical Characteristics of the Insane

The Scotch are a people particularly subject to insanity in all its forms. On this account it seems especially appropriate that the first comprehensive and thoro investigation of the physical characteristics of insane persons ever made should have been carried out on the inmates of asylums in Scotland, by a Scotch anthropologist financed by a Scotch "Trust Fund." This combination has resulted in the publication recently of a report,* which for the first time brings before the world abundant and thoroly scientific data which will make it possible to institute definite comparisons between the sane and the insane in respect to their bodily characteristics. In December, 1903, Mr. J. F. Tocher, an anthropologist of note, with two assistants, started on the appalling task of measuring certain characteristics on every insane person confined in an asylum in Scotland. The characters measured and recorded were: color of hair, color of eyes, shape of nose, stature, the length, the breadth and the hight of the head. To complete the measuring alone took a little more than a year of steady labor. The extent of the task may be judged from the fact that to set forth the bare statistics demands ninety closely-printed royal octavo pages.

Comparing the insane with the sane, it is found, first, that the mean or average stature of the Scottish insane is significantly less than that of the sane in all districts where data from the normal population are available for comparison. This at once suggests that nutritive disturbances influencing growth are, in the long run, fundamentally associated with the unstable condition of the mind, which finally leads to incurable insanity. Further, it is found that with respect to pigmentation the insane materially differ from the sane. The differences in this regard may be summed up by saying that on the average the insane portion of the population has lighter eyes and darker hair than does the sane population. A very interesting fact demonstrated by the statistics is that the class of persons among all the population which contributes the largest quota to the population of the insane asylums is that in which the individuals have light eyes and dark hair. For some reason, as yet entirely unknown, persons having these characteristics are especially likely to develop insanity. Persons with red hair and those with dark eyes are distinctly less liable to insanity. Interesting differences are found when the insane of different portions of the country are compared. Most striking is the fact

* Anthropometric Survey of the Inmates of Asylums in Scotland. *By J. F. Tocher.* Edinburgh: Henderson Trust Reports, No. 1. Pp. 8 139. Also The Anthropometric Characteristics of the Inmates of Asylums in Scotland. *By J. F. Tocher.* Biometrika, Vol. V, pp. 298-350. 1907.

that, with the exception of Edinburgh, the inmates of asylums in the great cities have smaller heads than those of the rest of the country. This brings us close to a problem which is both theoretically and practically of great importance. Are modern urban conditions of existence creating a physically differentiated, "city" type of the human species? Indirect evidence from a variety of sources indicates that this is in fact the case. Tocher's data for the insane lends strong support to such a view. Comparison of the insane and "habitual criminal" classes of the Scottish population shows a very distinct difference between the two. The criminals as a class are shorter and have larger heads than do the insane. A part of this difference, however, is, as the author points out, undoubtedly due to race differences in the two classes. About 35 per cent. of the habitual criminals in Scotland are of Irish extraction, while the insane form a class racially much purer. Significant is the fact that the criminals as a class are much more homogeneous physically (that is, they differ less among themselves in their physical characters) than are the insane.

Too much cannot be said in praise of the masterly way in which Mr. Tocher has marshaled and analyzed his data, bringing to bear on them all the refinements of modern statistical mathematics. The report is a notable contribution in the progress of the movement toward a broader biological study of man which was inaugurated by the development of the new science of "biometry."

Nineveh, and Other Poems. By George Sylvester Viereck. New York: Moffat, Yard & Co. $1.20

A Game at Love. and Other Plays. By the same. New York: Brentano's. $1.00.

There is probably no name bandied about nowadays more indiscriminately than that of genius. In the curious mixture of semi-official advertisement and indulgent applause which does duty for current criticism the word has become well-nigh meaningless, a mere commonplace of approval like excellent or capital, signifying nothing—or, if anything, raising only a natural and excusable prejudice against both author and critic. To read, therefore, the rather hysterical laudations of Mr. Viereck, numerous tho they may be, is not altogether convincing, particularly when they are compared directly with the verse that has given rise to them. As for *A Game at Love* and other dialogs, in prose, they may be dismissed at once as naught. They belong to the school of "the seedy sex impressionist," which has been out of date for some time now; and they are, besides, as dull as unfashionable vice usually is. With *Nineveh,* however, the case is a little different. But even in this instance the reports of Mr. Viereck's genius seem greatly exaggerated. Youth, the ecstasy of the senses, he has in generous measure. At times he is amazingly clever; tho, like clever children, he pays up for it by periods of dire fatuity. His imitativeness is marvelous, as is also his literary unscrupulousness. To make an impression seems to be his main concern; and to all appearance he is quite indifferent to the character of the means —whether he counterfeits another's lucky hit or perpetrates some calculated audacity of his own. His indiscretions, his lack of reticence in particular, have all the air of some naughty little boy's bravado. But the most significant thing of all about his verse is its affected corruption—its cultivation of a kind of suggestion which is not, after all, the most effective motive of poetry, superficially striking tho it may be. There have been poets of sense and sex before; there have been those who exploited with equal remorselessness the connection between sense and imagination. But what distinguishes the new Satanic school, of which Mr. Viereck is at present a member, from the old, is the introduction of a new note—the note of impotence. So far is his verse from being glad and free and powerful that there is something unmistakably weak and ailing and melancholy about it—a consciousness of depression and inadequacy—an inability to deal with life directly and powerfully either for good or evil. Whether the poet himself is so in reality is another matter—such is the character of his poetry. There is a kind of whine thru it all. It lacks intellectual substance. The language itself is a language of vague connotations; it fails to corre-

spond with the sharp and definite outlines of reality. The vision of life which it embodies—if embody be not too substantial a word—is founded in no actual experience; it is purely illusory, a fume of the senses only.

Tarry-at-Home Travels. By Edward Everett Hale. Illustrated. New York: The Macmillan Company. $2.50.

Edward Everett Hale is one of the royal men, and the men of whom he loves to talk were of the New England royal stock—Webster, Andrew, Sumner, Longfellow, Whittier, Emerson, Hoar, Asa Gray, Lyman Beecher. These men he knew, and barely missed a personal knowledge of Bowdoin, Knox, Israel Putnam, John Stark, Ethan Allen, Hancock, and the two Adamses. None wore the tiara—at least upright—but all wore it in their hearts, as Xenophon makes a great Persian leader say. The tone of the book is delightfully desultory. From State to State of the old Northeastern tier he conducts the reader, sometimes to mountain-tops, afoot, sometimes grasshopper-like, by unexpected leaps that land, one hardly knows how, on the neck of a king, at the fireside of a Senator, in the stony bed of the stream by which Benedict Arnold took his small, adventurous army thru the woods of Maine. The discourse, in this migratory hop-skip-and-jump, is of a breathless, fragmentary character sometimes, but it always has in its wisdom the essence of fireside meditation and the witty suggestiveness of the best fireside talk. Pure, kindly, optimistic is this best of senatorial chaplains. Half mischievous, half militant, he goes wherever his mood takes him, finding only what is good in men, and gently prodding this good to make it better. Like Thoreau he delights in claiming for his own dooryard all the felicities of traveled lands. In the six States, from Maine to Connecticut, there is the beginning of geological history, he says. Here is the earliest ridge of rock that emerged from the universal wash. "You and I, *for the convenience of things,*" he remarks, "may recollect that all of us New Englanders probably live over the oldest land in the world." Lest that fact should seem to condone "a certain arrogance" in circles near the "Hub," he hastens to observe that "really we have not much to do with that steaming rock of a hundred million aeons ago, for all New England was made over again, it seems, when the glaciers came down from the North, covering us all over with a sheet of ice which was a thousand feet thick, or more, even over the top of our Mount Washington." It was, of course, long after this war with the glaciers that the troglodyte gave place to kings. If a little ice remained in the neighborhood, it was for the purpose, perhaps, of cold storage, to preserve a land in which a single state, if in the continent of Europe, "would make a very decent empire." From this it will be seen why dear Mr. Hale should be optimistic about the northeastern land. He has been accustomed, for more than eighty years, to indulge in his "tarry-at-home travels" over its granite hills, under its old majestic elms and pines, the loss of which, in the interest of paper pulp and the yellow journals, he bemoans, as do we all.

Mother. By Maxim Gorky. New York: Appleton & Co. $1.50.

When Gorky's mission to America on behalf of the heroic Russian patriots had been ruined by the sensational representations of a portion of the press and the attacks of his political opponents he turned for consolation to his unfailing distraction—work. If the money of the American people was withheld from his struggling compatriots he could at least coin his own life blood into drachmas. A fury for creation possessed him; he begrudged the time needed for meals; the allurements of the woods and mountains among which he was secluded he stoically resisted. In the upper room of the beautiful camp in the Adirondacks where he toiled, the lamp burned constantly half thru the night and was sometimes dimmed by the brightening Eastern rays which caught the artist under the spell of his inspiration. This novel *Mother* was the chief product of that fertile period. In it Gorky paints, for the first time, the intimate life of the revolutionists, the motives and methods of the common folk with whom he had been working several years. The Mother is a plain peasant woman, whose brilliant son,

the hero of the book, wins her, chiefly thru her affections, to take the risks of revolutionary activity and partake of the joys of revolutionary comradeship. Her awakening to her son's views, a kind of inverted heredity, her motherly fears for his safety and her gradual elevation to the superb hights on which so many of the comrades dwelt, are depicted with tender, penetrating sympathy, and a sadness that made the friends of the author freely weep when he read aloud the Russian manuscript. Liberty-lovers who care to know the sources of the tiny streams that, rising all over Russia, are combining in the fierce river of revolution that promises to sweep away a corrupt autocracy will find this book both enlightening and interesting. Like all Gorky's work it is sternly realistic, free from the tricks of the romanticists, without elaborated plot, just a piece of the web of life, as plain and patternless as when it left the loom of the Fates.

A Friend of Marie Antoinette. By Frédéric Barbey. With a preface by Victorien Sardou. New York: E. P. Dutton & Co. $3.00.

The youthful son of Louis XVI is supposed to have been done to death by his cruel guards in the Temple, but his real fate has been the subject of many and long discussions. Several hundred books and pamphlets have been written to *prove* that he either escaped from the hands of his jailers or died under their charge. The most serious historians, however, are content to let the troublesome problem rest, for it matters not a whit what happened to the unhappy youth, in view of the fact that he never influenced in any way the course of French history. Nevertheless, the curiosity seekers and the lovers of the anecdotal and episodal are not satisfied, and Frédéric Barbey, a careful and painstaking young student, has written a new book of some two hundred and fifty pages under the title *A Friend of Marie Antoinette*, in which he endeavors to throw new light on the old question by tracing the relations of a certain Lady Atkyns to the unfortunate French Queen and her son, known to history as Louis XVII. Lady Atkyns was an English actress of some note who married Sir Edward Atkyns in 1779, whose wealth and position opened for his young wife the doors of the French court after they decided to take up their residence in gay Paris. They appear to have been at the French capital when the Revolution began, and Lady Atkyns seems to have been on extremely intimate terms with the unhappy Queen, whom she visited in prison, and whose son she sought to wrest from his jailers. The indefatigable Englishwoman labored, in spite of dangers and obstacles, to accomplish the great purpose of freeing the youthful heir to the fallen dignity of the French crown, and our author, who has had access to rare papers, believes that everything points to the success of the attempt to secure his escape, but disappoints us by concluding that the youth was spirited away from his rescuers just as he was about to embark for England. In short, he leaves us about where we were on the point, but he has told a charming tale, which is no less entertaining because it is in the form of documented history. The people who are interested in the fate of the Dauphin will be charmed by Barbey's delightful book; meanwhile the social and economic historian will plod on in his toilsome path.

Modern Bookbindings: Their Design and Decoration. By S. T. Prideaux. New York: E. P. Dutton. $3.00.

In *Modern Bookbindings* Miss Prideaux has admirably supplemented her former volume, "Bookbinders and Their Craft," issued thru the Scribners in 1903. Her present survey of the general subject of bookbinding has particularly to do with those produced by modern English and French binders. She recognizes the tremendous influence exerted by William Morris upon the English binders of today, and pays deserved tribute to certain of the modern English bookbinding craftsmen, including Cobden-Sanderson and Douglas Cockerell. It is but natural that when a wave of refined and cultured taste on the part of book collectors calls for bookbinders capable of ministering to such a taste, that such artists as Zaehnsdorf, Rivière, Fazakerly, in Liverpool; Birdsall, in Northampton; Chivers, in Bath; F. Sangorski, G. Sut-

cliffe, de Sauty, and a constantly increasing number of women workers, should arise. The characteristics of these and other binders working in England are discriminatingly set forth in much interesting detail by Miss Prideaux in her present volume. Book collectors have always turned to France as the place where the finest bookbindings are produced, and the praise of modern French bookbinders that found a place in her former volume, to which reference has already been made, is, in *Modern Bookbindings*, continued and amplified. She writes particularly about Michel, Mercier, Gruel, Ruban, Canape, Lortic, Carayon, Thouvenin, Simier, Capé, Chambolle, Duru, Trautz, Cuzin, Roche, and gives an exceedingly intelligent idea of the attainments and limitations of each of these binders and some others. The book concludes with certain notes on edition binding which is based on machine work in the place of hand work, and treats of the solution of problems connected with mass instead of individual craftsmanship. The book is copiously illustrated and appears in an edition binding.

Organized Democracy. By Albert Stickney. Boston: Houghton, Mifflin & Co. $1.00.

Any one who has taken up Mr. Stickney's book with the expectation of finding in its pages a carefully worked out theory for the organization of democracy will be disappointed. He has a few generalities, often repeated, on what should in his opinion be done properly to organize democratic government in America. His principal propositions are the following: Administration must be single-headed; supreme political control should be in the popular assembly, and the assembly should be the organ for forming popular judgment. Fixed terms for office should be abolished, so far as administrative offices are concerned. Voting by ballot is to be done away with, and we are to return to the viva voce town-meeting form of government, for, as he naïvely remarks:

"It is only the disreputable candidates who will lose by the process of viva voce voting. No man is ever deterred by publicity from voting for men who are reputable and respectable. Secrecy in voting is needed only by men who are ashamed of the quality of their actions. Secrecy is a protection only for actions which should not be protected. Every citizen can keep his own count of votes. False personation, fraudulent registration and fraudulent voting are all made so difficult of execution and certain of detection as to make their abolition nearly certain. The citizens who live in any one neighborhood will meet together."

The city reader who does not know his next-door neighbor by name, or perhaps even by sight, will be inclined to smile at the delightful simplicity of the suggestion of the writer that these neighborhood meetings can be panaceas for election frauds. The suggestions of reform are for the most part fragmentary and not sufficiently worked out to give the reader any adequate conception of their value or lack of it. Space which might better be devoted to expressing clearly in more detail the methods of reform proposed are devoted to panegyrics of what their adoption would accomplish.

Freedom in the Church. By Alexander V. G. Allen. New York: The Macmillan Co. $1.50.

It is freedom in the Episcopal Church which Professor Allen has especially in mind, and recent discussions over the doctrine of the Virgin Birth have called forth his plea for liberty. His interesting and timely volume is largely occupied with showing that we use the Apostles' Creed in quite a different sense today than that in which it was held by those who wrote it and first employed *it* in divine service. That this is true is no longer open to question. The creed was written to bear witness to the real birth of Christ, rather than to his miraculous origin, and it was directed against the gnostics, who denied the proper humanity of our Lord. In placing emphasis on the supernatural character of the birth, Professor Allen claims that we have gone off on a wrong track, tho he does not himself question the Virgin Birth as a fact of history. Our modern emphasis on the origin of Jesus he declares to be a projection of the natural into the spiritual order, which can lead only to disaster. This historical study of the original meaning of the creed is made the basis of an appeal for liberty within the Church for those who are in sympathy with the truth to which it was intended originally to bear witness, but who find themselves unable to accept

every statement of the creed as commonly interpreted. This common interpretation Professor Allen insists is not binding upon the historical student who employs the creed in public devotion.

"The opinion of the man on the street has but little value on the question of the interpretation of the Creeds. The subject is too subtle, too complicated; it involves also the possibility of real meanings, and apparent meanings, of unconscious modifications, under the influence of the spirit of the age, which is forever changing."

We would commend this involved and subtle argument to our friends in non-liturgical Churches who are doing their best to shackle themselves with chains which those who wear them find so troublesome. When it is observed what pains men are put to in order to defend their liberty, imperiled by the clinging hold of the liturgies of the centuries, there may be less haste to rush into the same difficulties. If, however, in the days to come the descendants of Cromwell and Jenny Geddes find themselves embarrassed with formularies and practices they would fain be rid of, we trust devoutly they will find a friend of the wit and learning exhibited in this volume to help them regain their old-time liberties. A reply to this book from a high church standpoint has been written by the Rev. George B. Johnson, chaplain to the Bishop of Vermont, and published by Longmans, Green & Co., under the title "Freedom Through the Truth." (Paper, 30 cents.)

The Profit of Love: Studies in Altruism. By A. A. McGinley, with Preface by Rev. George Tyrrell. New York: Longmans, Green & Co. $1.50.

Is the world growing in love as well as in knowledge? This is the fundamental question dealt with in the present volume of essays on human love and its relation to our common daily experiences. The answer to this question, thinks the author, is the best index to the real progress we are making toward the solution of those crucial world problems which in times of social unrest like our own, fill men's hearts with vague apprehensions of impending struggles between the members of the great human family. The ever-growing interest shown by thinking men and women of the present day in the educational and social problems which have been forced upon our consideration by the great changes wrought in the scientific and economic world, is to the author one of the encouraging signs of the times, and he is gratified to perceive that the trend of thought in the minds of those who discuss most seriously and independently the means of bettering conditions in a world where there is still so much darkness and misery, is distinctly spiritual and Christian, standing in marked contrast to the radical and materialistic ideals of certain would-be social and industrial reformers. The dedication of the series "to my neighbor" is significant, and the aim of the author thruout is to show from a study of the elementary laws of natural growth that the trend of all human progress is toward universal brotherhood, enlightened and sustained by a supremely dominant altruism rather than by man-made laws. Present struggles between man and man and class and mass are but a perverse and unnatural resistance to this inevitable trend. The ever multiplying relations and inter-relations of interests in the human family are bound to make us brothers—Jew or Gentile, bond or free—whether we will or no. The book is deeply spiritual, but it does not belong to the conventional, and still less the conventual type of such writings. It deals with principles rather than with their practical application, tho many useful hints in this direction can be easily gathered by way of inference. Certain accepted educational and religious notions are called in question with a frankness which, while it may alarm the timid, cannot fail to prove stimulating to the thoughtful, and for these alone the book is intended.

Our Constitution. By Edward Waterman Townshend. New York: Moffatt, Yard & Co. $1.50.

What Mr. Townshend has set out to write is a story of the origin and development of our National Constitution, giving its history, and in some of the more important particulars the construction placed upon clauses of it by the courts. It is written simply and its purpose is obviously the instruction of

lay readers. The historical part of the book, so far as it relates to the colonial events thru which the Constitution was evolved, is fairly well done, tho it suffers in contrast with Mr. Fiske's "Critical Period of American History," which covers the same ground. This, however, is but a part of the scope of Mr. Townshend's book. It also includes an excellent commentary on the Constitution itself, taken clause by clause and clearly expressed in simple language. In the chapter entitled "Some Important Inspirations" the writer has made a useful collection of extracts from the texts of a large number of the charters of rights which had influence in the formation of the Constitution itself. The book suffers from the lack of an adequate index. References to historical, and perhaps occasionally to legal, authorities would have made it more useful as an introduction to the study of the Constitution. As a whole, however, the book should be of service, as it is clear, compact and expressed in a fairly interesting manner.

Jerry, Junior. By Jean Webster. New York: The Century Co. $1.50.

There are many Americans who have lived as long as the author has in the pretty little town of Valedolmo, at the foot of Monte Baldo, overlooking Lago di Garda, and have seen as often the Luini in the chapel of San Bartolomeo. All such, and we are sure many less traveled persons, will enjoy this light and summery story of a flirtation *en masque*. The course of true love runs perfectly smooth, and the reader is never for a moment distressed by any unpleasant incident or worried lest everything should not come out right.

Pebbles

A SUGGESTION THAT CAME TOO LATE.

LADY—Today I am thirty years old. Oh, why didn't my parents postpone their wedding for ten years!—*Fliegende Blätter.*

ON a trip last week a car axle broke directly under Secretary Taft's seat. He had not long ago given up the attempt to reduce his weight.

"I'M afraid your children don't have much pleasure."

"Well, I don't know. They are allowed to walk in the graveyard every Sunday."—*Life.*

CROKER.

"I'M out of politics," says Dick—
"Clean out, and long have been."
Perhaps he may be clean when *out;*
He wasn't clean when *in.* —*Puck.*

DISCONCERTING.

"Now, boys," said the schoolmaster, "what is the axis of the earth?" Johnny raised his hand promptly.

"Well, Johnny, how would you describe it?"

"The axis of the earth," said Johnny proudly, "is an imaginary line which passes from one pole to the other, and on which the earth revolves."

"Very good, exclaimed the teacher. "Now, could you hang clothes on that line, Johnny?"

"Yes, sir," was the reply.

"Indeed?" said the examiner, disappointed; "and what sort of clothes?"

"Imaginary clothes, sir."—*Journal of Education.*

THEY had all been to church, and the young minister was coming home to dine with them. While at dinner they were discussing the new stained glass window a member had given them.

"It is a most beautiful piece of workmanship," said one, "and must have cost a great deal of money. Do you have any idea how much?"

"I really do not," replied the minister; "but it's far into the hundreds, I should imagine."

"No, it didn't, either," said little Harold. "I know how much it was. It cost fourteen shillings and tenpence."

"Why, Harold, how do you know anything about it?"

"Because, mamma, it said at the bottom of the window 'Job 14-10.'"—*Mystic Times.*

APOLOGY TO THE JUDGE.

WHEN John Scott (Lord Eldon) was at the bar he was remarkable for the sang froid with which he treated the judges. On one occasion a junior counsel, on hearing their lordships give judgment against his client, exclaimed that "he was surprised at such a decision." This was construed into contempt of court, and he was ordered to attend at the court next morning.

Fearful of the consequences, he consulted his friend, John Scott, who told him to be perfectly at ease, for he would apologize for him in a way that would avert any unpleasant result. Accordingly, when the name of the delinquent was called, John rose and coolly addressed the assembled tribunal:

"I am very sorry, my Lords, that my young friend has so far forgotten himself as to treat your honorable bench with disrespect. He is extremely penitent, and you will kindly ascribe his unintentional insult to ignorance. You must see at once that it did originate in that. He said he was surprised at the decision of your Lordships. Now, if he had not been very ignorant of what takes place at this court every day—had he known you but half as long as I have—he would not be surprised at anything you did."—*Tit-Bits.*

Receivers for Trusts

In that part of the Government's complaint against the Tobacco Trust which asks the court to hold that the parent corporation and each one of five prominent companies controlled by it are unlawful combinations, application is made for a restraining order, "or, if the court should be of the opinion that public interests will be better subserved thereby," for the appointment of "receivers to take possession of all the property, assets, business and affairs of said defendants and wind up the same."

This novel proposition appears to have been suggested by the negative results of legal proceedings against certain great combinations. Receivers are usually appointed upon the application of persons financially interested in the corporation or firm whose condition is under consideration, and for the protection of creditors and stockholders. The public is familiar with the procedure in bankruptcy cases. The tobacco corporations unquestionably are solvent, and receivers are suggested because the Government's representatives think that perhaps only by use of them can the court's order be enforced, further violation of the law be prevented, and competition be restored. We assume that the court has power to appoint receivers as suggested, but we are inclined to think the power will not be used.

Let us suppose that the Government's allegations in this case are fully sustained by the evidence. The law then points to other courses of procedure which are to be preferred. This group of corporations constitutes a great business undertaking, capitalized at hundreds of millions of dollars, and its securities are widely distributed. We are not defending or making excuse for the practices of which the Government complains. But for violations of the law there must be some better remedy than action which would, in a business sense, wreck this organization and cause loss to thousands of innocent investors. There must be some better way to enforce the orders of the court, if such orders as the Government seeks should be issued. It would not be easy to find persons properly qualified for these receiverships. The appointment of them, to say nothing of their subsequent action, would cause a great decline in the value of all the securities directly involved, with a sympathetic fall of hundreds of other securities in the general investment list.

What would be the functions of these receivers? Mr. McReynolds, the Special Assistant Attorney-General who has "charge of the case, remarks that they might sell off the various factories to independent concerns." Assistant Attorney-General Purdy says that their duty would be "to dissolve or separate the component parts of the monopoly and cancel whatever illegitimate contracts or arrangements may exist." What does the complaint say? What is the function of the receivers, as specified in the Government's application? "To take possession of all the property, assets, business and affairs of the defendants and *wind up the same.*" But would it be necessary, expedient, wise or just to wind up the affairs of these great corporations? We think not. Not equitably could the property be disintegrated and sold in parcels to independent concerns or other possible purchasers.

Of course, the receivers would not seek profits for the corporations by continuing to violate the law. Some years ago the Whisky Trust came into the hands of a receiver who did not stimulate competition among the component parts of that combination, but coolly continued to fix and maintain prices by agreement with independent manufac-

turers. The receiver of the Cleveland & Marietta Railroad Company sought to increase the receipts of that corporation by a memorable contract with Standard Oil interests, the purpose of which appeared to be the ruin of the late George Rice. Such things have been done by receivers. In this case it is intended that they shall take a very different course. We presume that it would be pursued honestly and in obedience to law, but it would cause great loss and be unjust to many.

The appointment of receivers for the tobacco corporations must be based upon evidence that would be sufficient to convict the corporations and some of their officers of violations of the law. Why, then, should not the Government use this evidence in criminal prosecutions? The statute says:

"Every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several States or with foreign nations, is hereby declared illegal. Every person who shall make any such contract or engage in any such combination shall be deemed guilty of a misdemeanor, and on conviction thereof shall be punished by a fine not exceeding $5,000 or by *imprisonment not exceeding one year,* or by both said punishments, in the discretion of the court."

Why does not the Government test the efficacy of imprisonment? With this provision of the law before their eyes, why do the officers of the Department of Justice suggest the appointment of receivers? They virtually say to the managers of the Tobacco Trust: "You are violating the law shamefully, but we shall not seek to have you pay the penalty which the statute prescribes. We shall ask the court to restrain you by its order, and if you do not obey we shall ask for receivers to sell your property."

"Every contract," the law says. From the beginning to the end of the complaint filed last week there is talk of unlawful contracts. Reference is made to two written ones, which appear to have fallen into the Government's hands. These contracts must have been made and signed by somebody. Why not prosecute criminally the makers and signers of them, if the allegations of the Government as to the oppressive and wicked practices of the combination are true? Mr. Purdy says the receivers would cancel the unlawful agreements. Why should not the Government cause them to be canceled by sending the makers of them to jail?

We are not saying that the Sherman act is a perfect law. That is another matter. But if that act is to be enforced, its penalties should be inflicted directly upon those who, under its provisions, deserve punishment. Lawbreakers in jail are a more wholesome sight than thousands of innocent investors suffering loss by reason of a resort to receiverships. z

The Filipino Indifference

Not a little surprise and regret are expressed that so small a number of qualified voters registered in the Philippine Islands for the election of their first Legislature—only 6,700 natives in Manila. We are not surprised at the apathy. What more was to be expected of a people who have been invited to take part in a political function that is new to them, and whose importance they cannot be expected fully to understand? When we remember how few are the voters that go to the polls in some of our own States for a Congressional election we may excuse the Filipinos.

But we have a lesson in American history which it will be well to recall before we blame the indifference of the Philippine people. Do these complainants remember the history of our own first Congress? It may be well to recall some surprising and not very pleasant facts.

The convention which framed our Constitution adjourned September 17th, 1787. Three days later it was presented to the Continental Congress, which referred it to the States for adoption. It was by the narrowest vote in Massachusetts, Virginia and New York that the Constitution was ratified, and it was not until July 26th, 1788, that New York, the eleventh State, added its approval, the vote standing 30 to 27. Even then Rhode Island and North Carolina refused to join the Union.

Meanwhile the new Congress, elected under the Constitution, was to meet in New York, March 4th, 1789, to count

the electoral votes and inaugurate George Washington and John Adams as President and Vice-President of the eleven States. It had been impossible to keep together the members of the Continental Congress, at times less than half a dozen being in the city. It was truly a Rump Congress, and it was as difficult to get together the new Congress. It seems incredible, but it is a fact, that on the 4th of March only eight of the twenty-two Senators were on hand and only thirteen of the fifty-nine Representatives. There was no quorum, and all they could do was to adjourn from day to day. There was no quorum of the Senate until Richard Henry Lee arrived, the twelfth of the twenty-two, on April 5th, more than a month later. On the 11th of March the Senate had sent a circular letter to the absentees urging their immediate presence in New York, and it sent out a second similar letter a week later.

At last there was a quorum of both Houses, after most provoking delay, and the electoral votes were counted and George Washington was declared President and John Adams Vice-President. But New York's vote was not counted, because her Legislature had neglected to choose Electors! Her Senators did not attend the inauguration. On April 7th, the next day after the electoral votes had been counted, messengers started to inform the President and Vice-President of their election; and it was not till April 30th that they could arrive and be inaugurated, and the first Government of the United States was installed—so slow, so derelict had the people of the United States and their chosen legislators been.

Why, then, should we be surprised if these Filipinos, who have never learned self-government, who had not past thru a Revolutionary War, who had not had the experience of a Continental Congress, who had not framed a Constituion, are a little slow in taking up the duties of voting citizenship? We are not sure but they have done fairly well; at any rate it is hardly for us, who revere our ancestors, to feel discouraged because they are so dilatory, so unappreciative of their privileges of self-government. It takes time to create a sense of new political responsibility.

American Historical Pageants

It will occur to any one who reads the two articles in this issue describing the historical celebrations at Oxford and Jamestown that the English have been more successful than we in contriving a method of revivifying the past. In justice it must be considered, of course, that there is no spot of ground in the New World and few in the Old so rich in historic and literary associations as Oxford. But we are not so young as we think we are, and we do not make the best use of what material we have. Two-thirds of the scenes enacted at Oxford come within the chronological scope of American history.

The three Spanish caravels, the "Pinta," "Nina" and "Santa Maria," looked strangely out of place on the lagoon in Jackson Park, Chicago, but they did more than any number of books and speeches to make people realize what a venturesome and courageous spirit it was that sent them across unknown seas to an undiscovered country. Suppose that once a week at Jamestown the crowds gathered on the sand dunes of Cape Henry could see the three ships under Captain Newport enter the bay and make their first disastrous landing, and then could follow them in excursion steamers and motor boats up the James and watch the starting of the settlement on the island, afterward adjourning to a convenient glade in the forest, where the Pamaunkee Indians could act out the condemnation and rescue of Smith by their ancestors with a picturesqueness and vividness impossible in a stage performance. Would not that be a more appropriate and effective way of teaching history than by monuments and addresses, or even medals, stamps and post cards? And would it not be a more attractive feature than most at the Exposition?

Such a pageant would probably pay for itself in the incidental expenditure of the spectators. If not, an appropriation from the Government to help it out would be more legitimate than some of the appropriations have been. The Government did appropriate $10,000 for a reproduction of the battle between the "Monitor" and "Merrimac," but that has

been given up, we understand. Probably it is just as well that it should be. A representation of the actual event celebrated by the Exposition would be more fitting and interesting. Let the Smithsonian go a step farther and translate into life the twenty-two life-size figures of the historical group that we illustrate on another page.

All our anniversary celebrations could utilize the historical pageant to advantage. Two years from now the "Crescent," under Henry Hudson, should again sail up the river as she did three hundred years before. In 1923, the quarter millenium of the exploration of the upper Mississippi, Marquette and Joliet should launch their two birch bark canoes at "Sainte Marie du Saut," and go thru the lakes, down the Wisconsin and the Mississippi, stopping on their way back to see how Chicago has grown since their first visit. A few years later it would be time to re-enact the exciting travels and adventures of La Salle and Tonty. By 1939 we will have the four hundredth anniversary of De Soto's discoveries, and this will attract tourists and their money to another section of the country, to the chain of local celebrations stretching thru the South, from Tampa Bay to New Orleans. In arranging the Coronado expeditions in the following year it will be necessary, in order to prevent local jealousy, to divide the troupe, as opera companies do when they go West, for the mysterious cities of Cibola have become seventy times seven in the last four hundred years, and almost every town west of the Mississippi and south of the fortieth parallel claims to be the only genuine Quivira.

The American people are fond of parades and spectacles, and will accept any excuse for an excursion. The spirit of local patriotism is developing rapidly, West and East, and only requires to be wisely directed to produce pageants that will be artistic as well as instructive. Any past is romantic and picturesque if it is only far enough back, just as any mountains are blue and delectable when seen from a distance. Already the red stage coach and the white camp wagon are strange enough to be interesting. The Pioneer Days, Old Settlers' Reunions and Wild West Shows now common in towns scarcely a generation old are spontaneous attempts to catch and perpetuate phases of cowboy and mining life that have only recently become obsolete. Some of the Western celebrations, like Potato Day at Greely, Melon Day, at Rocky Ford, and Corn Day at Atchison, are literally autochthonous, and show an admirable impulse to idealize everyday occupations and make the most of brief traditions. It will not be many years before free land is as rare as free gold, and then Oklahoma will find its Eighty-niners as romantic and interesting as California now finds its Forty-niners.

The open-air spectacle is especially suited to our climate and tastes, and there is a possibility of developing it into a native art if generations of local actors, musicians and dramatists work upon the same theme. If a place lacks history let its inhabitants invent legends, and by repetition stick them onto its scenery. Every village could become an Oberammergau, with its patriotic Passion Play.

Bishop Satterlee's Convention Address

Dr. Satterlee, the Episcopal Bishop of Washington, gave the more important part of his address before the late diocesan convention to the Church's duty to the colored race. It is to his honor that he recognized the prime importance of this duty.

He admitted that his Church does not have the confidence of the negro, and he gave no explanation of the fact, but his address itself would afford an explanation if the Bishop is a fair representative of it. It was thruout a reiterated assertion of essential and inevitable racial inferiority.

Now, nobody likes to be told that, even if it is true. Our Declaration of Independence says that all men are created equal, and that sounds flattering and hopeful. We like to hear it. Bishop Satterlee's first sentence says that here are ten million people "belonging to a weaker race." We know no evidence of that. He goes on to say that "the presence of a subject race in the midst of another people" has always made trouble, altho Christianity has gradually, in the

past, removed dissensions "between subject and superior races." The early Church, he says, "never came in contact with the negro, and had to do with much stronger races of men." He proceeds to assume:

"We have to help elevate a race which is morally and intellectually weaker than the Greeks and Syrians, Egyptians and Gauls of Apostolic days, or the Goths and Vandals of Medieval times."

We imagine that will not be very seductive reading to Prof. Kelly Miller, of Howard University, or the Register of the Treasury; and he goes on to rub in this inferior condition, for the negro problem, he says, has been greatly complicated by this fact:

"To prevent the negro from being a subject race, the country has given them the right to suffrage, making them the equals of the whites when they are not their equals."

So he would have the Fifteenth Amendment rescinded—tho he does not need to say so in terms—but his attack on negro suffrage and the Constitution will not placate the negro spirit.

That the negroes are trying to rise and make themselves the worthy equals of white people he sees, but it will be a sure failure, for he says:

"At the present day the colored people of America are led astray by mere delusions as to the way in which the difference between a stronger and a weaker race may be overcome.

"The most ignorant of them think that by standing for their political rights as 'fellow-citizens,' they are going to coerce recognition as social equals, and, therefore, many of these act with blatant self-assertion and an assumption of equality whenever the opportunity offers in public or private. Others dream that they will break down the color line by becoming householders; and, therefore, are buying up all the land they can pay for; others suppose that they can attain the same object thru the possession of wealth; and others still aim for equality by being educated in schools and colleges, entering upon the learned professions and having university degrees attached to their names.

"But no stream can rise higher than its fountain head, and the history of the negro race in the past forty years is a great historic lesson. Tho, for more than a generation, the negroes have been made the political equals of the whites by universal suffrage, the result has only brought out, more plainly than ever before, the fact that they are morally and intellectually a weaker race, and that, even if they should become great landowners, men of wealth and men of education, race antagonism would only become stronger and more sharply defined."

Let us say to Bishop Satterlee that he is as ignorant of the negroes as he confesses he was, until lately, of the Methodists. The colored people of America are not concerned at all about social recognition, only about their equal personal rights. They do not admit that they are intellectually or physically inferior to any other race; they are only a little later in getting started. They have an ambition, a reasonable one, which we shall do our best to support, that in intelligence, culture, wealth and genius they may prove themselves equal to the best the world has yet produced. We expect to see men of that blood occupying the highest positions in this country, all conceited and arrogant Caucasian or Anglo-Saxon assumption and resistance to the contrary notwithstanding. We want to see it; it is decently Christian to desire it. We believe that a succeeding generation will see great black republics in Africa, producing statesmen, philosophers, poets and orators worthy to be counted beside Homer and Plato and Cicero and Dante and Shakespeare. Equally we expect such great leaders to appear in regenerated Russia. These hopes are no more fantastic than it would have appeared to Roman Senators to see the Angli slaves become *angeli,* or to Cæsar that the race of which he sold 63,000 slaves should produce in Napoleon a mightier conqueror than himself.

A Great Refusal

DURING the next six weeks one of the most important problems that will occupy the attention of those who are philanthropically inclined will be the mortality among city children. In spite of all our improvements in sanitation and in spite of all the money that has been spent in improving the condition of the poor and ameliorating health conditions in the crowded portions of cities, the death rate among children is little short of appalling. In our cities in this country the average number of deaths under five years of age is probably one in six. This is a great improvement over the times not so long ago when one in three perished in early life, in large cities, but still it is so far from what might be

hoped for as to make us look anxiously for the reasons for it. How much environment has to do with infantile death rate may be appreciated from the fact that the death rate is scarcely more than one in ten in rural populations and even less than this where the communities are reasonably intelligent, while it rises to nearly one in five for urban population, according to the statistics of the last census.

It used to be thought that the death rate among infants was inevitably high. Somehow it was considered that many children were not born with sufficient vitality to carry them over the first years of life, and that a large number of deaths was more or less to be expected because of natural exhaustion of vitality, or at least failure to present enough vital energy to overcome the ordinary obstacles likely to be met with in life's path. This idea has, however, been practically entirely abandoned. The causes of deaths among infants are well known, and most of them are quite avoidable. Various forms of contagious disease, which develop readily in infants weakened by unsuitable feeding, and lack of proper care, these and not any cause in the nature of things bring about the high early death rate which is such a constant feature of the mortality tables all over the world. Careful study has been devoted, therefore, to the various causes which bring about this high death rate with the idea of eliminating them. In recent years there has developed a growing realization that, while many factors that greatly increase infant mortality are being eliminated from the problem, and the effect of such elimination can be distinctly seen, another factor has come to enter the equation with an unfavorable aspect, a strongly negative sign, that is unfortunately spoiling much of the amelioration of conditions brought about by the careful study and eradication of other causes of infant mortality.

This prominent factor is the refusal of mothers to nurse their children. Of course it is well understood, and readily admitted by all, that it is impossible for all mothers to nurse their children. A certain small proportion of them cannot do so without exposing their children to serious danger for lack of sufficient nutriment of the proper kind, or because the drain upon their own health would be too great to justify the risk involved, and this would eventually react upon the health of their children. It may be set down at once, however, that four-fifths of the mothers can nurse their children if they wish to, and this is a plain duty. No method of feeding children that has ever been invented, no matter how elaborate or how thoroly scientific, has ever supplied a food that makes up even to a measurable degree for mother's milk. This is not only a good food in general, indeed the best possible food as a rule, but it is specifically calculated by nature to supply just that form and character of nutrition that the particular infant requires. The child has been for many months subsisting on the tissues of its mother, and the special metabolism which supplied this thru the blood stream is now all directed to supplying corresponding nutriment thru the milk ducts.

With the progress of education, or at least of that peculiar state of mind that has come with the spread in recent years of the ability to read and write, more and more mothers refuse to nurse their children. The statistics in the matter for the city of Berlin are available for the last fifteen years, and they throw a startling light on modern social usages. At the time of the census of 1890 it was found that out of every 1,000 children born during the preceding five years, 529 had been nursed by their mothers. This is scarcely more than one out of every two, and is certainly not as much as would ordinarily be expected. In 1895 the number had dropped to 446 out of every 1,000; that is, nearly one-fifth less children now had the advantage of their proper food during the first year of life. During the next five years a still more serious drop in the number of nursing mothers took place, and only 332 out of every thousand mothers who had had children during the preceding half-decade were reported as having nursed them. Less than one out of every three children went thru life during that first hard year unhandicapped by having to take artificial food.

One would think that it was scarcely possible for the situation to become any worse than it was reported in 1900. The statistics for 1905 are not yet available. According to Dr. Paul Mayer, writing in a recent number of *Die Woche* of Berlin, the actual figures will, according to information privately received, show an even greater decrease than during the previous five years. This means that probably not more than one out of every four children are now being nursed by their mothers in the German capital. German mothers are usually considered to be more willing to fulfill this obligation than the mothers of most other countries. It would be almost heart-rending to think that mothers in our American cities were as neglectful of a simple duty as this. It seems not unlikely, however, that conditions in our large cities are not much better, if they are not actually worse, than those thus reported in Berlin. We have no statistics to guide us in the matter, but it would seem as tho the collection of such statistics might furnish very precious information as to one great cause of infant mortality.

Dr. Mayer calculates that a woman who can nourish her child, but does not, increases the danger of death for the infant from various preventable diseases at least five times what it would ordinarily be. It becomes evident, then, that the mother who is resolved beforehand not to nurse her child is scarcely justified in having the child at all. While the danger of death is greatly increased, physicians appreciate that many affections which cause suffering or untimely mortality in adult life have their origin in infectious diseases of various kinds which readily find opportunity to develop in the run-down and weakened conditions of artificially-fed children. Here is the great refusal of plain duty that the modern mother makes. It is evident that a proper sentiment will have to be created in order to have women see their duty plainly in this matter, for at the present time the dictates of fashion are all against the likelihood of more mothers assuming this precious duty toward their children, and the future is dark with the prospect of an unnursed race with the many evils that that portends.

After the Commencements

MANY serious people are asking serious questions: What kind of students go to the American universities? What do they do while there? What kind of men come away? Is the university a "place where pebbles are polished and diamonds are blurred"? Is a real man hindered more than he is benefited by his four years of undergraduate study?

The first significant fact to be observed in certain large universities is that outside interests are primary and university work proper is secondary—from the standpoint of the student. Athletics and social affairs of different kinds demand so much time, and the students keep such late hours, that they are unable to do good work, even when they have any desire to do so. One instance will illustrate: A professor of national reputation gives a course during the year to seniors. A large number of the class have been absent as much as one-third of the time. A much larger number have failed to do the assigned reading and to take the work at all seriously. A student who shows his interest either by asking questions or answering them is laughed at. The student prominent in university life is not often the one doing good classwork from day to day, but is a member of one of the many athletic teams, debating teams, or is prominent in fraternity circles for some reason entirely apart from good scholarship. The professor mentioned above remarks that he does not object to play as such, but does object to making play the primary object of college life.

Not a few fraternities are an evil. They foster idleness, false and abnormal attitudes toward work and life. They breed all sorts of immoral life and practice. They are reputed to foster college spirit, but it is not a spirit that will do a college any good. In some cases the spirit manifests itself chiefly in noise, drunken carousal, fighting policemen and breaking out car windows. During the past year many drunken, disorderly students have been arrested and fined in the city courts. The final banquet of one of the upper classes was a drunken brawl. Pandemonium reigned; dishes and arti-

cles of food were thrown about. They are not all drunkards, of course. But certain fraternities are largely responsible for the attitude that sanctions such practices.

These are serious charges, but any one acquainted with the facts knows that the charges are largely true. Who is responsible? No one, perhaps, in particular. The wrong people are at the university. A great part of the time at the university certainly is spent in "polishing pebbles." Too many of the students are *sent* there. They do not know what manual labor means. If they were sent to the farm and workshop and compelled to work, and in their places were put serious, hard-working boys from the farms, the university and society would certainly be benefited by the exchange. The blame for existing conditions is not to be attributed to the university faculty. No one laments conditions more than the members of the faculty; no one tries harder to change conditions. In one respect, however, university authorities are to be censured. They are always striving to increase the attendance, as if great numbers make a great university. The authorities yield to the demands of students, in a desire to keep their good will. Even a university professor, in his desire to have his lectures well attended, may be slow in giving expression to his real convictions concerning the management of university affairs. As a rule, however, the faculty does well with the material at hand, and in view of the present educational situation in this country can hardly be blamed for the weakness of its members just mentioned .

The fact is, as mentioned above, that a large number of the students at the university have no business there. They will derive no benefit from a college education. The only thing that can save them is good, hard work, preferably manual labor—something many of the students have never known. The trouble is our system is wrong. Few people should be *sent* to college. Young men who are ambitious, have a serious purpose, know what they want, know why they are going to college, should perhaps have financial help from their parents or from society, for it is in the interest of society for such people to be educated. With such an entrance requirement and with the intercollegiate games abolished, the university would be a pretty desirable place for young men. Even as it is, it is the place for the young man of genius if he is old enough for his character to have been firmly molded. The inspiration of the great scholars in the faculty, the laboratories and libraries are of inestimable value to the young man preparing to spend his life in the search for truth.

Infelicities of Government

It is difficult to make foreign nations understand why the Government of the United States, to which their envoys are accredited, should not be able to protect their citizens residing here. It has to be explained over and over again that ours is a dual form of government, in which the President of the nation has certain powers, while other powers are reserved for the States, and with these the National Executive has nothing to do. But if Italy, or Japan, says: Then we will go to Louisiana, or California, for redress and, if refused, take action there, the President says, No; you have no right to go to the States. We cannot give you redress and nobody can; but we will use our best offices to persuade California to treat your people right, and that is all we can do, and you shall do nothing.

This is a very humiliating attitude for a great nation to be put into, and a very disagreeable and provoking one for other self-respecting nations which feel the need of protecting their citizens. A foreign Power in such a case is tempted to do what Italy did when this reply was given; she withdrew her Legation and broke off diplomatic relations. The logical conclusion is war. What answer could we have made if Italy had said, We accept no such *non possumus*. We deal with *you*, and if you will not give us redress and punish the guilty men, we will do just what we do in case China or Turkey or Morocco fails to protect our citizens. We will bombard New Orleans. To be sure the United States is too strong a Power, and too well dis-

posed, as a whole, to make this cause prudent; but it is true that if we cannot protect our visiting friends from abroad, and see that those are punished who do them wrong, there is a sad flaw in the construction of our Government, or our Constitution, or possibly our laws.

Probably it is, in large part, the fault of Congress. After the mob which slaughtered the Italian citizens in New Orleans, taking them out of prison by violence and killing them, the President asked Congress to enact a law under which those guilty of crimes against foreign citizens could be tried in a Federal court, but no such law was enacted. Our Constitution provides that the Judicial power of the nation "shall extend . . . to controversies . . . between a State, or the citizens thereof, and foreign States, citizens, or subjects." To the lay mind a "controversy" might easily arise over the damage or injury done to a foreign subject by a mob in the case of his death or the loss of his property, just such cases as those at New Orleans and Rock Creek, in which the United States paid damages to Italy and China for the murder of its citizens, or such a case as the last, which has arisen in San Francisco. And it would seem as if a law could be framed under the Constitution by which a United States court could take original jurisdiction to punish those who do violence to a foreign citizen. That no such law has been enacted is the fault of Congress, and this failure leaves the United States in a very humiliating position.

We are not of those who go about bewailing the danger of the Supreme Court paring away the rights reserved to the States. This trouble illustrates the fact that we need more centralization. There is no other nation of the first or second rank in which the hands of the central executive are so much tied as with us. The Constitution has to be interpreted in a somewhat strained way, or, at least, in a way beyond the ideas of those who wrote it, so as "to promote the general welfare," to use an expression which appears twice in the Constitution as its purpose. After more than a century has elapsed it is time to consider whether a general revision may not be called for, by means of a Constitutional Convention. Under Article V it is provided that Congress, "on the application of the legislatures of two-thirds of the several States, shall call a convention for proposing amendments," etc.

Railroads, telegraphs, and all the easy modes of intercommunication, have brought the people of the country closer together and have made far less of State lines. We are one people, and yet a division of powers, written down in a Constitution, is of value; but England teaches us that a nation may be free which is not bothered with questions of constitutional law, but is concerned only with the "general welfare."

Owning the Pacific

It depends on the point of view—and that is the subjective element — what a man thinks about, for example, the possibility or likelihood of war with Japan. It is absurd, atrocious, inconceivable, Admiral Yamamoto and Marquis Aoki say, and so do American lovers of Japan like Dr. Griffis and our correspondent, Dr. De Forest, now in this country, an interview with whom we see in the *Sun*. But here is a French writer, M. Judet, editor of *L'Eclair,* who says:

> "The position in a nutshell is, that both Powers want supremacy in the ocean called Pacific, and, unless one makes up its mind to draw back, a conflict is inevitable."

That editor has no other idea of nations than that of two dogs each of which must have the bone. We think it occurs to statesmen, both in Tokyo and Washington, that the Pacific Ocean belongs to the world and all its people and all its commerce; that no nation can crowd out any other from its waters; that Japan and the United States can just as amicably live on its opposite shores as Italy and France can touch each other on the Mediterranean Sea.

Anti-Wellhausenana

The opposition to the Wellhausen reconstruction scheme of the religious development of the Old Testament is the leading factor in Biblical debate in Germany at present. What

makes this opposition all the more noteworthy is the fact that it comes not from conservative, but from critical circles. Chief among the assailants is the Assyriological school headed by Professor Winckler of Berlin, seconded by Jeremias of Leipzig, and others, representing what is now beginning to be termed "Pan-Orientalism" in the interpretation of the Old Testament, altho the term "Babylonism" is also applied, yet more frequently somewhat derisively. The fundamental contention of the new school is that Wellhausenism is wrong in separating the religious development of the Old Testament from that of the surrounding peoples; because the Old Testament religious ideas and ceremonies represent only one stage in the entirely religious development of the Orient, and the roots of these ideas and ceremonies strike down deeply into the Babylonian soil of the centuries that precede Israel's national existence. Baentsch, of Jena, has written a special book to show that monotheism is not a later product of Israel's religious growth, but existed in many circles of the Orient centuries before Wellhausen credits it to Israel. The title of this book declares that it is directed against the fundamental idea of Wellhausenism, namely, that of development, which is declared to be in conflict with the historical facts, as exhibited by the archeology and the literature of the cuneiform tablets. Recent Biblical literature in Germany is loaded with works purposing to trace the parallels between the narratives and general contents of the New as well as the Old Testament and the religious literature of Babylon. The most notable general work of this kind is that of Jeremias, himself a conservative, who finds in Babylon the soil out of which a large portion of the narratives of the Scriptures grew. Jensen, the Assyriologist, of Marburg, has published as the first volume on the Babylonian epic "Gilgamesh," a book of more than a thousand pages, fantastically finding in the person and career of this Babylonian hero the type even of Christ and his deeds. Adherents of the current school, such as Nowack, of Strassburg, have declared that in view of the facts in the case Wellhausenism will need a revision.

Hunting Mosquitoes Whether you find a thing or not depends largely on whether you know what it is you are looking for. Down in Panama when there is an increase of malaria in any locality Colonel Gorgas does not waste any time in "general sanitary measures." He does not put a stop to the digging, on the ground that turning up the soil releases miasmic gases, nor does he advise the men to stay indoors after dark to avoid exposure to moonshine, to stop smoking and bathe oftener and be more careful in their diet and to keep their minds cheerful and free from worry. He knows that there is a puddle in the immediate vicinity that is breeding anopheles, and he just sends a man out to dry it up. Here is an instance: At the Forty-mile Camp in the Pedro Miguel, where there is an average population of 723 and about five cases of malaria reported to the hospital every week, the record showed a sudden jump as follows:

Week Ending	Cases of Malaria.
March 1st	5
March 9th	14
March 16th	20
March 23d	14
March 31st	13
April 6th	4
April 13th	5

The inspector began his hunt, and on the 10th he found the center of infection in a large old French scow completely hidden by the overgrown jungle. The larvæ in the scow were destroyed, the immediate neighborhood cleared of brush and the houses containing adult anopheles fumigated. At the end of the usual period of three weeks, during which malaria, developed by a given point of infection, maintains its activity, the number of cases dropped to what at present must be called "normal" for this region. When typhoid broke out in the Empire division, causing twenty deaths a month, different tactics were called for, because this disease is not injected thru the skin by mosquities, but enters the system thru the mouth. Accordingly the water supply was cleaned up and all food protected from flies, which carry the infection.

The American Way

One of the ablest Catholic papers in this country thus describes the American policy as to the churches:

"The American State says to the various churches: 'Organize yourselves as you think best. Be democracies or autocracies in your interior constitutions, as you prefer. Follow in your method of government the Congregational, or the Presbyterian, or the Episcopalian plan, as you please. The State won't interfere—it is your affair. You can elect your clergy or you can let your bishops appoint them. Whatever best suits your beliefs, whatever best accords with your history or traditions, you may adopt. We politicians will keep hands off.'"

That is true; and that is, as we read the new laws, just about what the condition will be in France. Before this new legislation the Catholic Church could not provide a bishop or a priest without permission of the Government, whose head might be an atheist or a Protestant. Now the Catholic Church can rule itself as it chooses, and nobody will interfere. It is a blessed relief, and they begin to find it so. There is no interference with worship, and the bishops and priests can hold all the churches as they choose, and keep the laymen out, as their rules require.

Secretary Metcalf is quoted as saying in Omaha that we must soon make more stringent laws to exclude foreigners:

"Some of these people have only $25 or $30, barely enough to escape the exclusion law. They do not assimilate with Americans. There is no development in the man who, drawn here by the hope of higher wages, sends his money home and, after he has accumulated a few hundred dollars, goes back to live in idleness on what is a fortune in his own country."

"Idleness" with "a few hundred dollars"? We guess not. Much more likely they buy a few acres of land and work hard on it. Suppose they do go back; have not they paid well in work for all the money they have received? That is no loss to us. They have created more wealth than they carry away. Then is not their having been here an advantage to their own country when they return; and do they not carry back a ferment of enterprise and intelligence, and is not that worth considering?

We constantly see in the Southern papers articles on the desirability of distributing the negroes, sending them North—where they are coming fast of themselves. We find that just now in the leading journal of Charleston, S. C., and yet when any one tries to distribute them there is a howl; and the last South Carolina Legislature increased the tax on emigration agents from $500 to $1,000, and every effort is made to restrict their work. A man who tries to run off a company of negroes does it at the risk of his life.

We do not yet know how much credence is to be placed in the report that a concerted effort is making among German, British and American Catholics to present an impressive request to the Vatican that the Congregation of the Index be abolished. With the exception of the Russian and Turkish Governments, the Vatican presents the only authority which maintains a bureau for the restraint and prohibition of books.

Our chief weakness, in case of war, now cry out the anti-imperialists, would be the Philippines. At present our chief weakness is at San Francisco. That has made all the trouble. Her colonies are Great Britain's weakness in time of war and strength in time of peace; and her possession of her colonies is her guarantee that she will not go to war with any maritime Power.

The decision of the Texas authorities not to lease convicts any more to work in coal mines and turpentine camps, but to send them only on plantations is one step in the right direction. The whole system is bad, and should be reformed away; but men interested in politics have the contracts and oppose any reform.

We have another Prohibition State, that of Georgia, which has now enacted State prohibition. Previously 130 out of 145 counties were "dry," and it is likely that the law will be enforced generally; but we doubt about Atlanta, where Governor Hoke Smith is chief owner of the principal hotel.

Insurance

What Is an Adequate Life Insurance?

EVERY one now agrees that some life insurance should be carried by every family man as well as by certain others. The women who used to think that insurance on the lives of their respective lords and masters was tempting Providence have within recent years changed their minds, and the co-operative work done by them, in conjunction with insurance solicitors, has eased the labors of many an agent seeking prospects. Rich and poor, the high and low, sinner and saint alike, have their names written side by side on the books of the greater or lesser life insurance companies. The serious question no longer is, "Shall I insure?" but is now, "How much insurance should a man carry?" *The New York Life Bulletin* prints the table which is herewith reproduced, and which sets forth the expectation of life at each age from twenty-five to sixty, and assumes the present insurable value of a life producing an income of $1,000 per annum over and above personal expenses.

If the reader's net income is less or more than $1,000 annually, the problem of ascertaining the insurable value becomes a simple one based upon proportion, and which can very easily be calculated. The insurable values in the table are computed on the assumption that money will earn 4 per cent.:

Age.	Expectation of Life in Round Numbers.	Insurable Value.	Age.	Expectation of Life in Round Numbers.	Insurable Value.
25	39	$19,584	43	26	$15,982
26	38	19,367	44	25	15,622
27	37	19,142	45	25	15,622
28	37	19,142	46	24	15,247
29	36	18,908	47	23	14,856
30	35	18,664	48	22	14,451
31	35	18,664	49	22	14,451
32	34	18,411	50	21	14,029
33	33	18,147	51	20	13,590
34	33	18,147	52	19	13,134
35	32	17,873	53	19	13,134
36	31	17,588	54	18	12,659
37	30	17,292	55	17	12,165
38	30	17,292	56	17	12,165
39	29	16,983	57	16	11,652
40	28	16,663	58	15	11,118
41	27	16,329	59	15	11,118
42	27	16,329	60	14	10,563

If death should overtake you tomorrow, next month, a year hence, have you made proper provision for your dear ones? The logic of this table is that every man should take just as much insurance as he can possibly carry. By way of illustration take the case of a man at age thirty-five, whose net income over and above expenses is $1,000 per annum. His expectation of life is thirty-two years and his insurable value is $17,873. That is to say, if he placed $17,873 at interest at 4 per cent. and drew from this fund $1,000 yearly, it would last thirty-two years and no longer. Therefore such a man at age thirty-five wishing to secure for his family $250 per year for his expectancy must carry $4,500 of insurance; $500 per year, $9,000 of insurance; $1,000 per year, $17,873 of insurance as per table. Is your income adequately capitalized? If not do not put off till tomorrow what ought to be done today. It is far better to attend to this matter of insurance at once. Tomorrow your capital as represented by yourself in any one of a thousand unexpected ways may be either hopelessly impaired or entirely wiped out.

Continental Insurance Company

THE 109th semi-annual statement of the Continental Fire Insurance Company under date of July 1st, shows total assets of $16,867,137.58, and a net surplus of $8,001,894.59. Notwithstanding the fact that the Continental paid California losses amounting to nearly two and a half million dollars gross during 1906 it has, during the past six months, increased its reserve for insurance in force by $241,634.23, and there has likewise been an increase during the same period of $127,960.25 in the premiums written. The Continental has a cash capital of $1,000,000 and a conservative management. The leading officers of the company are Henry Evans, president; George E. Kline, vice-president, and J. E. Lopez and E. L. Ballard, secretaries.

Financial

Promise of the Crops

THE Government's crop report for July 1st, issued on the 10th, was interesting mainly for the reason that it contained the first official statement as to the growing corn. Little change in the condition of wheat was shown, a slight improvement in winter and a little loss in spring reducing the indicated total by about 500,000 bushels, or from 634,974,000 bushels to 634,494,000. Last year's crop was 735,260,970. The harvest of winter wheat is now in progress, and the yield is better than was expected, notably in Kansas. The condition of corn on the 1st was exceptionally low, owing to the backward season. Altho the increase of planted area is nearly 1,400,000 acres, a crop of only 2,560,384,000 bushels is indicated, against an actual yield of 2,927,416,000 last year, 2,707,993,000 in 1905, and 2,467,480,000 in 1904. It may be recalled, however, that the yield indicated on July 1st, 1906, was exceeded by 225,000,000 bushels when the crop was harvested. As the growing plants, this year, are from two tc four weeks late in the Northern States, there is some danger that the crop will be affected by early frosts. Indications promise 973,072,000 bushels of oats. Last year's crop was 964,904,000. The yield of rye will probably exceed last year's, which was 33,394,000 bushels. Potato acreage has been increased. A decline of 5½ per cent. in the tobacco acreage was accompanied on the 1st by an unusually low condition of the growing plants.

Tariff Rates for France

AFTER the new tariff agreement with Germany was completed, France asked for concessions like those which Germany had obtained. Ambassador Jusserand has carried the answer of our Government to Paris, where it is not favorably received, as it offers nothing more than a reduction of 20 per cent. of the duty on champagne in return for the French minimum rates upon a long list of our exported products. France consented some time ago to exact (until August 1st) only her minimum rate on Porto Rican coffee, and now thinks, it is said, that this concession, if prolonged, would be a sufficient return for the reduction on champagne. But our Government does not take this view of the matter. It appears that France cannot profit by those provisions of the agreement with Germany which make export prices the dutiable market value of imports, as she has no special system of manufacturing for export at export prices. Our Government can grant nothing more than the reduction on champagne (which is permitted by the Dingley law), except by new legislation, which means revision of the tariff. All these controversies with European nations suggest the expediency of a revision which shall establish maximum and minimum rates.

....Deposits in the Bowery Savings Bank, of this city, now exceed $100,000,000. The sum of the deposits in all the savings banks of the State of New York is $1,464,950,833.

....The Safety Car Heating and Lighting Company, whose annual dividend for the last two years has been 18 per cent., is about to declare a stock dividend of 100 per cent.

....Charles A. Boody, recently secretary of the People's Trust Company, of Brooklyn, has been elected president of that institution. The capital, surplus and undivided profits of the company amount to $2,700,000.

....The semi-annual report of the H. B. Claflin Company shows that net earning in the first half of 1907 were $454,275, against $353,258 in the corresponding half of 1906. Sales booked on June 30th for future delivery were larger than on a corresponding date in any previous year. This company's reports always excite much interest, as indicating the condition of business.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Tariff Revision

At the President's summer home, on the 17th, tariff revision was the subject of discussion. Among those present were the President, Senator Hopkins and H. E. Miles, the latter representing the Wisconsin Tariff Revision League. The following brief report, published by the Associated Press, is regarded as official:

"Senator Hopkins, on leaving Oyster Bay, said that the conclusion was reached that no tariff revision should be undertaken until after the next Presidential election. 'It would be suicidal to the Republican party,' the Senator added, 'to undertake a revision of the tariff during the next Congress. After the Presidential election I believe it will be the duty of the Republican party to revise the tariff, and that it will be done.' Mr. Hopkins remarked that he believed such an argument would appeal to and be accepted by the Republican revisionists in all parts of the country."

Some think that a general discussion of the tariff question in Congress next winter cannot be avoided. The agreement with Germany, which is opposed by many strict protectionists, will be one text for such a discussion, and the new treaty of reciprocity with Germany (involving, it is said, a reduction of about 20 per cent.) will be another. Moreover, the Democrats will probably insist upon a tariff debate with the purpose of providing material for use in the approaching national campaign. The concessions granted to Germany in the agreement (which is now in force) may be taken to the courts because of a decision of Judge Somerville, of the Board of Appraisers, last week, against the acceptance of certain valuations made in accordance with the agreement's provisions concerning "export prices" as a basis for the imposition of duties.

Mr. Bryan on the Railroad Issue

After the completion of his journey around the world, Mr. Bryan publicly advocated Government ownership of trunk or interstate railways and State ownership of branch lines which do not cross State boundaries. This excited the opposition of prominent Democrats, especially in the South. On the 20th, he published a long statement, saying that Government regulation must first be tried and that there is no desire anywhere to make Government ownership an issue in 1908. In this statement he says:

"Government ownership is not an immediate issue. A large majority of the people still hope for effective regulation. While they so hope they will not consider Government ownership. While many Democrats believe, and Mr. Bryan is one of them, that public ownership of railroads offers the ultimate solution of the problem, still those who believe that the public will finally in self-defense be driven to ownership, recognize that regulation must be tried under the most favorable circumstances before the masses will be ready to try a more radical remedy.

"Regulation cannot be sufficiently tried within the next year. There is no desire anywhere to make Government ownership an issue in 1908. Mr. Bryan fully agrees with those who believe that it would be unwise to turn attention from regulation, on which the people are ready to act, to Government ownership, on which the people are not ready to act. To inject the Government ownership question into the next campaign would simply give representatives of the railroads a chance to dodge the issue of regulation and deceive the public."

So far, he continues, the railroads have been successful in preventing effective Federal regulation, and State regulation has as a rule been restrained by the Federal courts. The new law is inadequate. Railroads profit pecuniarily by both the stoppage of rebates and the prohibition

of passes, "but extortionate rates still exist," and the railroads seek to deprive States of authority and to centralize all regulation in Congress. "The Republican party is as impotent to regulate the railroads as it is to exterminate the Trusts and to reform the tariff." The Democratic party, Mr. Bryan says, must resist encroachments upon the authority of the States; it must insist upon the exercise of Federal power for the regulation of interstate commerce, and upon the exercise by State authority of all the power vested in the States:

"The Democratic party has in three national campaigns demanded effective railroad regulation, while the Republican National platforms have been silent on the subject. The President has partly adopted the Democratic view on this subject, but so far the Republican leaders have resolutely opposed it. The President is helping to educate the people up to the need of railroad regulation, but his party, under its present leadership, is powerless to accomplish this or any other important reform.

"If the Democratic party will clearly and unequivocably demand: First, the ascertaining of the value of all the railroads; second, the preventing of overcapitalization, and third, the reduction of rates to a point where they will yield only a reasonable return on the real value of the roads, it will commend itself, not only to Democrats, but to those Republicans who have been led to study the railroad question."

Prosecution of Trusts

Dispatches from Washington assert that the complaint in the Government's suit against the Powder Trust will be filed this week at Wilmington, Del. As in the proceedings against the Tobacco Trust, application will be made for a dissolution of the combination, and the appointment of receivers for several of the leading corporations will be suggested. The defendants, it is announced, will be twenty-seven companies (including nearly all those which make ordinary gunpowder, smokeless powder or dynamite) and twenty persons. Among these individual defendants will be United States Senator Du Pont and other members of the Du Pont family. It is alleged that the combination has exacted excessive prices from the Government as well as from consumers generally.——In an additional answer to the Government's complaint in the pending suit for a dissolution of the Standard Oil Company (the defendant's exceptions having been overruled), the company makes a sweeping denial of all the charges concerning rebate favoritism, conspiracy, attempts to establish a monopoly, etc.——Indictments against what is called the Theater Trust were recently dismissed in New York on the ground that the business of providing theatrical amusements was neither trade nor commerce, and that therefore the combination was not an illegal one. It is now stated by persons controlling the combination that they are forming a corporation, to be capitalized at $100,000,000, for the purchase of theaters in Europe and other parts of the world, and that these theaters will be conducted by the existing combination in this country. One of the independent managers here, Harrison Grey Fiske, asserts that the aims of the combination have been exclusively commercial, and that it has been a curse to the drama. The projected expansion is disapproved in London by Beerbohm Tree, Sir Charles Wyndham and others.——In the cases of the twenty-three prominent citizens of Toledo recently sentenced to be imprisoned in the workhouse, execution of sentence has been suspended pending appeal to the higher courts.

San Francisco's New Mayor

Dr. Edward R. Taylor, dean of the Hastings Law School, has been elected Mayor of San Francisco by the Supervisors. After Schmitz had been sentenced to be imprisoned for five years, the Supervisors appointed one of their own number, Dr. Charles Boxton, to be Acting Mayor. Boxton had confessed to the grand jury that he accepted a bribe in the telephone case, and after his appointment he testified in court to that effect, in the trial of Louis Glass, vice-president of the Pacific States Telephone Company. His appointment being only a temporary one, District-Attorney Langdon, Mr. Heney and others engaged in the prosecution proposed that a Mayor should be nominated by a convention of thirty delegates, fifteen of these to be chosen by the labor unions and fifteen by the commercial organizations of the city. This proposition was rejected by the unions and by all but one of the commercial organizations. Whereupon the prosecutors selected Dr. Tay-

lor, who, before his election or appointment by the Board, became a Supervisor in the place made vacant by the resignation of Boxton. Then the prosecutors (who had controlled the municipal government by controlling the confessing Supervisors) announced that their attention would thereafter be confined to the trials in court. Dr. Taylor was born in Illinois and is sixty-eight years old. Beginning his life work as a printer, he afterward was quite successful in the practice of medicine, and then became a lawyer. As a member of the Board of Freeholders, in 1898, he framed the city's present charter. He is well known as a member of civic bodies, the author of technical works, and a writer of verse. In national politics he is a Democrat. He promises to be strictly non-partisan as a Mayor, and to use all available power for the preservation of order. Schmitz, now in jail, holds that he himself cannot lawfully be superseded until the judgment against him shall have been confirmed by the court of last resort. Chief of Police Dinan (now under indictment) says he will recognize no one but Schmitz as Mayor. Dr. Taylor will appoint new Supervisors and remove corrupt officers of departments. Schmitz intends to make appointments, and thus there will be a controversy for the courts. When Schmitz was sentenced he abused the judge and gave notice that he should be a candidate for re-election in November. At the trial of Glass, last week, E. J. Zimmer, another vice-president of the same telephone company, refused to testify or to be sworn, and was sent to jail for contempt.

Land Cases

Secretary Garfield, Land Commissioner Ballinger and Forester Pinchot were guests at a banquet, last week, in Portland, Ore., and one of the subjects mentioned in the speeches was the grant of public lands in that State to the Southern Pacific Railroad Company. It has been alleged that the lands are withheld from sale, in violation of the terms of the granting act. Governor Chamberlain said the company had not kept faith with the people, and that the lands ought to be restored to them. It is reported that evidence relating to the matter will be laid before a grand jury.——At Cheyenne, Wyo., on the 20th, in the Federal Court, E. M. Holbrook, a millionaire; E. E. Lonabaugh, a prominent attorney, and Robert McPhilamey were found guilty of conspiring to defraud the Government of coal lands in Sheridan County.——The names of all the persons indicted at Denver, about a month ago, for land frauds are gradually becoming known, owing to arrests made in several cases. Denver newspapers publish the following list of indicted persons residing in Milwaukee, St. Louis and other places who are accused of obtaining coal lands by fraud in Routt County:

Milwaukee: James M. Pereles, millionaire, president of the Citizens' Trust Company, president of Wisconsin Coal Mining Company; Guy D. Goff, formerly prosecuting attorney; Charles T. Hunter, formerly county judge; Henry M. Benjamin, millionaire coal operator; Charles E. Conright, lawyer and vice-president of Citizens' Trust Company; Chauncey L. Jones, lawyer; C. S. Carter, Walter Johnson, Henry J. Wehr.

St. Louis: L. M. Rumsey, president of the Rumsey Manufacturing Company; William Baer, attorney; F. P. Fay, promoter; Charles H. Dodge, Mrs. Anna Dodge.

Allan G. Wallihan, Colorado, naturalist and author of books about animals; Ruth Wallihan Morse, Des Moines, Ia., his daughter; F H. Wallihan, Colorado; John Boyd Wallihan, Colorado.

All these persons assert that they are innocent, and that the Government was not defrauded in the cases cited. The value of the lands in Routt County is said to be $2,000,000.——Marion R. Biggs, convicted in Oregon, has been sentenced to be imprisoned for ten months.

Rate Controversy in North Carolina

Attempts to enforce in North Carolina a new law affecting railway passenger rates have led to a sharp conflict between the Federal Court and the courts and executive officers of the State. This law makes the maximum rate 2¼ cents per mile, and the rate has been from 3 to 3½ on the lines of the Southern Railway, the arrest and conviction of whose agents have caused the controversy. These agents, as instructed by the company, sold tickets at the old rates. Some weeks ago, in response to an application from several companies, Judge Jeter C. Pritchard, of the United States Circuit Court (formerly Senator),

granted an injunction forbidding enforcement of the law by the State authorities until he could ascertain whether the new rate was confiscatory and therefore in violation of the Constitution. Week before last, Judge P. F. Long, at Raleigh, directed a grand jury to indict agents who demanded the old rates. For this he was publicly commended by Governor Glenn, who, in letters to fifteen Superior Court Judges, asserted that the Federal Court had no right to interfere with enforcement of the statute. Thomas Green, the agent at Raleigh, was indicted and arrested. When it became known that application had been made to Judge Pritchard for a writ of habeas corpus in Green's behalf, Judge Long ordered that Green be delivered into the custody of the court. As the writ, if granted, must issue against Judge Long, and because it was said that the Governor would support him in disobeying it, the application was withdrawn. Green was convicted, but was fined only $5, owing to his promise to obey the law. This promise cost him his position as agent. At about the same time, in Asheville, J. H. Wood and O. C. Wilson, agents, were arrested and prosecuted in the police court, where, on the 18th, they were found guilty and sentenced to serve thirty days with the county chain gang. Wood is an Alderman. Judge Pritchard issued a writ of habeas corpus directing the sheriff to bring the two men before him. The hearing on this writ was closed on the 20th. At this writing it is expected that Judge Pritchard will hold that the criminal provisions of the statute are unconstitutional, and will order the release of the men. Governor Glenn and the State judges contend that the law should be obeyed and enforced until the court of last resort declares it to be at variance with the Constitution, and that the controversy should be carried up to the United States Supreme Court on appeal in the usual way, without a resort to injunctions. The proceedings have been marked by much bitterness, and Governor Glenn has promised to support State judges and sheriffs with the militia. A similar controversy has arisen in Virginia, where Judge Pritchard has granted an injunction against the execution of an order from the State Corporation Commission, making the maximum passenger rate 2 cents a mile. It is predicted that this injunction will be disobeyed by the State authorities.——In a statement concerning the recent report on the Harriman railways, Chairman Knapp, of the Interstate Commerce Commission, says: "Whether any of these transactions were in violation of the criminal provisions of the Anti-Trust law, it is doubtless true that Mr. Harriman secured immunity by being called as a witness. It seems to be conceded on all sides that there was no ground for criminal prosecution." Some who comment upon Mr. Knapp's opinion recall the assertions made by Washington correspondents of prominent newspapers, a few days after Mr. Harriman testified, that counsel had purposely avoided questioning him about the San Pedro contract and some other matters in order that he might not acquire immunity as to these transactions.——Owing to the enactment of a two-cent law in Wisconsin, Chairman Barnes, of the Railroad Commission, has resigned.——Railroad Commissioner Colquitt, of Texas, says that the new anti-pass law will cut off $3,000,000 worth of free transportation per annum in that State.

The Situation in Central America

Reports by telegraph from Central America are of all kinds, and it seems impossible to get the truth. Salvador, we are told, expects to be attacked by Nicaragua within fifteen days. From Panama comes the story that Salvador will invade Nicaragua with a powerful army. But President Zelaya's Minister at Washington, Señor Corea, said on the 17th: "There will be no war; the continuance of peace in Central America is certain." It is understood that our Government would be glad to see a conference of the five republics held in Washington, for agreement upon a peace treaty approved by the United States and Mexico. In one report from Washington the unexpected assertion is made that this is what President Zelaya seeks and that his Minister of Foreign Affairs is now asking for it. Fearing Zelaya, and believing that he recently violated the new treaty of Amapala, Salvador and

Guatemala, it is said, oppose the project of calling such a conference. An impression still prevails that Zelaya's purpose is to consolidate the republics and to rule over them in person or by proxy. ——It was officially announced on the 16th in the Chamber of Deputies at Brussels that Venezuela had avowed her intention not to abide by The Hague tribunal's award of about $2,000,000 to Belgian creditors.

The Hague Conference

The third plenary session of the Hague Conference was held on July 13th, but no business of importance as yet has been transacted by the Conference as a whole. The committee on the reception of address of petitions presented a large number of resolutions from various peace associations, religious bodies, etc., of different countries. Count Nelidoff, president of the Conference, expressed sympathy with the aims and ideals of the numerous petitioners, but said that many of them seem to have a misunderstanding of the Powers of the Conference, which was merely occupied with the study of international law, and was certainly not able to control international politics. The report of the Commission on Red Cross Regulations was presented by Louis Renault, of France, and adopted unanimously. It contains no radical innovations, but provides for the immunity of hospital ships duly marked and identified. The Persian and Turkish delegates objected, as usual, to the use of the Cross, the Christian emblem, as an international symbol. Very little progress has been made in the various commissions toward the formulation of international rules, because there are so many reservations and amendments as to seriously weaken and practically impede any action. The proposals for the immunity of property at sea, discussed by the fourth commission, have all been voted down. Dr. Louis M. Drago, of Argentina, in discussing the doctrine which goes by his name, opposed the modified form of it presented by Mr. Choate, which permits the use of armed force in compelling compliance with the decision of a court of arbitration. He argued that as all civilized states had abolished imprisonment for debt, so bond collecting by blockade and occupation should be forbidden in international affairs. The adoption of such a resolution would be contrary to the purpose of the Conference, for it would add another legitimate cause for war. If coercion was permitted after arbitration, the Monroe Doctrine would be imperiled. Spain presented a declaration in which she claims credit for having worked for the admission of the Latin-American states to The Hague, and expresses her sympathy with the doctrine of Dr. Drago. A further discussion of the question was postponed until July 23d. It appears doubtful if Great Britain's proposal for the limitation of armaments will ever be brought before the plenary session. The peace lobby at The Hague, in which W. T. Stead and Baroness von Suttner are conspicuous, loudly express thru their meetings and periodicals their dissatisfaction and disappointment with the futility of the Conference.

Political Disorders in Italy

Signor Nunzio Nasi, ex-Minister of Public Instruction, was arrested July 17th charged with embezzling $500,000 from the State Treasury. Under-Secretary Lombardo is involved in the same charge, and both men are incarcerated in the Regina Coeli prison. Impeachment proceedings were initiated by the Chamber of Deputies, and the trial is being conducted before the Senate sitting as a High Court. Signor Nasi took oath to his innocence before the Chamber and professes to welcome the inquiry as the means of vindication. The people of Sicily are tumultuously expressing their confidence in him. He was elected to the Chamber of Deputies from Trapani after his impeachment, and rioting occurred in many parts of Sicily. At Palermo meetings were held in spite of police prohibition, at which red flags were prominent and shouts of "Down with the Government" were mingled with "Hurrah for the Republic" and even "Hurrah for the Sicilian Republic." Troops attempting to disperse the mob were fired upon from the windows, and in the street-fighting many persons were severely wounded. The Government has declared a state of siege and suppressed telegraphic and telephonic communcation.——A radical

change in the municipal government of Rome is the result of the last election, when twenty-five of the thirty vacancies in the Municipal Council were filled by Socialists, Republicans and Radicals, including many extreme and violent anti-clericals. Five candidates of the Moderate party, formerly in power, were re-elected. Besides anti-clericalism, the chief factor in the campaign was the high cost of living, particularly of house rent, for which the blame is laid upon the landlords and moneyed classes. A new election has been called for, and the Syndic and Junta of the Roman municipality have resigned. A royal commission will administer the affairs of the city until the new election. In the evening of the election day mobs ran thru the streets waving red flags and shouting "Death to the Pope" and "Down with the priest rule." Many priests were beaten and a dozen propaganda students were roughly handled. Since the latter are foreigners, including English, Irish and American students, it may lead to international complication.

Russia

General Alikhanoff was blown to pieces by a bomb while driving thru the streets of Alexandropol from his club to his residence. The wife of General Glieboff, who was with him, and the coachman were also instantly killed. A son of Alikhanoff and a daughter of Glieboff were severely wounded. General Alikhanoff had been marked for slaughter by the Terrorists ever since his ruthless repression of the revolution in the Caucasus, and on May 30th of last year he was badly wounded by a bomb thrown at him as he was about to enter the train at Borjam. He was a native of Turkestan, by name Ali Khan before his Russianization. He took an active part in the Russian operations in the Russian advance toward Herat in 1884-5, which aroused the apprehension and enmity of Great Britain against Russia. Two years ago, when the Revolutionists had control of the Kutais district of the Caucasus, he conducted a punitive expedition of Cossacks thru the mountains and laid waste the Rion Valley with such atrocities as to arouse indignation even in Russia. The commission which was appointed to investigate his conduct condemned him for cruelty, but he was not punished. For the destruction of fifty villages and the slaughter of hundreds of inhabitants of the valley, he received the nickname of "The Pacifier." ——An attempt to introduce tugboats as a motive power on the Ladoga Canals aroused the peasants of the neighborhood to violent opposition, because it took away their occupation of towing the barges. The canal was barricaded and the tugboats stoned. The rioters were dispersed with some loss of life by troops, but a sympathetic strike of the entire forces of laborers employed along the canal put a stop to traffic. Efforts to break the strike have so far been futile. Another strike which seems to have a semi-political motive is that of the textile workers in the vicinity of Moscow, 60,000 of whom are now out. Peasant riots are reported in many of the provinces, and the police are unearthing numerous revolutionary clubs and bomb factories.

Absolutism in Portugal

King Carlos seems to be experiencing no serious difficulty in governing without a parliament. There were at first some riots, especially by students, and some talk of pretenders, but these symptoms of popular disapproval have disappeared. The King continues to court the army by visits to the barracks and to legislate by edicts. The only disorder reported of late is the stoning of the automobile of Queen Maria and Prince Manuel by hoodlums, who fled when the car stopped. The Crown Prince has gone on a two months' tour of the Portuguese colonies in Africa. The newspaper *O Mundo,* which tried to prove by expert alienists that Premier Franco was insane, has been found guilty of abusing the liberty of the press, and three members of the staff have been fined from $50 to $250. A royal edict has "legalized" the advance of $2,000,000 made out of the public treasury without authority of law for the expenses of the royal family. Judge Mattos Abreu, of the Tribunal of Commerce at Cintra, who declined to recognize the validity of the recent non-parliamentary legislation, will be proceeded against by the Government. Premier Franco now proposes to abolish the

House of Peers and substitute an elected Senate in order to secure a more tractable Upper House. He makes no promises as to when constitutional government will be restored, and if he waits until the time implied in the following quotation the present régime will not be short:

"I intend to maintain the present régime of dictatorship until the different political factions responsible for the deadlock in the late Parliament agree to work together conscientiously for the country's good. I will then consider the question of the reopening of Parliament. In the meantime, the present policy will be strictly enforced against all the Opposition parties. His Majesty's great aim is to restore the economic condition of Portugal on a prosperous basis, to develop her commerce, and revise taxation and the customs duty. All these reforms have, of course, been opposed by rival leaders of the Opposition, but for merely personal ends."

Women in German Universities

The propaganda for the admission of women to the German universities is phenomenally rapid and successful, and now a formal crusade has been inaugurated to capture the last and greatest citadel of the enemy, namely, the ten universities of the Kingdom of Prussia. These have been hermetically sealed to women, altho during the past few years all of the universities of Southern and Central Germany have opened their doors to women on exactly the same conditions as that which prevails in the case of men, namely, the three Bavarian institutions at Munich, Erlangen and Würzburg; the two of Baden at Freiburg and Heidelberg, Tübingen in Würtemberg, Jena in Thuringia, and Leipzig in Saxony. Now a formal petition has been presented to the Cultas Minister of Prussia, signed not only by a host of educators thruout the kingdom, but also by one hundred and sixty university professors of Prussia, asking the State to admit women to its matriculation and examinations. If the Prussian Government yields, as is confidently expected, because the State has only recently taken up the thoro revision of the secondary girls' school scheme changing these into a lyceum institution leading up to university, then Mecklenburg, with its institution at Rostock, will follow, and each and every university in the Fatherland will have yielded to a propaganda that has been prosecuted systematically less than a quarter of a century. The number of women who actually matriculate at these universities is steadily growing, the number last semester out of a total enrolment of perhaps twelve hundred women in all the twenty universities having been 302, an increase of nearly fifty in one term and nearly one hundred in a single year. Besides this there were in Prussian universities perhaps two hundred who possessed the *testimonium maturitatis*. Berlin alone had 128; so that fully one-third of the women contingent at these German institutions are fully prepared to do the work. Of the 302 registered as graduates for promotion, 134 are students of medicine, 113 of philosophy, language and history, 31 of natural sciences and mathematics, 15 of law and 3 of theology. Statistics show that the number of women who become academic citizens for other than ornamental purposes and are really determined to enter upon professional careers is steadily increasing.

The Abdication of the Emperor of Korea

An important step in the gradual absorption of Korea by Japan was taken this week when the Emperor, Yi-Heui, resigned his throne to the Crown Prince. The ostensible cause of his removal was the dissatisfaction of the Japanese Government with the Emperor for secretly sending a delegation of prominent Koreans to The Hague, claiming a seat in the Conference as an independent nation, and appealing to the Powers for protection against Japan. No attention was paid to the delegation by the Conference, and when the Rèsident-General, the Marquis Ito, charged the Emperor with duplicity, he repudiated the delegation and denied having authorized it. This brought matters to a crisis, and the Japanese Foreign Minister, Viscount Hayashi, came in person from Tokyo to Seoul to assist or overrule Marquis Ito. He was greeted enthusiastically on his arrival at the Korean capital July 18th by 15,000 Japanese, who expected that the practical annexation of the country to Japan would be the outcome of the movement. The same night the Korean Cabinet under Premier

Yi Wang Yong appeared before the Emperor at the palace and insisted upon his abdication. The Emperor was angry, humiliated, frightened and helpless. He called for the Resident-General, but he refused to come. At the palace gates was a mob of several thousand Koreans, but they were held in check by the Japanese police force. The Korean troops were ready to defend their ruler, but the Japanese machine guns were trained against their barracks, and the Government arsenals were guarded by soldiers

YI-HEUI,
Last Emperor of Korea, who has just abdicated.

under orders to blow them up if they were unable to defend them against the mutinous Koreans. The Emperor asked that the Elder Statesmen might come to him to advise him at this critical moment. The four veteran Koreans immediately appeared before His Majesty at one o'clock Friday morning, and, much to the Emperor's disappointment and chagrin, agreed with the Cabinet that his resignation was imperative. He then signed the following rescript:

I have been, in succession to my ancestors, on the throne for forty-four years, and have met many disturbances. I have not reached my own desire. While Ministers are frequently improper men, and progress is not controlled by men, the times are contrary to natural events. A crisis extremely urgent in the life of the people has arisen, and the progress of the State is more than before imperiled.

I fear a danger like that which befalls a person crossing the ice. Fortunately we have a son endowed by nature with virtue, brilliant, and well worthy of being charged with plans for the development of the Government, to whom we transfer our inheritance, sanctioned by the customs of ancient times.

Therefore be it known that, as soon as it is proper to be done, we will hand the affairs of State over to the Crown Prince as our representative.

Early in the morning the Crown Prince assumed the imperial seal with due ceremony, and in the afternoon received the congratulations of Marquis Ito, eighty Japanese and native officials and many Consuls General. The new Emperor, Yi-Syek, who was born in 1874, is the son of Queen Min, who was murdered and burned on a pile of floor mats in the court of the Palace by a Japanese mob in 1895. He is said to be weak in intellect and character, but has received some foreign education in Japan and from American tutors. The late Emperor was born in 1850 and became King of Korea in 1864, assuming the title of Emperor in 1897. He has been a mere political puppet under the control of the women of his Palace, intriguing alternately or simultaneously with Japan, China and Russia. After the retirement of the Japanese from the peninsula ten years ago, Americans were favored as the least dangerous of foreigners. Mining and transportation concessions were given to them, and the country became a promising mission field. Since the return of the Japanese the aspect of affairs has changed. The announcement of the abdication of the Emperor was the signal for rioting in Seoul and other Korean cities, but it is believed that General Baron Hasegawa, the Commander in Chief of the Japanese garrison, has control of the situation. An attempt was made, apparently at the instigation of the ex-Emperor, to assassinate the Ministers, and their homes were sacked and burned by a mob. The Ministers sought refuge in the Japanese Residency-General.

The Outlook at The Hague

BY HAMILTON HOLT

[Mr. Holt, our Managing Editor, is now at The Hague attending the Second Peace Conference for THE INDEPENDENT. It is encouraging to learn of the good spirit that pervades the Conference and of the substantial results that are confidently expected as to the ultimate outcome.—EDITOR.]

IN the heart of the spotless town of The Hague is an ancient tower with a gateway known as the Gevangenpoort, which was used during the period in which Spain exercised control over the Netherlands as a prison for political offenders. Today the awe-struck visitor is shown the horrid collection of instruments of torture that were used to make the poor victims confess their alleged crimes. A stone's throw from this gruesome antiquity stands the ancient Hall of the Knights, a brick building, with gables and two turrets, of the time of Floris V, somewhat resembling a chapel. In this hall are now in session over two hundred delegates from forty-seven sovereign nations of the world, who, for the first time in the annals of history, have been convened to discuss affairs common to all. The majority of the delegates to the Second Hague Conference are now avowed representatives of those political ideas, which a few centuries ago caused men and women to be put on the rack, beaten, drawn and quartered in the Gevangenpoort across the way. The reason why the Hall of the Knights is used for this Conference instead of "The House in the Woods" is

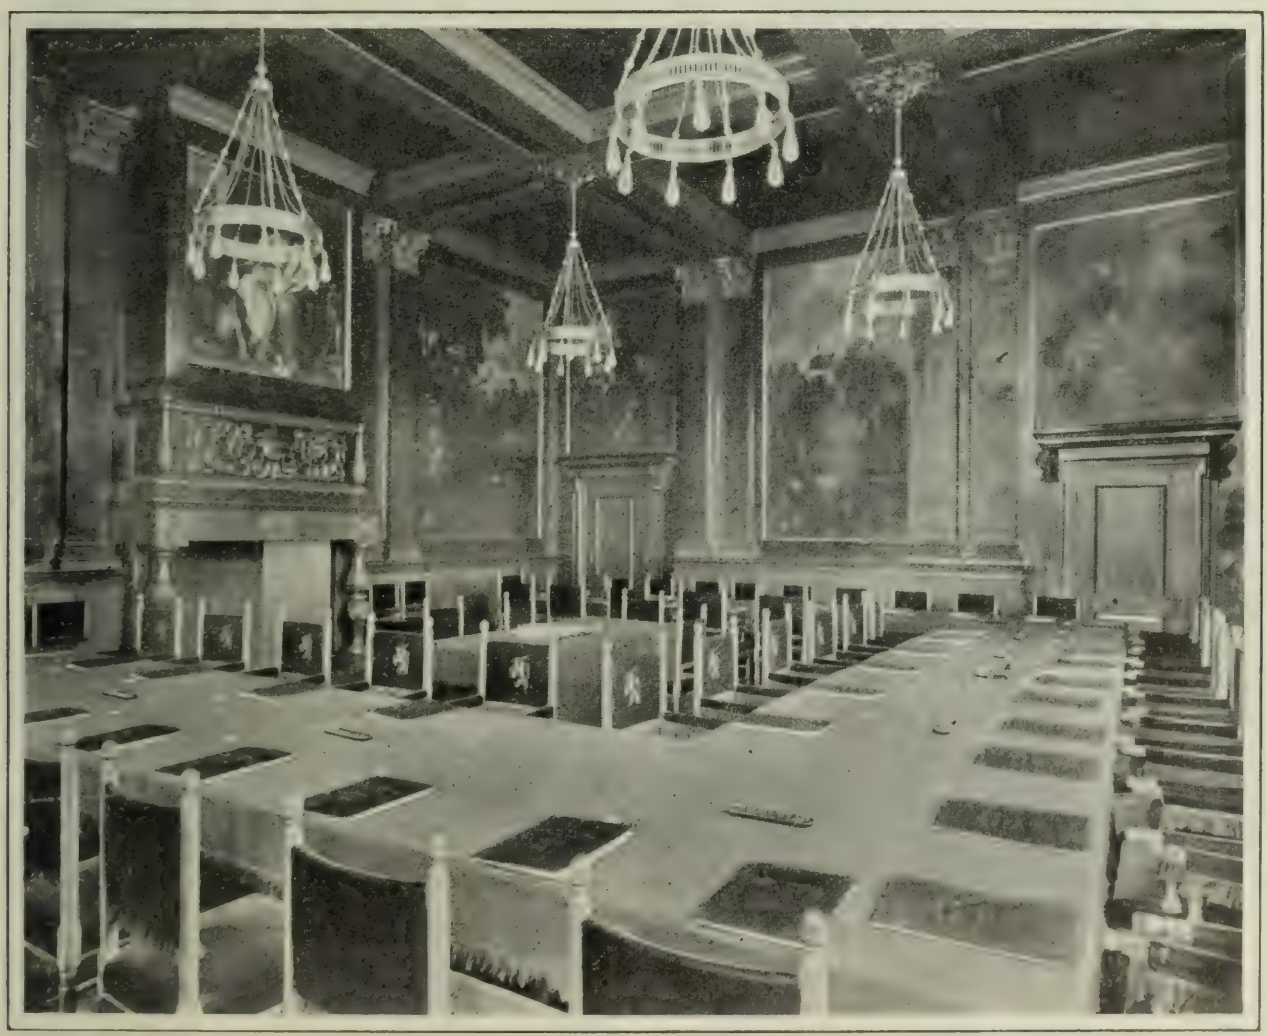
THE OPENING OF THE SECOND PEACE CONFERENCE.
The Arrival of the Delegates at the Hall of the Knights.

that the latter is too small for the present Conference, containing representatives as it does from forty-seven nations. "The House of the Woods" could accommodate no more than the twenty-six nations who composed the first Conference.

When the Czar issued his manifesto summoning the First Hague Conference in 1898, it was received with ridicule, or, at best, polite incredulity on the part of the world, and when it assembled in 1899 it was amid the skepticism of its own members. As it convened very soon after its call the Governments had no time to formulate their plans, or to know clearly what they wanted. Everything was new, suspicion was rife, there were no precedents for procedure, and even those who came with the best intentions had little conception of what they might reasonably hope to accomplish.

No one can have talked with the delegates to the present Conference without realizing that the long period of doubt which characterized the early half of the first Conference has no place at this one. Members of the various delegations, especially those who were also members of the first Conference, are continually commenting on the fact that this Conference is composed of men who came confident that much could be accomplished and determined to accomplish it. In short, I have failed yet to find at The Hague a single person, official or unofficial, who has any doubt that positive results will be attained at this Conference.

INTERIOR OF THE HALL OF THE KNIGHTS, WHERE THE HAGUE CONFERENCE MEETS.
The American Delegation have the seats outlined in white at the left.



In the opening address of welcome by Von Tets, the Dutch Minister for Foreign Affairs, the hope was expressed that this would not be the last of the Peace Conferences to be held at The Hague, and in his inaugural address Nelidoff, of Russia, the president of the Conference, while expressing the opinion

that we shall never arrive at universal peace and justice, declared that these ideals ought to inspire the effort and action of the nations. This limitation upon the possible achievements of the Conference was received with displeasure here in the Conference as well as generally thruout the world.

Immediately after the opening session, when the Russian first delegate was elected president, the work of organization was undertaken, and in less than a week four sub-commissions had been constituted, and their members and officers appointed. These commissions are, first, the Commission of Arbitration, unquestionably the most important of all and over which Bourgeois, of France, presides. It is divided into two sub-commissions, the first dealing with the subject of arbitration, taking for its basis the Hague Convention of 1899, and the second dealing with the question of a prize court and those other propositions not included within arbitration proper. The second commission, of which Beermaert, of Belgium, is president, deals with warfare on land, and is considered the least important.

The third and the fourth commissions, which are of about equal rank, standing midway in importance between the first and second commissions, deal respectively with warfare at sea and maritime law. Tornelli, of Italy, is president of the former, and Martens, of Russia, of the latter.

The presidents of these various commissions immediately called for propositions in writing, and within the first fifteen days a number of important proposals have been submitted, altho it is believed that several of the nations, especially the United States, are holding back some of their most important ideas.

THE FIRST COMMISSION'S MEETING ROOMS, HALL OF THE KNIGHTS.

The chief propositions so far submitted are as follows:

By Russia: An annual conference of

the members of the Hague Court for the purpose (a) of choosing three of their number to constitute during the following year a permanent tribunal ready to try cases at fifteen days' notice, (b) of performing certain duties in connection with the administration of the international bureau at The Hague, (c) of expressing their opinion upon questions of present importance in the international affairs, and (d) of conferring together on the progress of international arbitration in general.

By Germany: The constitution of an international prize court to try questions arising out of a state of war.

By Great Britain: A similar proposition as that made by Germany and also the abolition of contraband of war.

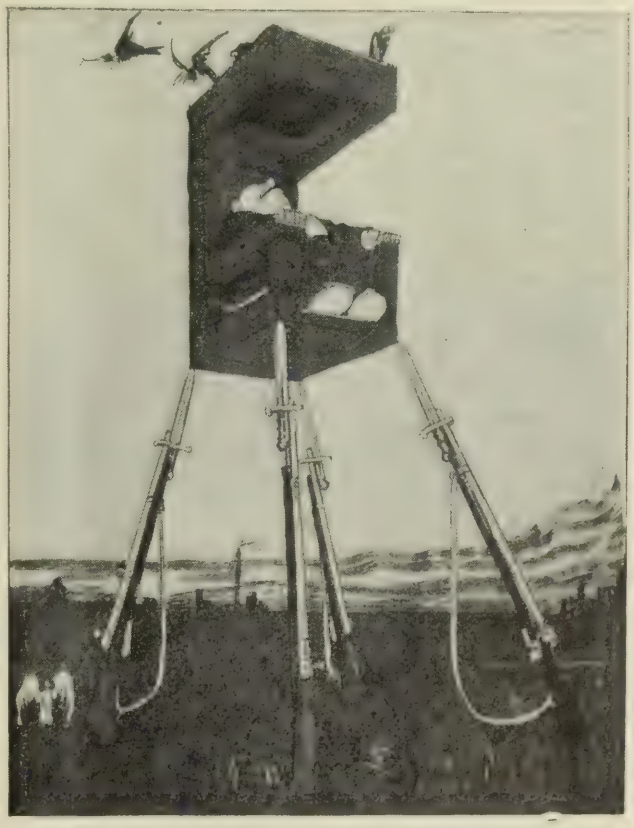
By the United States: (a) The immunity of private property at sea, and (b) no recourse to force for the collection of debts until after the claim has been submitted to the Hague Court.

By France: Provision for simplifying the procedure of Commissions of Inquiry and for increasing their utility.

By various other nations: Propositions looking toward the regulation of submarine mines, the protection of unprotected places from bombardment, the abolition of ransoms, etc.

The Russian proposition for strengthening the Hague Court by making it a more permanent organization is probably the most important proposition, but it is unlikely to serve for more than a basis of discussion. As Secretary Root, in his striking speech before the New York Peace and Arbitration Congress, took the ground that judges should be substituted for diplomatists in the composition of this Court, it is perhaps safe to assume that the United States delegation will

OFFICE OF M. NELIDOFF, THE PRESIDENT OF THE CONFERENCE, IN THE HALL OF THE KNIGHTS.



offer modifications to Russia's proposition, or more likely an entirely new one of their own as a substitute. It has not yet been intimated how the United States will attempt to carry out Secretary Root's ideas in detail. But every one expects that a proposition for strengthening the Hague Court will in some form be adopted.

The propositions of Germany and England for an international prize court have been referred to a sub-committee and it is expected that the plan will go thru with little opposition.

Of the two propositions submitted by the United States the one relating to the collection of debts by force is the most important and is under the direct supervision of General Porter. The best informed sentiment predicts that this proposition will be adopted. In such a happy event the chief danger of conflict between the Old and the New World will be averted. Now the strongest probability of our country's being involved in a war with a European Power is the failure of a South American country to meet what are considered by European Powers their just demands. By the adoption of this proposition, European Powers would be compelled to prove the justice of their claims before an impartial Court before proceeding to collect them by force. Everybody will be in favor of the payment of claims proven to be just, and no nation can object to the use of force to collect a judgment, when a debtor nation fails to pay within a reasonable time. It is evident, therefore, that the adoption of this proposition will solve the problem of the relation between the Old and the New World.

America's second proposition in regard to the inviolability of private property at sea is in charge of Mr. Choate, the president of the American delegation. It has already been informally opposed by Russia and England, and its fate is somewhat in doubt.

It is probable that what is best in all these propositions, and in others soon to be propounded, will be adopted in due time by the Conference. Then the paramount question of future Conferences will be taken up. The readers of THE INDEPENDENT have been told again and again that, in the periodic and automatic assembling of future Conferences lies the germ of the Parliament of the world, just as in the present Hague Court lies the germ of the Supreme Court of the world. I am therefore most gratified to find a widespread and prevailing sentiment here that this Congress ought not to adjourn without provision being made for its automatic and periodic reassembling. To be sure, the motives that have strengthened this sentiment, in some cases, may be connected with the desire to take the future Conferences out of the hands of Russia, who seems to many duly anxious to predominate at this Conference, which owes its existence to the initiative of the chief executive of another country, and which was convened by the Czar of Russia only by the courtesy of President Roosevelt. Still there is little to be gained by questioning motives when the ends to be attained are good.

WHY DISARMAMENT IS IMPOSSIBLE.
To abolish armies would be to demolish the base of the capitalistic throne.—*From L'Assiette au Beurre.*

If, then, the outlook is very encouraging for taking the future Conferences out of the hands of Czars, Presidents or parliaments, I find, on the other hand, that

no action is likely to be taken on the question of disarmament. There is absolute agreement on this point. Indeed, it is doubtful if even the question of limitation of future armaments will be discussed, and that, too, despite the fact that England and the United States have suggested it as part of the program. As THE INDEPENDENT has held from the first, the disarmament must be preceded by an increased sense of national security, thru the development and application of legal principles in the settlement of international disputes. It seems certain, moreover, that the failure to accomplish anything at this time toward the limitation of armaments is not an unmixed evil. Indeed, it is likely to strengthen the hands of those delegates who are working to give permanency to the international Conferences, and more authority of the Hague Court. It is becoming plain to many that the way which leads to relief from the oppressive military burdens which now weigh so heavily upon Europe is to be blazed out by the pioneers at these Peace Conferences, and can be made practicable only when the system of law as a substitute for war is well developed and successfully operated.

In regard to the role that America is playing in this Conference, in comparison with her achievements at the first Conference, it is, of course, a little too early to speak. It is notable, however, that no American is at the head of either of the four commissions, or even of the various sub-commissions into which these are divided. Our delegation is also handicapped by being less familiar with the French language than most of the other nations. Still our representatives are determined to make themselves felt at this Conference; in such a way as will reflect credit upon the United States as the initiator of this particular Conference, and as an acknowledged leader in the advocacy, not only of that movement which would substitute law for war, and principle for policy, but in every other department of activity. The American delegation and all other delegations are working hard and conscientiously and the world can reasonably expect that their labors will be crowned with success.

THE HAGUE, HOLLAND.

The Prevention of Battleship Disasters

BY PARK BENJAMIN

THE premature ignition of a cartridge bag of powder in one of the turrets of the battleship "Georgia" during target practice, followed by the usual killing and wounding of the gun's crews therein, is the fourth casualty of the kind which has happened in the Atlantic fleet within the last three years. In the case of the "Missouri" the disaster was ascribed to the "flareback" of burning gases remaining in the gun after a preceding shot, which, on the opening of the breech to insert the new charge, blew backward and set fire not only to the cartridges in the turret, but to those in process of elevation on the ammunition hoist. In the case of the "Massachusetts" it is supposed that some entanglement of the lockstring which controlled the mechanism of a percussion primer resulted in the destruction of the latter before the breechblock was entirely closed, so that the whole charge exploded rearward into the turret. In the case of the "Kearsarge" a metal tongs in the hands of one of the gun's crew accidentally touched certain electrical connections, establishing a current which fused the metal of which the connections were made, so that it fell in red-hot drops on the cartridge beneath. In the present instance of the "Georgia" it seems that the charring of the cartridge bag by a spark somehow lodged therein was actually noticed by some of the

wounded men, so that they threw themselves flat on the floor of the turret in the effort to avoid the recognized inevitable result. How the spark got there is a matter for a board of inquiry to determine.

As the people in the navy have no desire to be killed by their own weapons, and in fact are much more interested than any one else in ensuring the maximum possible degree of safety in handling them, it may be assumed that they will not rest until a satisfactory accounting for this latest accident is reached and a means of prevention in the future provided. In each of the three earlier cases they acted promptly and efficiently. Devices for driving out the residual burning gases from the gun bores after each discharge, and for shielding from sparks cartridges in transit from the magazines have been installed, drill methods have been established which minimize such accidents as that of the "Massachusetts," and electrical appliances have been altered so as to be safe from chance short-circuiting.

Nevertheless, the public is beginning to believe that in these matters, as in all others, the "ounce of prevention is better than the pound of cure"; and that when four fatal disasters happen, every one of them involving the untimely ignition of a bag of powder in the same place—a battleship's turret—it is about time to get at the bottom of the trouble. For the risk is not merely that of the lives of the men who may happen to be in the turret during some practice drill, but if this sort of thing is to continue we are confronting a question of grave national peril—of whether in these tremendous machines, as we handle them, lurks an element of self-destruction which we have not under control, and which may assert itself at the most critical juncture to our confusion and defeat. That is the disquieting note which such casualties as the present make insistent.

The most advanced type of war vessel today is that which carries a few guns of the largest caliber segregated in pairs in heavily armored turrets. The new "South Carolina," hardly more than begun, has eight 12-inch guns mounted in four turrets. The new 20,000-ton "Dreadnoughts" lately authorized by Congress and not yet started will have ten 12-inch guns in five turrets. One object of dividing the fighting force in this way is to prevent the panic which sometimes demoralizes a body of men if shut up in a single cell, such as a ship or fort, when a comparatively small fraction of their number is destroyed. But of what avail is impregnable armor and divided force if there be a more dangerous enemy inside the separate cells than outside of them? If in the course of ordinary target practice we cannot protect our turret crews against their own powder, certainly it would seem that in the fierce excitement of actual fight the danger is likely to be greater. And what is to be thought of the security afforded the country by its battleships if the most formidable of them is liable, thru explosions of this kind, to find her fighting efficiency instantly cut down 20 or 25 per cent.? What, it may be asked, is the precise utility of wrangling over big ships or small ones, turret emplacements, armor distribution, gun calibers, and the multiplicity of other vexed questions now to the fore if we cannot get a bag of powder from a battleship magazine to a gun in a battleship turret without imminent risk of something blowing it up?

We are the most inventive nation on the face of the earth. Nine-tenths of the industries of the country are based on patented inventions, forty thousand patents are granted yearly, and their aggregate number is fast approaching a million. The inventors can solve this problem if the Navy Department will give them the proper opportunities and encouragement. This would seem so obvious a course, as to admit of no argument as to its expediency—but to assume this is to forget that the Navy Department's policy has for years been exactly the opposite, and the mass of rooted conservatism to be dislodged is even yet formidable. The tendency has been not to look for the good in a novel conception, still less to experiment with it in order to find out how far it may have advanced toward the solution of a given problem, but to submit it to tests calculated to prove it a failure and even to show that it will not do what the inventor never intended it should do. The narrowness, the stubborn conservatism,

the blockhead stupidity of some of these past "investigations" at times almost passes belief.

Take as a shining instance the history of the telescope sight. We are greatly felicitating ourselves upon the fine shooting of the fleet—yet it is the telescope sight which makes that possible. Without it the modern high-powered gun is of little avail. Every nation employs it—has to use it—as the Russians found out to their cost in the late war. It is the invention of Commander Bradley A. Fiske, of the Navy. Its efficiency and value were conclusively shown by him under conditions of practical use in 1892. The Navy Department gazed at it doubtfully and half-heartedly "tried it on a dog." The captain of the dog—little wooden cruiser—dismounted it, put it in the hold and forgot it. Ten years later Fiske rigged it himself on the "San Francisco" whereon he was serving and got 94 per cent. shooting efficiency from unpractised men and 81 per cent. from coal-passers and machinists who had never aimed a gun. He sent the verified target records to the Department and it sneered at them—poked them in pigeonholes—argued learnedly that the telescope would black the user's eye when the gun went off. Meanwhile some civilians who were much wiser than their servants in Washington started to develop it privately. After they had done this at large cost, wholly defrayed from their own pockets, they again called the Department's attention to what the thing would do. The Department asked for all the information, got it and then appropriated the invention—pirated it, to be plain, deliberately and surreptitiously—to the extent of four hundred instruments. That was encouraging to the country but hardly so to the people who had paid the bills. Litigation followed directed against a private co-infringer—who could not get behind his sovereignty. Then the Department threw mud—flouted the decisions of just as respectable a branch of the United States Government as itself, tried to deprive the inventor—one of its own officers—of all credit by asserting that he had copied the device from a lot of old British gimcracks which no one better than itself knew to be utterly useless failures—and this while positive official evidence to the contrary was under its very nose. Finally it capitulated—paid (after most phenomenal exhibition of red tape) for its past misdeeds—and then the Navy began to shoot straight. "They called the invention impracticable and the inventor a 'crank' "—wrote Commander Fiske the other day thus sententiously summing up this part of his always interesting autobiography.

Another instance—the Haeseler breech mechanism—Haeseler, a lieutenant in the Navy, now deceased, was an inventor of the first rank and is ever memorable as the man who doubled the speed of fire of the "Texas's" guns during the Spanish War. He got up a beautifully ingenious device for closing the breech of large guns as a substitute for the heavy swinging plug with its mutilated screw-thread now used. The present writer saw it successfully tested on an 8-inch gun six years ago. It was rejected because it was nobody's business to see that even if it had little defects, experiment could easily remedy them. Says a high officer of the Navy today with extra vitriolic sarcasm, born of the knowledge that he has been steadily pouring it out on the Navy Department's wiseacres for years, without much avail:

> "It was supposed that the pitch of the thread might be too great or that the latch holding against a possible rotating action of the charge might be too weak, and so we were rid of the device for a long time—up to the present, only one navy has regularly applied it in service and it will be at least five years before all navies adopt it so that it will come to us in the regular and natural way and in the proper stage of development—the obsolescent in contradistinction to the experimental."

The navy he refers to is that of Japan—and when the great Japanese cruiser "Tsukuba" came into New York Harbor the other day, in her guns were the Haeseler breech-blocks which his own country had rejected—and which, later on, it will probably copy.

The Navy Department having deemed it wise in the past to treat naval officers in this way, and Congress having still further encouraged them by occasionally proposing unconstitutional laws for confiscating their brain work, it is hardly necessary to dwell on the scant consideration it has given to civilian inventors.

Equally no argument is required to show that if this policy is to be continued in the future, powder bags will very likely continue to blow up, the efficiency of the fleet will grow more and more in question and enlistments may confidently be expected to decrease—for no one, however patriotic, joins the colors with any idea of being immolated on the altar of official neglect or stupidity.

The country therefore now looks with especial interest to the Navy Department to see what it proposes to do next. It has all necessary powers, and what perhaps is even more persuasive to the official mind, a clear precedent; for Secretary Whitney, during his admirable term of service, did—to the dismay of the ultra-conservatives of the day—appoint a board of officers to investigate all inventions and new ideas submitted, and to report such as seemed worthy of further experimentation. The times were against that board and it did not live long.

Lately, however, criticisms of the shortcomings of the Navy have rapidly multiplied; and ample ground for them has been furnished by the astonishing revelations made last winter to Congress by the bureau chiefs showing the grave deficiencies existing in reserves of guns, ammunition and men. These conditions are for Congress to meet and for them it alone is responsible. It is as idle to blame the present executive officers of the Navy Department for them as to attack the present Department for the well known errors made years ago in the designs of the battleships of the "Oregon" and "Kearsarge" classes—a task recently undertaken by some ill-informed newspapers. But it is within the power of the existing authorities to lay the foundation for systematic experimental work upon new ideas—and to end finally the hitherto ultra-conservative policy which really underlies so many of the mistakes and disasters of the past.

Secretary Metcalf has already taken a step in the right direction in his recent invitation to all officers to submit suggestions which in their judgment would tend to promote the efficiency of the naval service, coupled with the promise of record credit to those whose proposals lead to useful advances. This is good so far as it goes, but it should not be limited to naval officers only. It should be extended to inventors generally and should include some assurance not only that their conceptions will not be confiscated and they left to the dubious help of the court of claims to secure compensation, but that they will actually be helped wherever their ideas warrant the all-powerful aid of the Government in the direction of further development.

The most practical suggestion thus far made has come from Commander Fiske himself, who possesses not only great experience as an inventor, but is one of the most progressive men in the Navy. He proposes that "a sea-going ship having a turret" be set apart for trying out and developing all novel notions of seeming value—and the disposition of such unsettled questions as those pertaining to powder, safety devices, gun-sights, mounts, ammunition hoists, loading contrivances and the like. It is very difficult to get these things experimented upon on vessels in active service with the fleet, since these ships have plenty to do in the way of drills and maneuvers to keep them keyed up to the proper state of constant preparedness. A special ship, however, say one of the type now obsolescent like the "Massachusetts," at present in ordinary at the New York Navy Yard, would be excellently suited for this purpose—and besides it would not at all incapacitate her for such war service—say coastwise defense—as she is still able to perform. Commander Fiske, altho one of the senior officers of his grade, is at present, for some reason not quite clear, left in charge of an obsolete monitor used as a practice ship for the youngsters from Annapolis. His proper place is in command of the experimental battleship. Nobody could organize such an institution as well as he could. That would be the beginning of the end of the sort of disaster we are now called upon to deplore as well as the best assurance now available that the destructive power of our battleships will be directed solely against the national enemy and not against their own crews.

New York City.

Fair was Rebecca of whose charm
  Old Jewish legends tell;
Fairer our neighbor of the farm,
  The maiden at the well.

The water ripples as of old,
  Thru centuries' ebb and swell;
Another avatar behold
  Of beauty at the well.

PRESENT CITY HALL OF HOUSTON.

This was built by the Commission at a cost of $100,000. It is much superior to the old building destroyed by fire two years ago, costing $350,000 in Reconstruction days, on which the city is still paying interest.

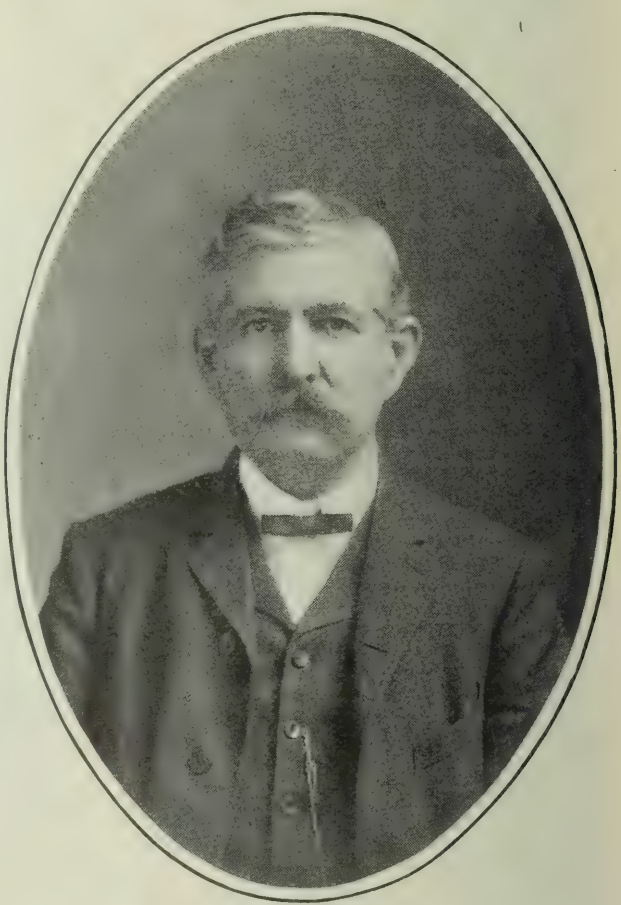
Government by Commission in Texas

BY W. B. SLOSSON

THE "Commission Idea," which is spreading so rapidly among the cities of the Southwest, is one of the inventions born of necessity. It originated with the great Galveston flood. On September 8th, 1900, the island on which the city of Galveston stands was, for the first time in its history, swept by a tidal wave urged on by a West Indian hurricane, and in a single night 6,800 of its people perished and $19,000,000 worth of its property was destroyed. The demoralization of the city and its government was complete. Its credit was impaired; its future was dubious, and its political machinery was inadequate to meet the burdens and difficulties of the situation. In this emergency the "Commission Idea" arose. The Governor of the State appointed a Mayor and two Commissioners; two others were elected by the people. Afterward by act of the State Legislature all five officers were elected by the people.

This Commission was as follows: Judge William T. Austin, Mayor (since deceased); I. H. Kemptner, Commissioner of Finance; H. C. Lang, Commissioner of Waterworks and Sewerage; A. P. Norman, Commissioner of Police, Fire and Streets; V. E. Austin, Commissioner of Electric Lights and Public Property.

For more than six years now this new

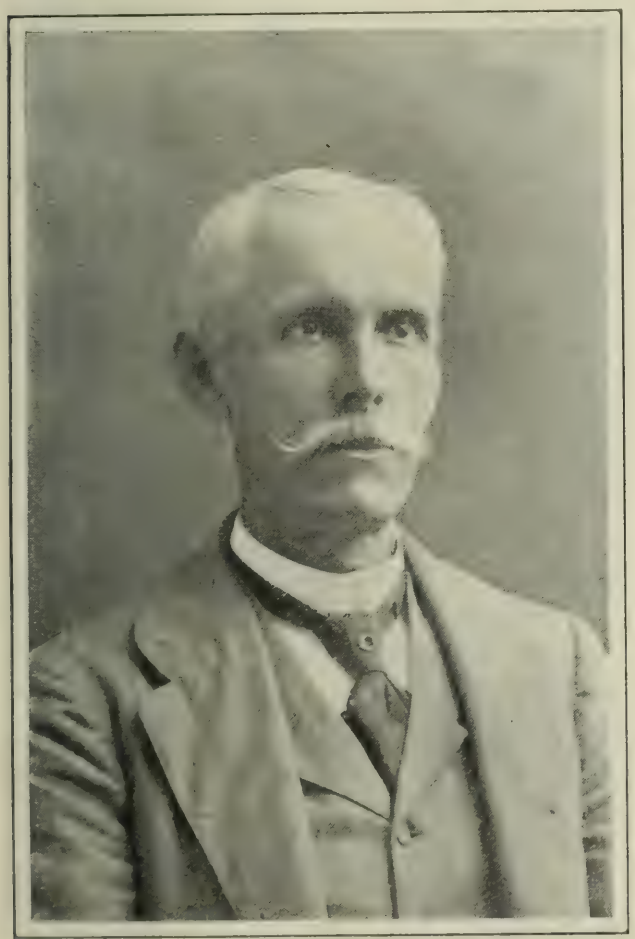


COL. H. BALDWIN RICE,
Mayor of Houston.

experiment in municipal government tried by Galveston has been closely watched by the people of the State, and other cities were earnestly inquiring of its success or failure.

The Galveston Commission has accomplished a notable work in paying off the large debt of the city contracted before the storm; keeping up the interest on all bonded indebtedness, thus restoring the credit of the city, and making great permanent improvements such as raising the grade of the city and building a sea wall that would preclude the possibility of damage by storm again. All this and much more was done by the Commission without increasing the rate of taxation, which, instead, has been steadily decreased. Besides this the people of the State observed that no graft or even extravagance had been heard of in the six years in which it had been governed by the Commission.

The citizens of Houston, the largest city and railroad center of the State, seriously discussed this important change in city government, and adopted it after a spirited campaign in which the Councilmen, and the politicians backing them, fought hard against the movement legislating them out of office. On July 5th, 1905, Colonel H. Baldwin Rice, administrator of the late Wm. M. Rice, of New York, was elected Mayor, and James Appleby made Chairman of Fire and Police;



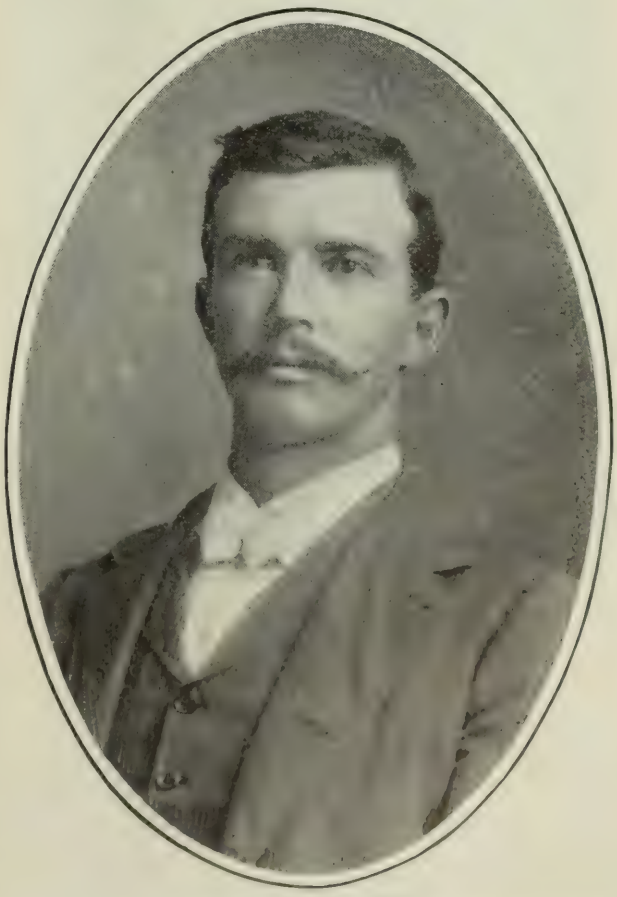
J. Z. GASTON,
Commissioner of Finance, Houston.

J. Z. Gaston, Chairman of Finance; James A. Thompson, Chairman of Water, Health and Light, and J. B. Marmion, Chairman of Streets, Bridges and Parks. All five are business men of Houston, elected as the Commission to control the city for the term of two years.

The test of the Commission plan for the last two years has been eminently satisfactory. By the charter the Mayor is given full power in the appointment and also the removal of all employees. He has control of the city and is held responsible for its government. No tenure of office is sure to any employee if he does not do his full duty to the city. The Mayor and Commissioners are elected by the people to do their business for them, as a bank or corporation is managed by its directors. They are

paid living salaries monthly and are expected to give their whole time to the work of the city.

Each Commissioner has charge of a distinct part of the government, for which he is individually responsible. The Mayor and Commissioners hold daily sessions, where the policy and all official acts are discussed as presented by the separate departments. As a rule the measure proposed by the chairman is endorsed unless a majority decide that the measure is not practicable. One public meeting is held each week at which citizens may present petitions, and public business is discussed in open session. Under the old system the city was divided into six wards and two Councilmen were elected



JAMES A THOMPSON,
Commissioner of Water, Health and Light, Houston.

from each ward, and they were expected to represent this ward in the Council. They were paid a mere pittance for attending the meetings, and if they owed any allegiance it was to the ward and not to the city as a whole. The two Councilmen for each ward were expected by their neighbors to secure from the Council one-sixth of the public improvements, and in case of a bond issue to bring one-sixth of the money to be spent in that ward regardless of the needs of the city as a whole or any part requiring larger improvements.

Houston had not suffered in the way of graft or corruption more than other rapidly-growing cities of its size, but the government was insufficient and unsystematic. In fact no system is possible where twelve men, meeting a few hours once a week, decide upon appointments, petitions, granting of franchises, raising or lowering the salaries of hundreds of employees or officers, authorizing improvements, levying taxes, etc.

The Commissioners are elected to have no local interest, but are constantly in the limelight of public opinion, and to them all the people turn, expecting a "square deal" from public officers who are the servants and hired employees of the people. Under the old régime "everybody's business was nobody's," and in Houston thousands of dollars worth of personal and real estate had entirely escaped taxation or assessment. The first year the Commission has found this a rich field

J. B. MARMION,
Commissioner of Streets, Bridges and Parks, Houston.

from which to derive a just revenue and, as equality of taxation appeals to all as proper and right when it can be no longer dodged, the commission has made itself popular even in this action.

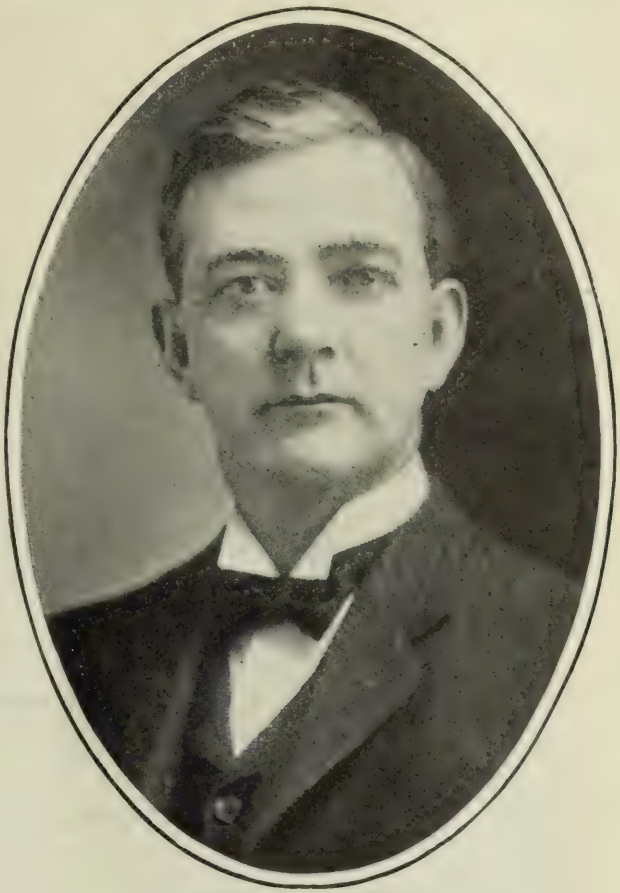
The county officers have caught the infection, and many a wealthy landowner has discovered that more of his property is now found on the "rendered roll." Heretofore the city's business and salaries were paid by loans from banks or the issuance of city warrants that speculators bought at a discount. During the first year a floating debt of $385,000 was paid, and now all bills are settled on the tenth of each month. The city is on a cash basis and warrants are unknown.

The city has recently bought the plant

JAMES APPLEBY.
Chairman of Fire and Police, Houston.

that furnishes the city with artesian water at a cost of over $900,000, paying nearly half that amount out of the current revenues and the balance in bonds at a low rate of interest. In the sale of these water bonds is shown the financial standing of Houston. The sale was made on the 11th of August, 1906, with eleven bidders present from the financial centers, and they went to a Cincinnati firm at a premium above par of $25,300 in cash, and this after only thirteen months of government by commission since the time when the city warrants were hawked around the streets at a discount of 10 per cent. below par.

A bond issue of $350,000 had been made by a former Council for placing the sewage outside the city limits, because the United States Government is making, at a cost of $4,000,000, a 25-foot deep channel 150 feet wide up Buffalo Bayou from Galveston to Houston (fifty miles), and the Government engineers required that the city sewage be first removed from Buffalo Bayou. This $350,000 was practically wasted by the old city government and Houston had for the three years been paying interest on bonds that yielded no benefit. The Commission in the first year complied with the demands of the National Government, and an effective sewer system was put in, so that today the sewage of Houston is cremated three miles outside the city limits according to up-to-date sanitary plans of larger cities. It should be understood that under the homestead exemption laws of Texas paving and sidewalks are not paid for by owners of abutting property, so Houston paves all her streets and builds all her sidewalks from the general revenue fund.



In this first eighteen months the Commission brought the city to a cash basis, paid off a floating debt of $375,000, spent over $150,000 for new school buildings, paved with vitrified brick three important streets, Main, Milam and Liberty; paid all officers and employees in cash, paid all interest on bonds and reorganized the police and fire departments so that all departments of the city are now working harmoniously. What surprises the interested inquirer is that after the large expenditures made by the Commission they were yet able to reduce the tax levy for this year by 10 cents on the $100 valuation.

It is hardly a wonder that in view of the actual results accomplished in so short a time that other Texas cities are following the wake of Houston and Galveston. Dallas, Ft. Worth and Waco have ar-

ranged to have the commission form of government. Austin, the State capital, sent its efficient Mayor, Ira H. Evans, to Galveston and Houston to ascertain the facts. His report was full and complete and has been adopted by the capital city, while the city of El Paso on January 12th, 1907, also adopted the new plan, with a Mayor and four Commissioners to control that city in the future. Many cities of the United States are asking the mayors of Houston and Galveston for the facts as to its success, and inquiries have been received from several foreign countries. The recent endorsement by their own citizens is the most convincing and emphatic answer. Galveston nominated by petition of a majority of her voters the same board that have served her so well for six years, and they were elected on May 14th by an almost unanimous vote. Mayor Rice and the four Commissioners who had served Houston so well were renominated for election, and on the 6th of March, 1907, received 76 per cent. of the whole vote, the entire opposition receiving only 24 per cent. Since Mr. Rice was formerly Mayor under the old régime the advantage of the new system can be seen by direct comparison. There could be no better vote of confidence than this by the two cities, after Galveston having tried it successfully for nearly six years and Houston for two years.

In Texas all changes in city charters are made by act of the Legislature. The Houston charter originally proposed was drawn in 1903 by one of Texas's most prominent attorneys, then a member of the City Council, Hon. Edgar Watkins, who had made a very close study of municipal government. The charter was defeated in the Senate, but was passed by the succeeding Legislature, accepted by City Attorney Stone with some slight changes, and became the law in 1905, when the new order of things commenced.

Mr. Watkins states that, "while ours is called the commission form, it is generally known as the Federal form, because in ours the commission is elected instead of appointed, and is more nearly related to the Federal system of municipal government." There is one thing not yet entirely settled, that is, what amounts the Mayor and Commissioners shall receive as compensation and how much of their time shall be given to the service of the city. Hon. E. R. Cheeseborough, of Galveston, who has been a large factor in its development, insists that Galveston's plan of paying the Mayor

EDGAR WATKINS,
Who drafted the first Commission Charter for Houston.

and four Commissioners a moderate compensation and allowing them to use whatever time in their judgment is required, secures for the city a higher grade of business ability. Galveston pays her Mayor $2,000 a year and the Commissioners $1,200 each. Houston pays the Mayor $4,000 and the Commissioners $2,400 a year each, and requires that they devote all their time to the work of the city.

These two plans are being worked out by the two cities, and each for the present is entirely satisfied that its plan is the better.

The British Ambassador at Washington, James Bryce, said in his "American Commonwealth":

"There is no denying that the government of cities is the one conspicuous failure of the United States."

It looks as tho the "commission idea" might do something toward making this criticism no longer valid. In closing his recent series of lectures at Columbia University on American Government, President Woodrow Wilson, of Princeton, commended this plan of municipal administration in the following words:

"There is in Texas one of the best governed cities in America. For a long time this city had tried the old Whig plan of government on the theory of the preservation of the balance of power and had drawn up an elaborate plan for carrying out this system. There were all sorts of checks and balances applied, and yet the government of the city was pronounced a failure. It was then changed so that the responsibility for the government of the city rested in the hands of five persons, who might appoint whom they pleased to carry out their orders. . . . If you had only five persons to govern New York you would need no political machine in this city. If New York was divided into five districts, with a man at the head of each one who was responsible for what happens there, and the constituents of one should become dissatisfied and turn him out of office, the qualms of conscience that would pass through the other four would go a long way toward keeping them in the path of duty."

The Battle of the Bears

BY EGERTON R. YOUNG

[The writer of this article is well known as the author of "My Dogs in the North Land," "Hector, My Dog," "By Canoe and Dog Train," "On the Indian Trail," etc.—EDITOR.]

"CHIST! Oomah! Look there!" Thus whispered Curlyhead in two languages.

My gazing had been in another direction, and so before I could see what had excited my Indian canoemen, with their strong paddles they had arrested the onward movement of our canoe and had paddled back behind a great rock.

"What is the matter now?" I asked, for, from my lack of alertness or duller vision, I had failed to observe anything unusual. But these keen-eyed hunters, whose very existence often depended upon their alertness, had caught the one glimpse for which they had been eagerly looking. It was that of a great black bear far ahead of us, sunning himself on the shore.

We had had signs of bear during the last two or three days. Not only were there numerous tracks on the sandy shores of the different lakes and rivers, but at several points where the whitefish, pike, mullets, goldeyes and other fish are abundant in the waters we found the fishing grounds, or rather flat rocks, on which the clever bears seat themselves, from which, with a good deal of skill and cleverness, they succeed in throwing out of the water, with their long arm-like forepaws, numbers of the finny tribe.

Bears are very fond of fish, but they are more or less fastidious in eating them according to the quantity they capture. When a bear goes fishing, he does not generally, unless ravenously hungry, eat the first fish he captures. If he thinks he has secured a fishing spot, where his sharp, keen eyes, even if they are small ones, tell him that fish are here plentiful today, he patiently continues fishing, sometimes for hours, until he has skilfully thrown a goodly number of them out on the shore. His preference among all is the delicious whitefish. If at one fishing he is fortunate enough to catch a number of them, he is so dainty in his tastes that he will only bite out and eat the rich oily part of the fish just back of the head. If he has not caught a sufficient number to furnish him a hearty meal on those favorite parts he also eats the next best portions.

If his fishing luck has been poor that day and he has caught but few, he greedily devours them all, with the exception, perhaps, of a head or two, and it may be some tails and bones.

Thus it was that the Indian hunters, as they found these various places, where the bears had been fishing, and then dining, could always tell by the remains of the dinner what success they had had in their last fishing at that spot.

As I have mentioned, the watchful, experienced eyes of my Indians had detected several of these fishing rocks and dining-rooms of the bear, during our canoeing of the previous days, and so this early morning they were on the alert for a sight of these clever fish-catching bears. And now sure enough here was one of them, and a fine handsome fellow he was, as noiselessly gliding round the shoulder of the big rock, we surveyed him at our leisure. My telescope, which made my sight-seeing about equal to that of the Indians with their naked eyes, enabled me to see him perfectly, as there, at that early morning hour, he, after his night's rest, rolled himself about lazily in the sand like a great black Newfoundland dog. He was evidently in good humor and not hungry; and my men said, as they watched him, that he must surely be the bear whose fishing rock we had found the previous evening not many miles in our rear. As a matter of precaution bears do not generally sleep near where they have been fishing even if they have left there some fish that they could not devour. They prefer their fish fresh in the season, and, having satisfied themselves, and indifferent as to the future, they generally go away some distance ere

they cuddle down to sleep in a cosy spot, exactly as does a dog. Contrary as it may seem to the impression of many, the black bear is naturally a peaceful animal and does not generally begin a quarrel unless he has some good reason for it. He is timid and alert and harder to approach than is a deer. Meet him unexpectedly on a trail in the forest, and he is as frightened as you are; and unless he is provoked by your wounding him, for he is very quick tempered, or by a great display of cowardice on your part, you will find him delighted with any reasonable excuse for retiring from your presence, with all the alertness possible, consistent with his ideas of safety. For some time we watched the bear's antics as he rolled himself about in the warm sand and then by way of variation sat up on his haunches, and with his forepaws struck at the deer-flies and other similar pests that worried him.

Lest we should be discovered, or our presence even suspected by him, we again drew back behind the rock. There my men discussed the best means for his capture. I mildly protested against the delay. I said that a half day at least would be lost, and then game more agreeable to our taste than bear's meat had been so abundant that our canoe was well filled with the choicest of meat. I also added, that even if they did succeed in killing him, his skin would not be nearly so valuable now as it would be some months hence in the colder weather.

When my words and requests were emphatic, they were always listened to by my Indians and promptly carried out. But today, somehow or other, they seemed to lack the snap which always brought the prompt compliance with them, and these men, quick to read me, said, with the merest twinkle of the eye: "Ookemou (master), wish to go on or see a bear hunt?" When there is a disposition to surrender we are easily conquered. So I capitulated and said: "Well, show me a first class one, and be quick about it."

The first thing they did was to withdraw the charges of duck-shot from their guns and reload them with bullets. Their flint guns will throw a ball about a hundred yards as well as an ordinary rifle. My Martini-Henry rifle was charged with a fresh cartridge, while my men gave a quick glance at their sheath knives to see that they were in perfect condition, for in a bear fight no one knows what may happen.

The next thing now was to get near that bear. This was no easy matter. Such was the nature of the muskegs or swamp behind him that there was no possibility of getting at him in the rear. There was, however, a small rocky island not more than sixty or seventy yards from the sandy beach on which he was now resting. The Indians, knowing the restless nature of bears, said that it was hardly likely that he would remain here very long, but they would try any way a scheme that might possibly work. So we began at once to carry it out. We paddled back a little further up the river and then quietly landed on the shore on the opposite side of the river from the bear. From this place where we landed we made a portage by carrying our canoe and its contents along in the forest parallel to the river but well out of sight and scent of the bear. When directly opposite that little island, which was now between us and the bear, we noiselessly launched and loaded our canoe and quietly paddled across the river and landed on that island on the opposite side from the bear and therefore out of his sight.

Hardly had we landed and secured our canoe and then taken possession of our guns, before we heard the angry: "Woof! Woof!" of the bear. Thinking that in some way or other he had got some knowledge of us, we crouched flat on the ground. My Indians were surprised and perplexed. The wind was dead in our faces, so he had not got any scent of us and they were sure they had made no noise that could have been heard. So we lay low and waited. But we had not long to wait. The "Woofs! Woofs!" were repeated again and again, and so Curlyhead, our most experienced bear hunter, quietly crawled forward to see what was the matter.

As these ominous sounds were still heard we waited with some impatience for his return. The gleam of the hunter was in his eye when he, noiselessly like a snake, crawled between us and reported what he had seen. His story was that the bear, which he had already seen,

was still about where he had first observed him on the sand, and that coming slowly toward him was a family of black bears consisting of the father and mother bear and a couple of cubs, about four or five months old. It was evident by the way that the two male bears were snarling at each other that they were enemies and, perhaps, had been rivals, and anyway a big fight would doubtless soon take place between them. He also added, from his experience of bears' battles, that as they were now so wild at each other they would not be so alert in watching against other enemies.

"We can carefully get higher up among the rocks and see the battle and then fire when we think best. But," he added, "be very careful for that old mother bear may act as sentinel and discover us if we give her a chance."

Strange, is it not, how some things excite us? Do what I could, I could not keep my heart from loud thumping or my breath from coming fast and hard. Christian or heathen, what is it in us that at the prospect of such a fight throws us into such agitation? It was not any idea of danger; for here on this island, heavily armed, we were absolutely safe. If those bears got one sight or scent of us they would rush away as speedily as the most timid deer. Yet here I was strung up with this almost uncontrollable excitement, as holding on to my rifle, I carefully crawled along under cover of the rocks ahead. We reached our points of observation before the battle began.

It was evident, Curlyhead whispered to me, that they were old fighters, who had met before, as like experienced gladiators they seemed to wait for an unguarded moment on the part of each other.

In the meantime the mother bear had settled down on her haunches on the sand in utter indifference as regards the fight. When either of her cubs, as they frolicked and wrestled with each other, happened to come near her, she seemed to delight in giving it a cuff that tumbled it over in the sand. Warily moving around on their hind legs, the two great bears kept up their growlings, evidently getting more angry and exasperated with each other, but each loth to begin the conflict. A quiet laugh from Curlyhead as we called him, but his right name was Mache-que-quo-nape, who was crouched close beside me, almost startled me. Quietly I listened while he whispered:

"Those old bears are just jawing each other. They both wanted the same wife. They had a big fight once before about her, and as one bear in the fight got a bad bite that made him lame, the other fellow ran off with her. We Indians," added Curlyhead, "say that the bear, because his paw is so like the hand, has a little human in him, and so there those two bears are scrapping just like two men about a woman." And again he chuckled quietly to himself, for he had had his own troubles.

How much more of this quaint Indian lore I would have heard I know not if it had not been abruptly brought to a close, for now the two bears suddenly sprang at each other and were locked in the terrible embraces of each other's great muscular arms. It was an awful struggle, and even my seasoned Indians could not keep from being intensely excited. Standing on their hind feet and wary, the bears struggled in the greatest wrestling match imaginable. The grip they had on each other was what the boys call a back-hold and of equal advantage, as each bear had one forearm under and the other over his opponent. As they put forth their enormous strength it did not seem to us that their efforts were so much directed to down each other as to try to squeeze out the very life. The power of the hug of a bear has enlivened and electrified many a yarn, and has to many a poor hunter been his death or nearly so. And now here to see two great, muscular, full-grown bears, full of jealous hate, practising these hugs on each other—well, it was a sight but seldom seen.

Strange to say, they did not use their teeth much on each other. They both seemed to hope that the hug trick would do its work. But as carefully balancing themselves on their hind feet, which they kept wide apart, as they continued the desperate struggle, they seemed both to realize that some other method of fighting was necessary, and especially as they were so horribly enraged. So in a short

time they began most vigorously to tear at each other's head and neck as well as they could, altho not for a moment letting go their grip on each other.

Tough as bearskin is, it could not stand this very long, and so the end came very suddenly. All at once we noticed that the great forearms of the bear that had come with the family fell limp by his sides and then he quickly sank on the sands. The other bear, loosening his grip, watchfully stood over him as tho suspecting a trick, but as there was no movement beyond some convulsive jerkings he drew back a yard or two and watched him to his death. Then he moved away to the female bear and her cubs. A little conversation and some mutual explanation doubtless took place and then they began moving away.

My Indians wanted to fire at them, but I positively forbade them. "Fire your guns to hurry them off but do not hit them," I said, and raising my own rifle I started the music by sending my bullet close enough to make the sand fly near them. The Indians also fired and away sped a newly organized or reorganized bear family.

We hurried back to our canoe and when we reached the dead bear we found that his opponent, with his sharp teeth, had cut thru his jugular vein, and so he had bled until exhausted, and then fell, as we saw him, on the sand.

BRADFORD, ONT.

A Nova Scotian's Notion of Canada

BY EDWARD W. NICHOLS

THERE is much truth in what a critic says of us in THE INDEPENDENT of May 30th. Undoubtedly Canada does not today occupy that position to which her people and her natural resources entitle her. Undoubtedly politics is with us too much of a dirty party game. Undoubtedly the newspapers are in far too many cases actuated by party spirit rather than by public spirit. It may even be that, tho condemned and deplored by the great bulk of our Canadians, foolish caste prejudices exist in certain quarters. And just as undoubtedly there is a strong, true, democratic Canadian spirit which begins to make itself felt in Canada, and will ultimately raise her to her rightful position among the nations.

Let us consider the Canadian political situation, the Canadian press and the Canadian universities.

It cannot be necessary at this time to instruct readers of THE INDEPENDENT as to the Canadian constitution. The government is a perfect democracy in form and fact, except that we employ an English Governor-General, whom Mr. Givens sneers at as a social figurehead. Precisely what the functions of a social figurehead may be I am unable to determine; but there are some duties and responsibilities incumbent upon the Governor-General which, properly executed, are of great value to Canada. Briefly, he represents the Imperial Idea, and for this service receives his wage of $50,000 per annum. For this sum Canada, in case of need, has the use of all the military resources of the British Empire. It is hard to see how she could maintain an equally efficient navy for that sum; and disarmament is at present an academic question. There is much misapprehension in some quarters regarding this matter of imperial connection. Six years ago I was asked by a refined and cultured lady, a graduate of a State normal school: "Have you a Parliament in Canada, or are your laws made for you in England?"

The difficulty with Canadians has been not so much that lack of national spirit or love of antiquated British institutions imputed to them as absence of interest in things political in any broad sense at all. It must be remembered that Canada is only forty years old, and that three-fifths of her scanty population are to be found

in the rural districts. Political problems have not pressed the farmer greatly in years past, and he has been free to pursue the even tenor of his way without regard to questions of statecraft. But this condition is passing. Those who have watched the course of events in Canada during the past year can readily discern the waking of the political consciousness of the nation, and with that the political conscience. Carelessness of public opinion, barefaced robbery of the public funds, and scandalous immorality on the part of both great parties are believed to exist at Ottawa. Surely discouraging! But the hopeful sign is that the offenders and suspects are being brought to trial. The people are awakening, and the result is not difficult to foretell.

When I consider the political press I confess the justice of Mr. Givens' censure. So far as I am aware, there is not a clean, decent party paper in Canada. There are, further, small weeklies which, nominally independent, are, under any administration, enlisted under the Government banner, and kept there by sops of political patronage. But there are some notable exceptions. Take, for instance, the Montreal *Herald,* a weekly family magazine which has probably the widest circulation of any paper in Canada. This journal is eminently non-partisan and outspoken in condemnation of political rascality in any party. Perhaps it is the greatest molder of the opinions of the country people that exists in Canada today.

In the matter of universities our critic has spoken hastily and without thought. His words are:

> "In respect to the Canadian universities, what are the conditions? What, if not that most of the professors are old country men from England or Scotland, born abroad and educated abroad? They come to Canada knowing nothing of it save that it is an adjunct of Great Britain. The consequence more often than not is that they are intolerant, self-opinionative, and, if opposed, more than ever British. It is these men, then, who largely educate the young men of Canada—these foreigners to whom Kipling's question might well be applied: 'What do they know of England who only England know?'"

Let us look at the facts. Take, for example, the largest university in the Maritime Provinces—Dalhousie College—located in the old imperial stronghold of Halifax, in the ancient and backward Province of Nova Scotia. The power in this institution lies in the hands of the Senate, a body composed of the leading professors of the different faculties. It comprises about a dozen men in actual service. Two of these men are Americans born and bred, the rest Canadians. Every one began his education in a university of Canada or the United States. Several of them had the misfortune to finish their courses in Europe; but I believe that this habit is sometimes known south of the border. Analyze the conditions at Queens, Toronto, McGill, and the result will not be greatly different. In the face of these facts the value of Mr. Givens's statement is seen.

It may be that the young man is offered a better chance in the United States than in this country. But in most cases that I have been able to observe the son who has remained at home is as well off as the one who has "gone to the States." Our industrial development is hardly as backward as has been represented. The value of manufactured goods, for instance, has climbed from four to seven hundred millions in the last half dozen years. It may be that Canada is an old man's land. In that case, what of Premier McBride, of British Columbia; Premier Robinson, of New Brunswick; President Falconer, of Toronto University; Rutherford, of McGill? It should be remembered, also, that, if some of our leading politicians are getting old, they have been in office for eleven years: even so, several members of the Cabinet have not yet reached sixty.

The statement that "Quebec is French and the rest of Canada British" is liable to misinterpretation. Quebec, in so far as it is French, is French of the old régime. With modern French ideas it has no sympathy. There is Canadian spirit in Quebec as elsewhere in Canada, of course without British sentiment. The interests of the Quebec Frenchman lie wholly on this side of the Atlantic.

Upon the whole, we are glad of criticism. We would be better for another Sam Slick, who would not confine himself to the Bluenose, but would deal with all Canada. But we think it no small thing, tho our critic has dismissed it with a word, that our system of finance is un-

excelled, our laws well administered, our judiciary incorruptible, and our people "sober, honest, industrious, moral and God-fearing." We think that, given the personality of our people, the prestige of our nation will follow. We are a young nation. We make mistakes. We are afflicted with the modern craze for wealth and notoriety. We have old fogies always with us. But underneath all our ebullitions of political folly there is a deep, strong, true democratic spirit of a nation of toilers. We care not much for the quantity of our people, but for their quality. Our confederation is a success, a young democracy within an ancient empire, an empire whose ideals are daily becoming more democratic.

ACACIAVILLE, DIGBY COUNTY, NOVA SCOTIA.

The Race Question in the Forty-sixth State

BY L. J. ABBOTT

[Mr. Abbott is a graduate of Columbia University. In the recent primary campaign to nominate candidates for office under the new constitution he visited the principal towns in both Territories.—EDITOR.]

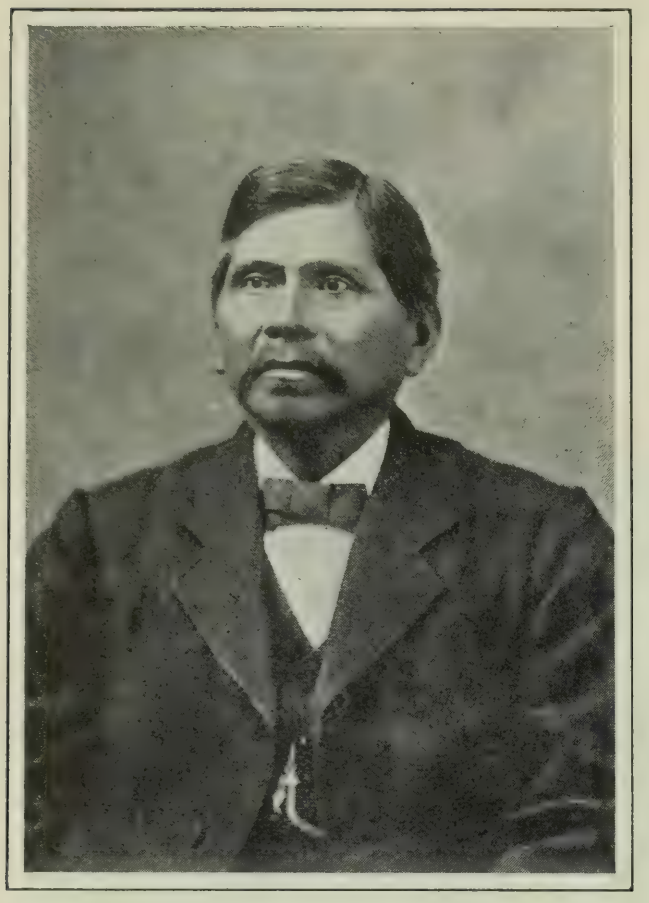
EARLY in the last century, dreamers, in Congress and elsewhere, thought of founding somewhere in the Great West an Indian empire. Eventually a portion of the unoccupied domain west of the Mississippi was set aside as a home for all the Indian tribes of the nation. The idea was that those tribes could be moved from the various parts of the country and located in this territory, which in time would become a great Indian State.

Roving bands of Cherokees and Chickasaws had begun to enter this region as early as 1800, and the migration of the "Five Civilized Tribes" was finally consummated when the Seminoles were forcibly located between the North and South Canadian rivers in 1843. These tribes, Cherokees, Creeks, Choctaws, Chickasaws and Seminoles, were, in a measure, civilized at the time of their enforced removal from the South Atlantic and Gulf States. They were in a crude way agriculturists, and brought with them to the Indian Territory a considerable number of slaves.

The Five Nations, immediately after settling in the Territory, reorganized their tribal governments, similar in most respects to our State governments. There was a governor, known as "Principal Chief," and a council consisting of two houses. During the Civil War, influenced by the Southern agents among them, and by self-interest, because slaves were held in every tribe, the citizens of the Five Nations very generally sided with the South. All the tribes were left exhausted and decimated by the war; and reconstruction, enforcing the liberation of all slaves, dealt the progressive tribesman a severe blow. Congress also enacted laws requiring the Indians to divide the tribal lands with their ex-slaves. This was bitterly resented by the tribal governments. But in one way or another treaties were imposed upon four of the tribes granting varying amounts of land to the freedom of the respective nations. The Chickasaws never consented to any such treaty, but, nevertheless, they were compelled to allow every ex-slave, or his descendants, forty acres of land. The dispute was carried into the Court of Claims, and this tribe alone recovered money damages for the land thus forcibly appropriated.

But soon the blacks were accepted as an integral portion of the Creek and Seminole tribes, for long previous to their settlement in the Indian Territory members of these tribes had intermarried with their negroes. Intermarriage became common, so that now (I have it on the best authority) there is not a

Seminole family that is entirely free from negro blood; and there are but three Creek families, some make it two, that are of pure blood. Thus practically every negro in the Creek nation is an "Indian." You can offend a black no easier than by denying his Indian parentage. This is so elsewhere thruout Oklahoma. Every negro that can possibly maintain his contention insists that he is an "Indian." In this way he feels that he can avoid some of the antipathy that meets his race at every turn.



A GROUP OF CREEK INDIANS WHO SHOW AN UNMISTAKABLE STRAIN OF NEGRO BLOOD.

And it must be confessed that the negro Indian, or Zambo, as such a racial admixture is termed in Spanish America, does occupy a more influential position in Oklahoma society than the mulatto or pure-blood African. This can partially be explained from the fact that these Creek and Seminole Zambos have large landed interests, and that they are a decided factor in the politics of the new State. But the strain of negro blood in their veins puts a social barrier upon all the tribe. There is a small minority in each tribe that has so slight a strain of negro blood that it is called "Indian" and overlooked. This minority is not entirely ostracized by the whites, but it has become an event of rare occurrence when a white man or woman marries into either the Creek or the Seminole tribe.

I know of a Creek, who, so far as one could judge by appearances, is a white man. He undertook to prove his Indian blood in the Creek courts so as to be allotted land in severalty. The investigation developed the fact that he was one-sixteenth negro and had no Creek blood at all. Immediately his wife left him, his business was ruined, he was a marked man, with no future other than the future a negro of intelligence and capacity can hope for within that race. That woman would have had to accept the social position of a Creek negro had she remained that merchant's wife. As it was, her children had a stain that soap would not wash out, nor society forgive, in the South.

There were fourteen Indians and "inter-married citizens" elected to the

GOVERNOR WRIGHT.

Principal Chief of the Choctaw Nation in the early eighties. A full-blood Choctaw.

recent Oklahoma constitutional convention. Not one of them was a Creek or Seminole, altho these two tribes constitute one-sixth of the Indians of the two territories.

The Cherokees, Choctaws and Chickasaws, the remaining tribes of the Five Nations, seldom (one can almost say never) mixt their blood with the negro. On the other hand they early contracted marital relations with some of the best English and Scotch blood of the South. This is particularly true of the Cherokees. No effort was made to maintain the pure Indian blood. The contrary, especially of recent years, has been the case. Full bloods now seldom marry full bloods; and an "Indian citizen," with only the smallest fraction of Indian blood in his veins, almost invariably seeks as a life partner a "non-citizen"; not infrequently some school ma'am or milliner employed in one of the numerous thriving cities of the Territory. It will be but a generation or two until there will be no Indians of the five civilized tribes. The Cherokees, Choctaws and Chickasaws will have lost their identity in the white race. Last winter I had Choctaw children in my school who were one one hundred and twenty-eighth Indian, and that was all. Had not this modicum of Choctaw blood given each one of them four hundred acres of as good land as the sun shines upon, you can judge, as well as I, how much Indian they would have been. But the Creek and Seminoles, except a few instances where Caucasian

A TYPICAL CHICKASAW BELLE.

This lady has enough Indian blood to be enrolled as a "citizen" and to be allotted land by the Dawes Commission.

blood largely predominates, will be counted as negroes.

What is true of the civilized Indians of the Eastern Territory is also true of the blanket Indians of Oklahoma. As soon as Indian children take up civilized ways almost invariably they marry into the white race. It is quite possible that the Indian's dowry of a bottom farm, that is inalienable and exempt from tax, ma-

terially assists in blinding loving eyes never famous for accuracy of vision.

But as I have explained the negro of Indian Territory is also a land-owner. The ex-slaves of the Five Tribes are protected in their holdings as are the Indians. And in the Oklahoma, or Western half of the new State, the negro was as free to homestead land as the whites. In the various "openings" we find considerable numbers of them obtaining claims. So in both divisions of the State there are probably a larger percentage of negroes who own their own homes and are in comfortable circumstances than elsewhere in the United States. So it will be seen that Oklahoma's negro population is hardly to be termed improvident. More than this it is not numerous. In both Territories, with an approximate population of two million, there is not to exceed one hundred thousand negroes, even if the Creek and Seminole Indians are classified with them. The Census of 1900 gives the colored population of Indian Territory as 36,870, and of Oklahoma as 18,831.

A FULL-BLOOD CHICKASAW.
An Indian that civilization has not injured.

The question then presents itself: Why is there such bitter hostility to the negro in these Territories? The recent election for constitutional delegates chiefly hinged on the question of separate schools, separate railway coaches and separate waiting rooms for the blacks. Hardly a candidate for delegate, be he Kansas Republican or Texas Democrat, who did not base his campaign on these three "issues." Because the Democrats were counted upon more fully to live up to their pre-election promises in regard to negro legislation, they won a sweeping victory. But 12 Republican delegates were successful as against 99 Democrats.

When the Constitutional Convention met these three pet measures of the ardent negrophobes were quickly enacted. The separate school provision is in accordance with the enabling act. A system of colored schools has been in operation in Oklahoma Territory for a decade or more. It was accepted by every one as a provision of the new State's well fixt policy. But the separate coach and waiting room provision was enacted with much less assurance. The Republican minority failed to vote either way on the proposition, so as to take advantage of any set of circumstances that would be apt to turn them votes (colored or otherwise) in the election for State officials, which is to be held this fall.

Then an alarm was sounded at Washington by Southern Senators and Congressmen. It was averred that if a separate coach and waiting room provision were written into the Oklahoma constitution, President Roosevelt would refuse to issue the necessary proclamation and statehood would fail. It was also point ed out that these race segregation measures are just as effective when merely statutory. Not a State now enforcing them has such constitutional provisions. Just how these Democratic Senators and Congressmen got their information was never explained; but evidently the Democratic majority at Guthrie accepted the Washington view of the matter, and the "Jim Crow" provisions of the constitution were hastily repealed. The Republicans now allege that the repeal was merely a political trick of the Democrats

so that they can continue to win elections with "Jim Crow's" able assistance.

Yet both among Northern Republicans and Southern Democrats there is a deep-seated aversion to the negro. Race prejudices are most difficult to account for. We find the Mongolian of the Pacific Coast hated and legislated against because he is abstemious, frugal and industrious. An Oklahoman will give you exactly opposite reasons for disliking the negro. He is immoral, improvident, lazy and with all at times inclined to be impudent. After talking with many men, college graduates, professors and Northern men of education and station, I have yet to find the Oklahoman who does not admit a strong personal antipathy toward the blacks. That is, they much prefer not to come in personal contact with negroes, and regard the so-called "white towns" of the Territories as progressive, for the single reason that negroes are not allowed to reside there.

The negro's participation in the politics of the Territories gets him into trouble, and gets him little else. The slum wards of most cities, in both Territories, have a considerable negro population. The Republicans, generally slightly in the minority, on that one day hobnob with the negro ward boss. The usual methods to carry such wards are employed. A single negro is sometimes —not frequently—nominated for some unremunerative office, and regularly defeated by the very men who put him up. But the Democratic ward-heeler, who can never successfully handle this contingent, resents such an intrusion of a solid black vote into his own game of grab and graft. Thus more fuel is added to the fire of race hatred, and the negro gets no benefit from his participation in the election. In the entire history of Oklahoma Territory but one negro has held an office to which there was attached a salary of any proportions.

The negro is provided with good but separate common schools. At Langston, Oklahoma maintains a colored normal and agricultural college that is amply supplied with funds. When the negro will work he can readily find employment at excellent wages. The white people of the new State appreciate that he is here and bound to stay here. But it is felt, and here I believe I voice the senti-

ment of ninety-nine per cent. of the State's white population, that he is not to crowd himself upon the whites; not only in the schoolroom, the railway coach and waiting-room, but in any walk of life.

But why is the negro ostracized, while the Indian, more numerous than the negro, is everywhere met with friendly toleration, no social barrier being raised against him? Is it the stigma of recent slavery that makes the difference? Is it because the Indian blood is quickly lost in the white, while the negro blood clings tenaciously? Is it because the Indian was satisfied with his own social environment that no ban was put upon his intercourse with the whites?

The full-blood Indian is quite as improvident and as slothful as the negro; however, he is much less obtrusive. In both Territories there is but one tribe of Indians—the Apaches—that, so far as I know, actually farms except by proxy. They are prisoners of war at Fort Sill. The Government agent compels them to work, so no particular credit is due the red men for this exceptional industry. But any one of these Apache prisoners, or the most ignorant Wichita, can hope for more in Oklahoma than the best educated negro that the new State can produce.

At the recent primary election an eighth blood Cherokee was nominated by the Democrats for the United States Senate; a fourth blood Choctaw received the party endorsement for Congress—this, mind you, in both cases, chiefly by white votes. But in Oklahoma the negro can hope for no political or social position that requires white encouragement.

SULPHUR, INDIAN TERRITORY.

The Pleasure of the Hour

BY IVAN SWIFT

WHEN a curtain in the sky
With the sun a-seeping thru
Is a-taunting me to try
What a fisherman can do—
Would you have me stay at home
Reading poems in a tome
While I water at the mouth and live a lie?

For the rattle of the reel
And the running of the line
Is the filling of the creel
With the pleasure of the hour when we dine!

I *have* a tender feeling for the fish,
And I've got to be forgiven for a lot;
But I love 'em all to pieces—in the dish,
And my feeling's sort of special when they're hot.
Oh, the very best of wishes
For the sorry little fishes—
And a hoping they'll be happy in the pot!

For the r-r-rattle of the reel
And the r-r-running of the line
Is the filling of the creel
With the pleasure of the hour when we dine!

HARBOR SPRINGS, MICH.

The Luck of the Laughing Figurehead

BY THEODORE ROBERTS

CAPTAIN JOHN PARKIN had the "Mistletoe" built in Liverpool, every timber and stick of her to suit his taste. She was a barkentine, of two hundred and sixty tons, oak built, with teak rails, and mahogany finishings aft. As soon as she was rigged and ready, he took aboard a mixt freight, and crossed the North Atlantic to St. John's, Newfoundland. It was a rough passage; but the new barkentine was as clever and sweet to handle as any craft Parkin had ever sailed in—and he had been following the sea for twenty-six years.

There were many people down at the wharf to see the "Mistletoe" come in; and in front of them all, waving his cane in one hand and his hat in the other, stood Mr. Livingstone Beale, head of the firm of Beale & Co., and owner of four-sevenths of the new barkentine. Captain Parkin owned the other three-sevenths. Mr. Beale lost no time in clambering aboard, and was warmly received by the captain, on the poop.

"She's a miracle," exclaimed Parkin. "Look at her model, man. Every other craft afloat is either a tub or a cigar to her."

The merchant chuckled with delight at the other's enthusiasm. He was always jovial, as became his appearance and condition, but seldom enthusiastic. He was a cheerful philosopher. Parkin, on the other hand, was very serious in his outlook on things and life. What he found to be good delighted him boyishly; what he found to be evil depressed him, and could depend on his unwavering opposition. These two were friends of long years' standing.

"You're not a day over twenty," laughed Beale. "And if she suits you, Jack, she suits me."

They went below, and the captain placed refreshments on the table.

"Here's to her; and may you sail her till she falls to pieces of old age," said the merchant, draining his glass.

"Here's to her," repeated the sailor, and raised his glass with quite an air of reverence and devotion.

"That is capital port," remarked Mr. Beale.

"She's the cleverest thing afloat," replied Parkin.

The other sighed, realizing, for the hundredth time, that there was no use in speaking to Parkin of anything but ships, during his first day ashore.

"Why hasn't she a figurehead?" he asked. "I like them. They appeal to one's imagination."

"So they do," admitted the captain.

"If I were a poet," said the merchant, leaning back on the cushioned locker and gazing reflectively at a second glass of port, "I'd write a poem about a ship's figurehead. Think of the wonderful things"—but here his imagination failed him. He had only the vaguest ideas of what these wonderful things might be. He had said enough to catch Parkin, however.

"It is a fine idea," exclaimed the mariner. "I've often thought of something like that, myself—of the wooden eyes gazing down, day and night, voyage after voyage, into calms and squalls and silver fire, counting and forgetting and counting again the innumerable valleys of the sea. We must get a figurehead for the 'Mistletoe!'"

"I have something that might do. Come up and dine with me, tonight, and I'll show it to you," said Mr. Beale.

The two friends dined comfortably, in a high room lighted only by the four candles on the table. Both were bachelors. There was that about Beale—perhaps his urbanity—that suggested that he had maintained his state of single blessedness with his eyes wide open; that he had considered the matter carefully, had decided on his course, and was without regrets or misgivings. Parkin gave a different impression. One would say that his chances of remaining a bachelor at forty-three were no better than they

had been at twenty. The fate of man—or whatever it is called—had simply overlooked him; but no one could doubt that the heart so open to the charms of ships and the sea was accessible to love of a more disturbing nature. Of all this Parkin himself was blissfully unconscious.

The dinner was a capital one, accompanied by wines as sound as the mahogany under the damask, but a deal more seductive. The talk was natural and pleasant, but not unduly absorbing. The coffee was just what coffee should be; and after the first sip, each leaned forward and lit his cigar at the candles.

It must have been fully half an hour later that the sailor requested his host to exhibit the article which he had suggested might serve as a figurehead for the new barkentine.

"I suppose it's a mermaid, or Neptune, or something of that kind," he said.

Mr. Beale arose, with one of the branched candlesticks in his hand.

"I don't know what you'd call it," he replied. "It reached me only three days ago, with a lot of other truck, from England. Was left me by an uncle, who was a collector of queer things and no end of a traveler. Come and have a look at it."

He led the way to a large, unfurnished and unlighted room. By the circumscribed illumination of the candles in his hand, the apartment appeared vast and mysterious. The floor was cluttered with all manner of old lumber, broken furniture, dusty and worthless books, and packing-boxes closed and open, empty and full.

"Shocking mess," exclaimed Beale. "I must have it tidied up one of these days."

He picked his way to the farther side of the room, the sailor following, with laments for the unshipshape state of the place and the damage sustained by his shins.

"Here it is," said Beale, halting and advancing the candlestick.

Parkin, looking over his friend's shoulder, saw, standing against the unpapered wall, a figure carved from dark wood that shone like polished mahogany. It stood erect, but was not more than four feet in hight. The big head was set low on the heavy shoulders, and the hands were crossed on the breast. Parkin advanced, took the light from Beale and examined the figure closely.

"I don't like his looks," he said. "I don't take to the cut of his jib. I'll swear he's a fetish, or something of that kind." Then: "Where are his eyes?" he asked, indicating the empty sockets with a finger.

"He hasn't any, so far as I know," replied Beale.

"But he has had them. See where the knife, or whatever was used, cut the wood when they were being pried out," said the mariner.

"Make him a new pair, and he'll be worth ten of these hackneyed mermaids, and old gentlemen with crowns and whiskers," rejoined Beale.

"Oh, I suppose he'll do, but I am not in love with him," replied Parkin.

Eyes of blue china were supplied to the image, and it was fastened upon the prow of the "Mistletoe," under the bowsprit. Mr. Tunner, the mate, wanted to paint the thing white and mark it out with gilt. Denis Whalen, the boatswain, objected to it in any color, maintaining that the thing had an ugly mug and a general air of evil contemplation.

"If ye t'ink it be a heathen idol, then what for d'ye want to stick it onto a Christian ship?" he enquired of Mr. Tunner. "If the skipper wants a figurehead, what's his objections to St. Patrick, or Queen Victoria, or one o' they naval heroes like Nelson, or Ben Bolt, or Admiral Neptune?"

"Look-a-here, bo'sun," replied Mr. Tunner, "Neptune wasn't any admiral, no more nor Davy Jones."

Now the boatswain was old enough to be the mate's father, and had sailed the seas before that ambitious young mariner was born. He spat over the port rail and then cast a glance of pained wonderment at the mate.

"There was two Davy Joneses, sir," he said, patiently. "One was a admiral, wot fit in the American Revolution."

"Maybe ye're right, bo'sun," replied Mr. Tunner, who was not an authority on naval history. "Maybe ye're right about Davy Jones; but ye're wrong about Neptune."

"That's as may be," rejoined Whalen, and turned away mournfully.

Early in February the "Mistletoe"

sailed from St. John's with a freight of cured codfish, packed in small barrels or "drums." It was an excellent quality of fish, and was designed for the critical Brazilians. She made an easting from the Narrows in a flurry of sleet and more than a capful of wind. Before night the sleet ceased, the wind veered and a fog crawled over the vessel. A patent foghorn was placed on the forecastle head, and the lookout was directed to sound it at stated intervals. Captain Parkin, in oilskins and sea boots, paced the poop, tho the mate had charge of the watch. When the mate went below and the boatswain appeared, Parkin still held to his post.

"A dirty night," remarked the skipper to the boatswain, after a half hour of silence.

"It's that, sir," replied Denis Whalen, drawing breath to expand in elaboration of the subject—but a shout forward brought the polite conversation to an end. The boatswain dashed down the port ladder, and the captain sprang back beside the man at the wheel. Presently Whalen returned, relieved, but in a very bad humor.

"May the divil fly away with Patsie Keegan," he exclaimed.

"What was the trouble?" asked Parkin. "What was he shouting about?"

"He says he heard somebody laugh out on the bowsprit, right after he'd given a toot on the horn," replied the boatswain.

"Somebody laugh? Somebody on the bowsprit? What's wrong with the man?"

"I couldn't name ye all there's wrong with Patsie Keegan, sir," replied Whalen, "an' now he's thinkin' one o' they mermaids has fell in love with him an' is aclimbin' aboard to get him."

"He is not insane. He must have heard something," said the skipper.

"I didn't hear nothin', nor I didn't see nothing," replied the boatswain.

Parkin descended to the main deck and made his way forward, thru the darkness. A lamp burned smokily in the forecastle and both watches were clustered outside.

"What is all this about?" he asked.

A figure descended from the mist beyond the big windlass. It was Keegan.

"I heard somethin', sir, an' so I let a yell out o' me," he said, dejectedly.

"What did you hear?" asked the skipper.

"It sounded like a man laughin'," replied the A. B.

"Who else is on lookout?"

"Tom Mann, sir."

"Did you hear anything, Tom?"

"No, sir; I can't rightly say that I did. What with the row Patsie was makin' on that there patent horn, an' the yell he let out, an' me own thoughts, I didn't hear nothin'," replied Mann.

Parkin turned to Keegan.

"You must have been dreaming," he said.

"Maybe ye're right, sir," replied Keegan; "but I was makin' noise enough on that old foghorn to keep myself awake. I'd just pumped a bellow out o' it an' was straightenin' up when I heard —what I heard."

"Nonsense," replied the skipper. "Some one was talking in the fo'castle and the echo came back from the jibs."

"I hope ye're right, sir," murmured Patsie, dismally.

The morning broke clear, and was followed by ten days of fine weather; and for ten days the crew kept a close and embarrassing watch on Patsie Keegan, to see what was going to happen to him. Also, they told stories of sailors who had heard just such laughter out of the storm—laughter of devils or mermaids —and how those sailors had all gone to watery graves, sooner or later. But the ten days past without any mishap to Patsie. Then the "Mistletoe" was treated to half a gale of wind, and, in the darkest hour of the night and the storm, the mysterious laughter was heard again, this time by both men on lookout duty. They stood for a second, staring forward; then, as by one impulse, they turned, leapt to the deck and raced aft.

"We heard it," they stammered to the captain.

"Back to your posts," he cried, in a voice of wrath.

In the morning, when the barkentine was pitching along over a tumbling sea, but with a clear sky overhead, the captain sent for Denis Whalen.

"Bo'sun, you have heard of what happened last night?" he said.

Whalen nodded.

The other cleared his throat, and in a voice which he strove to make casual, asked: "And what do you make of it?"

"Well, sir," replied Denis, scratching his whiskers reflectively and casting his glance about the cabin, "I don't hold with them as say it be a mermaid. They mermaids be played out, to my way o' thinkin'."

"Then what is it?"

"Why, sir, if ye don't mind me sayin' so, it's all that heathen idol ye've got stuck to her bows."

"Nonsense, bo'sun. Sea birds make all sorts of queer sounds," said Parkin.

"It might be sea birds, true enough, sir," replied the boatswain. "But, if ye want to know what I think, it's that there figurehead."

"Well, bo'sun, if that's the case, the men have nothing to be afraid of," rejoined Parkin. "The old chap can't hurt them, and they'll soon get used to his untimely mirth—if he keeps it up. If not, they'll forget it in time. Just step forward and tell them, confidentially, that you've read in a book that there's nothing so lucky as a talking figurehead. That's all at present, and many thanks."

As soon as the boatswain was gone the captain sat down and stared.

Once more, before the barkentine reached Pernambuco, the mysterious laughter sprang from the darkness beyond the forecastle-head. Three men heard it on that occasion; but as no evil thing seemed to follow the experience, they did not trouble to report it until morning. With but one exception, the crew believed that the voice came from the figurehead. They accepted the boatswain's information as to the luck attendant on a vessel possessing such an unusual appendix—but the boatswain himself secretly doubted the assertion. The exception—the man who would not believe in the unholy mirth of the figurehead—was the cook. He maintained, against all arguments, that a mermaid was following the vessel and that, sooner or later, every man who heard her voice would go to Davy Jones's locker. Perhaps his belief in this view of the matter was strengthened by the fact that it was no part of his duty to stand on the forecastle-head at night. As for Captain Parkin and Mr. Tunner—well, they could make nothing of it. Queer things come to the notice of sailormen; and this was a queer thing.

As soon as the "Mistletoe" was safe alongside the wharf, in the sweltering harbor of Pernambuco, the work of winching out the cargo began. Drum after drum came to light, each showing brown stains along the cracks of the staves.

"What do you make of that, Mr. Tunner?" enquired Captain Parkin, in a voice of amazed displeasure.

"Can't make nothin' of it, sir," replied the mate. "The hatches are tight, an' the drums were stowed away as dry as toast. Ye'll find 'em right enough, deeper down."

But no improvement was found, and the miracle of a spoiled cargo out of a dry hold was disclosed to the ship's company—a cargo not worth half of its anticipated value. Captain Parkin was deeply distressed.

"Why, she is as sound as a bell," he said, "and if any ship can carry fish its a wooden ship. I used to turn better cargoes out of the old 'Walrus,' when she was leaking like a straw hat."

Mr. Tunner agreed with him. The boatswain, however, evinced no surprise at the state of the cargo.

"If ye want to know what's wrong with the fish, sir, I'll tell ye," he said. "The ship's a lady, an' the fish come aboard as dry as my throat; but that there heathen idol has driven its divilments right thru the whole concern, from stem to stern."

Mr. Tunner looked uneasily from the boatswain to the captain. He was a modern seaman, he was, and a certificated navigator, and it would never do for him to agree too suddenly to such an explanation of the trouble. Of course, if the captain saw anything in it, he would give the boatswain's theory his attention.

"Nonsense," exclaimed Parkin. "How could a wooden figure under a bowsprit damage a cargo?"

Mr. Tunner, having his cue, laughed in a supercilious manner.

"T'is nonsense, right enough, sir. I never heard o' such a thing," he said.

Denis Whalen turned on him.

"If I had a shillin' in me box for every thing ye've never heard of," he cried, "I'd buy a bigger vessel nor this one an' use her for a pleasure yat. But I ain't talkin' to you. I'm talkin' to a sailorman, named Captain Parkin, I am.

"Look'ee here, sir," he continued, turning to Parkin, "I'll tell ye, just from one sailorman to another, the place for that there fetish, or idol, or what-not, is slap on the bottom o' the ocean."

The skipper laughed; but with so uncertain and mirthless a note that the boatswain felt a twinge of pity for him.

"Ye've lost good money, sir, along o' that mahogany figurehead. I'll just step for'ard an' cast him loose," he said.

A quick flush spread up to the captain's cheeks. "You'll just step for'ard and mind your own business," he snapped.

As the boatswain walked away, Parkin turned to Mr. Tunner.

"Sailors are fools!" he exclaimed.

The mate nodded.

"Mermaids! heathen idols!" continued Parkin, bitterly. "Didn't they ever see a damaged cargo before?"

"It's a queer thing, tho," ventured Mr. Tunner. "She is tight, hull and hatches, an' the fish was stowed aboard as dry as ever I see. It's queer, I must say, comin' atop o' this laughin' from under the bowsprit."

"Queer," cried the skipper; "of course it's queer. But it's not queer enough to make us behave like children."

He mailed a long letter to Mr. Beale. Three days later, with a ballast of sand and the unpopular figurehead still in place, he sailed northward for Barbados. It was his intention to there take in a freight of molasses.

For five days and nights the "trades" held strong and steady, and the "Mistletoe" slipped along like a racer. Then, with no more than a half hour's warning, a hurricane burst upon the barkentine.

Close-reefed, she drove onward in the fury of the wind, while the dark and the tumult momentarily increased and thickened about her like an enveloping doom. It seemed that the impact of the gale must tear out the masts and crush the decks, or else that the stricken vessel, intact, must be pressed beneath the furious sea. Men clung to whatever they were within reach of—and suddenly, audible to every ear above and against the madness of the wind, sounded a hooting, diabolical peal of laughter.

By dawn the storm had passed, leaving the "Mistletoe" plunging across an outraged sea, under a reefed foresail and one jib. The mizzen mast, deck forecastle and lower and upper topsail yards were in a state of wreckage.

Captain Parkin walked forward to where the crew clustered near the windlass. His face was drawn and his eyes bloodshot from the long watch and anxiety.

"Lads," said he, "this has been an unusual voyage—and an unlucky one. The 'Mistletoe' is a good vessel, and we've sailed her as well as most ships are sailed; but we've had hell's luck, and that's the truth. I'm not pretending to know what the matter is—I'm not wishing to so much as give opinion—but two good men, with cold chisels and hammers, could knock away that figurehead in about fifteen minutes."

"Ye're right, sir," cried the boatswain, and immediately produced the required tools, as if they had been in readiness.

Soon the clicking of the hammers ceased, and the mahogany image dropped from its place and plunged into the trough of the sea directly under the barkentine's forefoot.

"Down she goes," cried the boatswain, climbing back to the reeling deck. A scattered cheer broke from the crew.

"Look there! to port!" cried Mr. Tunner. All faces were turned in time to see the brown figure rise, waist high, from the foaming side of a wave, stare shipward a moment with its blue china eyes, and then sink like a stone.

Eastward the waves rocked against a golden horizon, their million tumbling crests vanishing in the wide but quiet flame. As Parkin gazed afar at the scene, his eyes gladdened by the freshness and motion and color, but his mind brooding heavily over the matter of the figurehead so recently sacrificed to the superstitious fear of himself and his crew, he became conscious of something that was of neither the sunlight nor the water, flashing, vanishing and recurring to his vision. He braced himself more

firmly against the swoop and lift of the deck and raised his binoculars. Quick as thought, the far, weltering horizon and the flaming portals of the day leapt to him. He saw the veinings of foam on the sides of those distant billows, and the black valleys gliding and yawning as if to lure and engulf him. And suddenly, into that tortured place, swooped an open boat, climbing and vanishing and climbing again with a flashing of pigmy oars and a glint of sail.

Two hours later the occupants of the boat were safe aboard the "Mistletoe." There were ten of them all told—six sailors, a cook, a mate, a gray-bearded skipper and his daughter. Captain Parkin received them with a correct blending of sympathy and cordiality in his manner.

"My name's Watson," announced the mariner with the gray beard, "and this is my youngest girl, Mary. We've been knockin' about in that boat a matter of fifty hours, and, by ginger, I'm glad to be out of her."

"Fifty hours?" queried Parkin. "When did the hurricane strike you?"

"No hurricane struck us," replied Watson. The old 'Walrus' caught afire about this time three days ago. We stuck to her as long as we could, but had to quit at last."

Parkin turned to the young woman, who leaned heavily against her father's shoulder. Her eyes were dark with weariness, and her blond hair shone, wind-ruffled, about her pale face. She was taller than the old mariner and far from meager in figure; but there was that in her attitude of fatigue, and even in the oilskin jacket which she wore, suggestive of fragility. Parkin felt a distressing uneasiness at his heart as he looked at her.

"My cabin is at your disposal, Miss Watson," he said.

But the old man was so absorbed with the recollection of the fate of his vessel that he made no motion to help his daughter. Parkin summoned all his courage to his aid and stepped close to her.

"We are pitching frightfully. Let me help you aft," he said.

She loosed her hold on her father, and then the barkentine tried to pitch and roll at the same moment, and she flew into Parkin's arms. He caught her securely, and, masking his embarrassment, bore her swiftly to the door which led thru the messroom to the cabin.

Barbados lay on the nor-western horizon, a low, opalescent cloud. Old Watson was below, smoking his host's cigars and still pondering over the loss of his brigantine. Miss Watson and Captain Parkin sat near the skylight, under the casual eyes of the man at the wheel. They had been talking very softly, and seriously, for some time, and had scarcely lifted their eyes to the distant landfall.

"It was only nine days ago," said the girl.

Parkin turned his shoulder to the steersman.

"Nine years could do no more—and nine minutes were enough," he whispered. They looked into each other's eyes and then at the deck. "Thank God I'm a superstitious sailor, and cut away the old figurehead when I did," he continued. "He was no more than under before I sighted your boat. He laughed in the dark, and spoiled our fish, and knocked us about with a private hurricane; but he is harmless now. It sounds childish, but I cannot help believing that he was a thing of evil."

"Do you think he was responsible for the hurricane?" she asked.

"Yes," he said. And then: "Remember, dear, I am nothing but a simple sailor."

"Indeed, you are deliciously simple," she replied. "Why, Jack, we have that hurricane to thank for — for this. It blew you out of your course—and into ours. So the less you say about the bad luck of that figurehead, the better I'll feel."

"By George! God bless his old, mahogany face!" cried Parkin. And then, not a moment too soon, he remembered the mariner at the wheel.

FREDERICTON, N. B.

Literature

Biology a Science of Experiment

CUVIER classified the sciences into three categories: the sciences of calculation, as pure mathematics, most of astronomy and part of physics; the sciences of experiment, as most of physics and chemistry, and the sciences of observation, as natural history. And in the order as they stand do these different groups of sciences approach exactness and certainty in their claimed facts. The sciences of zoölogy and botany and geology, then, are the least sure as to fact. To make them more certain it is necessary to raise them, if possible, from sciences of mere observation into sciences of experiment and calculation.

About 1880 Carl Semper, the zoölogist of the University of Würzburg, wrote a book called "Animal Life as Affected by the Natural Conditions of Existence" (published in the familiar red-bound International Scientific Series), in which he laid the foundation, or at least pointed the way, to make biology, in part at least, a science of experiment. In 1897 Charles B. Davenport, then instructor in zoölogy in Harvard, now director of the Carnegie Laboratory for Experimental Evolution, gathered together in two volumes under the title "Experimental Morphology" the facts known at that time touching the relation of individual plant and animal reactions to environmental or extrinsic influences. And now comes the latest summary account from Dr. Morgan,* professor of experimental zoölogy in Columbia University, of the status of the study of animals by experiment.

Since Davenport's book several European books have appeared, as Haake's, Maas's and Przibram's, and a journal for the publication of original investigations along this line (*Archiv für Entwicklungs Mechanik*) has been established. Also the general papers of Roux, Hertwig, Herbst, Driesch and other active Continental experimental zoölogists have been published. But most of these books and papers limit their attention to experimental work with the egg and immature stages of animals—that is, to animal development, and Morgan's is really the first satisfactory authoritative account of experimental zoölogy in all its phases. This is at once an evidence of American interest and activity in this modern aspect of biological investigation and a reason for our self-congratulation.

What is experimental zoölogy? The first step in the development of a fertilized frog's egg is a splitting or cleavage quite thru the tiny mass of protoplasm and yolk (altho the halves do not separate, but remain within the egg membranes and apposed). Now this first cleavage occurs in nature regularly parallel to the pull of gravity. Is the direction of this cleavage perhaps determined by gravity? By compelling the egg, which has its yolk and germinal plasm definitely arranged with regard to each other, to lie so that the axis normally parallel to gravity is at right angles to it, and noting the direction of the first cleavage in eggs so placed, it may be determined whether this direction is caused by gravity or by some more intrinsic influence, such as the relative disposition of yolk and plasm. Does this first cleavage which divided the yolk and germ plasm into halves indicate the median plane of the future embryo, or, in other words, is each one of these halves of the egg predetermined to produce a right or left half of the developed frog? By killing or removing by delicate manipulation one or the other of these halves the answer to this question may be found out.

What is fertilization? Is a sperm cell actually necessary to initiate and maintain the development of an egg cell? Loeb's experimentally obtained results in initiating by physico-chemical stimuli the development of unfertilized egg cells of sea-urchins and other animals help toward getting answers to such questions.

And so on. Experiment in biology is the introduction into the zoölogical and botanical laboratories of the familiar

* EXPERIMENTAL ZOÖLOGY. *By T. H. Morgan.* 454 pp. 25 Figs. New York: The Macmillan Company. $2.75.

processes of the physical and chemical laboratories, whereby conditions are known, controlled, measured and modified, and the corresponding results or effects are accurately noted. Such methods have already been applied to determine the influence of external conditions in causing changes in the structure of animals, the effects of hybridization, the factors that influence growth and development, the factors that determine sex and secondary sexual characters, etc.

Professor Morgan's book is the best, indeed the only up-to-the-moment abstract of the results and the various phases of this experimental investigation of the life and make-up of animals. It is not primarily a book for the general reader, but there is no other for him on the same subject. And he can better afford not to understand a few of Professor Morgan's references and yet be able to rely on what he does understand as being true, than to look for a more popular and less reliable account.

Stories of Russia and Revenge

The Long Road[1] is a charming story, charmingly told. Its author is not himself a Russian. We did not, therefore, expect to find in it the wealth of detail, the nice shading, the searching analysis of national character, the profound implications with which the novels of Russian life by the great Russian masters have made us familiar. The Siberian landscape and its living forms are lovingly depicted, the essentially simple characters are drawn in strong lines, the passions evolved are the elemental ones common to all humanity—love of wife and child, hatred of the oppressor, the longing for revenge. And the conditions under which the story develops are so general, so fundamental to Russian life, that the events narrated might have taken place at any time since the establishment of the Russian governmental system, prior to the construction of the trans-Siberian Railroad and the rise of a spirit of revolt in the Russian people. These conditions are, on the one hand, the arbitrary, unrestrained despotism, which descends in a straight line from the Despot of All the Russias to the meanest official stationed on the remotest and most inhospitable confines of the empire; and, on the other hand, the seemingly endless patience and innate submissiveness of the Russian people. Its pictures of an actual primitive life are much more true than those of hypothetically reconstructed pre-Adamites ever can be.

In the *Ferry of Fate*[2] we have the story of a young Jew in Russia struggling to raise himself from abject poverty thru an academic education and a professional career. His hopes are about to be dashed by official arbitrariness when he is saved from the brink of ruin by the arbitrariness of the official's wife. Her favor establishes him in an honorable position, to obtain which he had to embrace the official religion. Baruch is a guest in the house of the Governor of Ditomar when he learns that the sudden death of his parents was caused by the Governor. He resolves to avenge himself thru the Governor's daughter. But he is incapable of hiding his secret hostility from his intended victim, and also falls in love with her and gives her up without a struggle. The other Jewish characters, whose doings affect the fate of Baruch, are in keeping with the character of the hero. They are noble and vile in turn and incapable of forming any resolution except on the spur of the moment — only to regret what they have done as soon as they have done it. It is quite possible that such characters do exist among the Russian Jews. The horribly perverted conditions under which they are forced to exist, robbed of elbow room for a fair, honest fight with their fellowmen and with nature, undoubtedly mangle their characters, make them vacillating of purpose and subject to momentary impulses, which are regretted as soon as they are converted into deeds. Such characters, however, can become interesting only in the hands of a subtle analyst, whose love of mankind, even in its degradation, is as great as his perception of its wonderful possibilities. The *Ferry of Fate* shows the hand of the promising apprentice.

Muther's Histories of Painting

It is not often that one is permitted to write with unqualified enthusiasm of a history of art that is encyclopedic in its range, for the reason that few men who have written upon the subject combine Professor Muther's profound erudition, sureness of judgment, excellence of taste and grace and fluency of expression. His *History of Modern Painting*[1] covers the entire field of European pictorial art from the time of Hogarth to within ten years of the present day. He shows admirable skill in following the sequence of influences which, proceeding from one nation, from one school to another, give rise to the organic evolution of European art. But he is far too modern, far too enlightened to fall into the great sin of the earlier evolutionary historians. In Taine, for example, such great overemphasis is placed upon climate, soil, etc., that the reader comes presently to doubt whether art is the work of human genius at all, whether it is not, indeed, an inevitable fruit of the ground, like pumpkins, squash or beans. Professor Muther has a sufficiently keen sense of the psychology of each period, of the peculiar intellectual and religious tendencies that give to each age its characteristic and dominant style. But it is always of painters rather than of painting in the abstract that he writes; he understands with Hugo that what nature is to God that art is to man. It is hardly extravagant praise to say that in its happy reconciliation of the force of "tendencies" with the force of individual genius his work is comparable to that of the English historian Green.

The enlightened and liberal spirit which enables Professor Muther to treat paintings as "human documents," without robbing his history of the vital interest which is inseparable from the appreciation of the life and genius of great men, will more particularly commend his volumes to the general reader who is looking for a satisfactory reference handbook on modern painting. To the special student of painting, however, they will appeal, because of the author's rare ability to criticise works of art from the painter's point of view. He is one of the exceptional critics who understands that the business of the painter is with color, and not with philosophy, poetry or story. He cites with approval Whistler's doctrine that the only true painter is the man "who draws the motives for his harmonies from the accord of colored masses," and thus introduces into the popular discussion of art a much-needed counterblast to the dogmas of Ruskin, whose writings, while they have hung countless photographs of paintings by Fra Angelico and Botticelli upon the walls of college settlements, have prepared the public mind to go into maudlin raptures over the banalities of Greuze and Breton and Bouguereau.

The *History of Modern Painting* is beautifully printed, illustrated with 50 full-page color plates as well as numerous half-tones, and furnished both with a complete index and an unusually full bibliography.

The same psychological method which he applies to the study of modern painting Professor Muther brings to bear in the two volumes of his *History of Painting from the Fourth to the Early Nineteenth Century.*[2] This work shows the same subtlety of sympathetic insight as the more elaborate study already reviewed, altho, owing to its great condensation, it is somewhat better adapted to the classroom than to the library. And yet it is only by comparison with the larger work that this two-volume *History of Painting* elicits criticism. There is hardly another work of similar scope that is at once so compact with information and so pleasant to read.

Fräulein Schmidt and Mr. Anstruther. By the author of "Elizabeth and Her German Garden." New York: Charles Scribner's Sons. $1.50.

Fräulein Schmidt is a distinct acquisition. Her letters to Mr. Anstruther express a new individuality, the Bachelor Maid at her best. We all know her, but we do not meet exactly her like in books. She has the rare gift of friendship for men, and we would like to shake the un-

[1] The History of Modern Painting. *By Richard Muther,* Professor of Art History at the University of Breslau. Revised Edition. 4 vols. New York: E. P. Dutton & Co. $25.00.

[2] The History of Painting, from the Fourth to the Early Nineteenth Century. *By Richard Muther.* 2 vols. New York: G. P. Putnam's Sons. $5.00.

seen Mr. Anstruther for forfeiting such a precious possession as a real friendship. To be sure, he does not have a fair chance; it is one of those one-sided, telephonic correspondences, in which we have to guess at his part of the dialog. He may have been nicer than we think. It is manifestly unfair to tell only one side of a dual story, but it is the device used by so great an artist as Mr. George Moore in "The Lake," and it has an effect of coherence and of character-drawing which a fuller report might lack. Then, too, it is doubtful whether lovers ever really "answer" each other's letters! They must speak to the beloved at brief intervals, and they rush into vehement speech without waiting for a cue. And so there are endless misunderstandings, and heart-aches, and woes that might have been avoided, if both were reasonable and logical; which Heaven forbid!. Let us have a little unreason, that the world may not grow old and wise too soon! Rose-Marie Schmidt is a fascinating correspondent, as we might expect, since she is "Elizabeth" herself, in the guise of a poor German *Fräulein*, with no riches except a well-furnished brain, and an unquenchable spirit. It is the latter which attracts us most, and the wholesome heroism with which she remakes her broken life until "it is very rich within," until her friends call her "Fräulein Hebe," proves her robust of nature; she has a sense of humor, is the best of company, and a tonic for the morbid.

Partners of Providence. By Charles D. Stewart. New York: The Century Company. $1.50.

Mr. Stewart has followed "The Fugitive Blacksmith," of two years ago, with a new story of life on the Mississippi, and has given a new boy to literature; for Sam Daly is not a Tom Sawyer by any means; he has a personality all his own, and a most attractive one. The lonely little fellow of fourteen, put ashore from the packet at New Orleans, with 60 cents between himself and starvation, and it did not stay between very long, as Sam says, "I ought to 'a been more careful with that 60 cents," is a brave but very hungry boy before that chapter of his history ends. He is a pretty hardened reader who can read the New Orleans episode without a lump in his throat. The boy is so little and so brave, with no companion, except Rags, his dog, and a pet alligator, bought with thirty of his precious sixty cents, and named, "George . . . the best I could do, . . . as I didn't know no alligator names. It's mighty hard to name an alligator, because they don't take after anything." Sam journeys for a short time on a "show-boat, bossed by a professor, not a school professor, but a professional professor," in company with a fat lady and "freaks from a busted show"; he finds a friend; loses him; searches for him; and when the warm-hearted policeman asks the forlorn mite "An' have ye no frinds at all?" says "I was maybe going to have one this winter"; and we become as eager as he to find Clancy. Other stories than his own find a place in his narrative, and bits of boy-philosophy crop out in unexpected places.

> "When you make a law for yourself you don't want to repeal it; there ain't no use in you making up sensible laws if you don't live up to them." "Well, I got into an argument about it; but she stuck to it she was right anyways. Maybe she was, too; only you couldn't prove it."

The Religion of All Good Men, and Other Studies in Christian Ethics. By H. W. Garrod. New York: McClure, Phillips & Co. $1.20.

Mr. Garrod is an Oxford tutor, a very facile and even brilliant writer, manifestly an accomplished scholar and as evidently a man of devout moral sincerity, who confesses himself unabashed a Goth in religion, a devotee of Gothic ideals rather than either Christian or Greek. Chivalry and honor are the Gothic virtues which he declares to be the real inspiration of modern good men, and these he does not find in Christianity, which he interprets as the religion of resignation. He would seem to agree with Tolstoy in his understanding of the Gospels, but instead of essaying to put such an effete faith into practice he abjures it violently and looks for his ideals of life elsewhere. This sounds very terrible, and Mr. Garrod would seem to be conscious that he is somewhat shocking and not to be altogether displeased there-

at. The total impression, however, from his entertaining essays is that he is not so bad as he calls himself. His religion is a very decent type of Tom Brown muscular Christianity, and that he will not name it Christian is due to his critical verdict that the religion of the New Testament was something very different and very much less worthy. As a critic, however, Mr. Garrod is not infallible, and it is by no means certain that the resultant doctrine, after full and fair consideration of the total teaching of the Gospels by the severest critical standards, is quite the weak and other-worldly piety which it appears to be on the pages of this essay. The chapter on "Christ the Forerunner," whose thesis is that Jesus desired to foretell a kingdom, not to usher one in, is the least satisfactory in the volume, if we except the inordinately violent philippic against certain hymns which, in America at least, are now little used. Yet the critical judgment implied in the title "Christ the Forerunner" is responsible for Mr. Garrod's position in regard to Christianity, and if it can be shown that this judgment is mistaken, which is likely to be the case, the strictures on Christian morals will lose their force. The spectacle of a sincere man disavowing Christianity because it is not good enough is sufficiently novel to pique one's interest, and whoso is drawn by curiosity to Mr. Garrod's pages will find his attention kept alert.

Jeanne D'Arc. By Percy MacKaye. New York: The Macmillan Co. $1.25.

Why is it that all these "literary" plays are so unsatisfactory, even in the reading, Mr. Phillips's as well as Mr. Mackaye's? Oddly enough, it seems comparatively easy to make them carry on the stage, before an indulgent public, by clever acting and attractive scenery. But in the study or closet, with an eye to which it may be assumed they were written, their weakness is unmistakable. Nor would the fact be so extraordinary if they were not in the main so good. There are passages that quite thrill you in the first act of *Jeanne D'Arc.* But at the same time there is a kind of inconsequence about the piece as a whole which destroys, at least to some extent, the effect. Not even Corneille and Racine are unsatisfactory reading, foreign as they are, tho they probably wrote with less thought of the printer. There is a gratifying consistency about them; they may be dull or heavy to the English reader, but they are not disappointing. The fact is that the kind of interest demanded of a poem that pretends to the form of drama, even if it is only a reading drama, is dramatic. And the interest of *Jeanne D'Arc,* as of so many other of these better current plays, whether staged or not, is not purely dramatic. For the peculiar characteristic which has come to distinguish these plays there is no name that exactly suits, tho perhaps ethical comes nearer than another. At least such is the name by which Aristotle would call it. That is to say, the interest, as, for example, in the case of *Jeanne D'Arc,* lies wholly in the hero's or heroine's character, the exhibition or revelation of which constitutes its sole coherence and unity. In other words, the play becomes the representation of a quality rather than of a situation or transaction. And this circumstance gives it a kaleidoscopic effect; it is a series of apparitions—not a consequence, but a phase. While in the lack of fundamental dramatic integrity the author is forced to rely exclusively upon two substitutes — picturesqueness and poetry, the one for the eye, the other for the ear; and the mind, which ought to find its account in the significance of the whole design, is only disconcerted and bewildered. Read the first act of *Jeanne;* see how pretty and pictorial it is—and whenever the picture leaves off, there is always the poetry; and then compare it with the exposition of a masterpiece like "Tartuffe" and observe that it proposes scarcely one genuine dramatic postulate.

Five Fair Sisters. By H. Noel Williams. New York: G. P. Putnam's Sons. $3.50.

The five fair ladies in Mr. Williams's plot are the nieces of Cardinal Mazarin, whom that wily and supple diplomat introduced to high life in France and married off successfully, according to the standard of the time. The story opens with the position of the Cardinal at the French Court, discusses his relations to

Anne of Austria, and then relates the loves and intrigues of Mazarin's five nieces. Naturally enough, Marie Mancini occupies the center of the stage, owing to her romantic and sorrowful courtship with Louis XIV himself. The other four sisters are by no means neglected and the whole is worked together in a well wrought story. Mr. Williams is more careful with his facts than most writers of similar books, and there is a certain balance proportion which gives it additional charm.

Researches in Experimental Phonetics. The Study of Speech Curves. By E. W. Scripture. Washington: The Carnegie Institution.

That an investigation of the nature of verse could not be carried out without the use of the mechanical and mathematical devices elaborated in this book will occasion some surprise. But the very fact that Dr. Scripture felt compelled to forego the realms of versification until he had made more sure of the elements of speech itself marks the advance to a genuine scientific procedure in phonetics. How the vocal mechanism works in the production of speech, the physical nature of the sound waves, and the impression received by the ear—these three branches of the science are reconciled on the basis of an adequate analysis of the sounds themselves as recorded by the phonograph and gramophone. No one heretofore has succeeded in doing this and the whole science, and a large portion of philological research as well, has been rendered disreputable by the failure, particularly when the absence of any definite standard has led to the uncritical acceptance of what the ear seems to hear in the case of any particular speech sound. The present work tends to the other extreme, disregarding the verdict of the ear in favor of a mechanical record of which the accuracy is not as yet well enough established. The particular conclusions reached regarding the glottal action and the relative importance of frictional factors in the tones upon the resonating cavities is of technical interest as in the opinion, supported by elaborate experiments, that the cavity tones are not partials of the fundamental glottal tone and that our theory of hearing must be modified because of the consequent impossibility of applying simple harmonic analysis to such inharmonic sounds. But significant as those results are for the science they are of minor consequence beside the achievement of a method of solution for such questions. The book contains full descriptions of the machines used in enlarging the talking machine records, directions for the interpretation of by inspection of the curves, and for elaborate mathematical analysis of them. Even a set of schedules is provided for harmonic analysis up to seventy-two ordinates. The procedure is necessarily arduous as yet, but abundant examples are given to show that it is feasible and the way is made plain to standardize all the vowel sounds and define their essential differences, to trace the modes of pronunciation in different localities and among different peoples, and to exhibit the actual effects of emotion in vocalization.

The English Patents of Monopoly. By William Hyde Price. Boston: Houghton, Mifflin & Co. Pp. xi, 261. $1.50.

This book is the first number of the Harvard Economic Studies. It is uniform with the Harvard Historical Studies and is published from the income from the David A. Wells Fund, having been awarded the David A. Wells Prize for the year 1905-06. The monograph is a credit to American scholarship, inasmuch as it treats of a subject in English economic history hitherto much neglected by English economists. The two leading writers of English industrial history of the seventeenth and eighteenth centuries, Mr. Charles Unwin and Mrs. Lilian Tomm Knowles, have directed their studies mainly to the incorporated external trading monopolies of the period, of which the East India Company is the leading example. The patents of monopoly, however, antedate the incorporation of the great trading companies, a record of such grant having been made as early as 1562. The patents were first granted to individuals, frequently as a reward for the introduction of some new art or manufacturing process in the kingdom. As the scale of industrial undertakings in Great Britain was enlarged, incorporated companies

began to receive monopolistic privileges. In fact, the beginning of corporate enterprise in England may be traced to the patents of monopoly. Nearly every important monopoly in the seventeenth century was held by a joint stock company. The effect of the "projecting spirit," which was encouraged by the formation of monopolistic corporations, was not always advantageous to the community. Consequently, there arose a popular outcry against the patents of monopoly. In the legal struggle that ensued it was held that monopolies were contrary to the common law. A subsequent struggle ended in a statutory confirmation of this principle, and when Charles I, ignored both courts and Parliament, a revolution finally succeeded in firmly establishing the principle.

The Development of Religion in Japan. By George William Knox. (American Lectures on the History of Religions, Sixth Series, 1905-1906.) New York: G. P. Putnam's Sons. $1.50.

Ideally equipped for his work, the professor of the History and Philosophy of Religion in Union Theological Seminary treats less of religions than of religion in Japan, and how it grew. In Nippon only the cool philosophers and hot partisans discern between Shinto, Buddhism and Confucianism. To the average native they have long ago amalgamated, furnishing in each case patriotism and reverence to the past and the dead, hope for the future, and rules of conduct for the present. Dr. Knox, long on the field, has studied, with keen sympathy, the man as well as the books. He knows that few think. The mass feel and follow. He handles modern theorists, who account in this way or that for the origin of religion, with consummate ease. Development is greater than evolution, for Japanese religion was propagated even more than it was originated. The forces were mainly from without, and progress was far from continuous. The Norito, or late rituals of Shinto, are official expressions on the State dogma. There was no such thing, in mind or reality, as a Japanese nation until toward the twelfth century. Even the Kojiki, "the Bible of the Japanese" (712 A. D.), has for its story "the marriage of the worship of Nature to that of the worship of the Imperial House." There is very little left of Herbert Spencer's theories as to the origin of religion in Knox, as in Aston. Shinto is the worship of Nature, not of ghosts or of men. The Aryan religion of Buddhism, "the worship of the Absolute," reached Japan when already old and transformed. The noble eightfold paths of ethics had been forgotten in a maze of priests' rules, and the Buddha of history lost in the dreams of scholasticism. With masterly hand the evolutions of Buddhist Gnosticism in Japan are traced. It failed to satisfy the intellect of the thoughtful, tho still ministering to the lowly. Of Confucianism, as polity and ethics and as a world-system, Dr. Knox writes with consummate analytical power and due appreciation, for he is at once a correct historian and a philosopher of clear vision and profound sympathy. He knows, too, the glorified Bushido and the neo-Buddhism of the young writers, who hope for the regeneration of Nippon thru a purified worship of the Absolute. Less interesting as a human story than "The Religions of Japan," by another American author, this work is far superior as the philosophic presentation of a most fascinating chapter in the grand story of the human mind.

The Curse of Rome. A frank confession of a Catholic priest and a complete exposé of the immoral tyranny of the Church of Rome. By Very Rev. Canon Joseph F. MacGrail, former Chaplain United States Navy. 12mo, pp. 96. New York: J. F. MacGrail, 242 West Forty-first street.

A very strange character is confessed in this little book. The author was chaplain in the Navy and was court-martialed in the Philippines for drunkenness and licentiousness. He admits that the charges were true and the sentence just. He feels humiliated, but does not pretend to have repented and reformed. He tells how honestly he entered the priesthood, how soon he fell into unbelief and sin, what a hypocritical life he then led and continued, while acting as chaplain. He puts the blame of his fall on the Church, which put him in fetters which were too strong for him. He believes confession to be a help to character and faith. He

returned to this country after his court-martial, and altho his record was known to his ecclesiastical superiors, he was not suspended from his priestly functions, but was sent to a temporary service at Oxford, Mass., with clean papers, and then left the Church of his own volition. He owns that he was a "coward" and a "hypocrite" while in the Church, and that the last year in New York he has been more than once arrested for drunkenness. This is not an agreeable confession. If he has any religious sympathies they are still with the Catholic Church. He has no bitterness against other priests, no scandals other than his own to intimate, and he seems to plume himself that now he is at last an honest man. He appears to be selling the book and lecturing for a living.

Chicago Traction—A History, Legislative and Political. By Samuel Wilber Norton. Chicago: Published by the author. $1.00.

The controversy between Chicago and the traction interests which control the transportation facilities of that city has been a long-continuing one which has aroused considerable national interest, and the outcome of which has been awaited as an event of great significance in its probable bearing on other municipalities. The traction question was the pre-eminent issue in the recent election in Chicago; and, altho the defeat of Mayor Dunne was heralded as the death blow to municipal ownership in Chicago, it is certain that the question will come up again, not under the sponsorship of a mild and ineffective reform party, such as was Dunne's, but as one of the issues of a movement which will proceed to abolish the anomaly of farming out a great city's streets to a few individuals. Altho this work was written with a special view to the recent election, it is of permanent historical and economic value. It traces the origin of the granting of the transportation franchises and uncovers the scandalous bribery and other political debauchery which accompanied the grants of franchise rights and leases by legislature and common council. It shows how private interests have used the streets and transportation system of Chicago, not with a view of accommodating the public, but as a gigantic plan of exploitation from which vast fortunes have been extracted. From the revenues thus obtained the traction interests have been able to control elections and representative bodies. Their grip on Chicago is stronger today than it ever was. The work is soberly, dispassionately written, largely in chronological order, and is a good, in fact, a valuable, contribution to current matter pertaining to municipalities.

European Enamels. By Henry H. Cunynghame, C.B. The Connoisseur's Library. New York: G. P. Putnam's Sons. $6.75.

Glass. By Edward Dillon, M.A. The Connoisseur's Library. New York: G. P. Putnam's Sons. 1907. $6.75.

Not connoisseurs alone, but amateurs who are struggling to master the mysteries of enameling, will be guided and profited by Mr. Cunynghame's beautiful and instructive volume, fair in proportions, noble in print and generous in full-page illustrative plates, several of which are richly colored. The author has a practical knowledge of the technique of this art, and has dealt more particularly with methods of work in an earlier volume. This book is the first attempt to give in English a systematic history of enamels. The author acknowledges his indebtedness to European, especially French, students who have written much upon early enamels. His familiarity with various processes of the art has enabled him to give very clear descriptions of methods of work. Beginning with those ancient times when the enameler's art was exercised upon articles of jewelry, he shows it under the Byzantine influence representing religious subjects, and during the Middle Ages still further employed for purposes of religious instruction, when large enamels of striking color were bestowed upon churches and cathedrals. Then followed painted enamels and miniatures, until the art was degraded to snuff-boxes and to jewelry once more. Just now a new interest has been awakened in enamels, not only in England and on the Continent, but in America, and amateurs are testing their skill in the art. The Connoisseur's Library, to which these two books belong, is under the general editorship of Mr. Cyril

Davenport. Mr. Dillon, its author, claims that it is in the British Museum and in the South Kensington Collection that the history of glass should be studied. More than two-thirds of the illustrations used represent objects in British collections. About a hundred works by seventy-nine different writers are named in the useful Selected Bibliography. The first half a dozen chapters are devoted to primitive and early glass down to the Middle Ages. In addition to the evidence of Babylonian glass given by Mr. Dillon might be mentioned that found by Dr. Peters at Nippur of the thirteenth century B. C., colored blue with cobalt and green with copper, not blown. There are also Assyrian cylinders of glass and an Assyrian cone of the beautiful emerald glass. Other chapters tell of medieval treatises on glass, of Saracenic enameled glass, of Venetian glass, whether enameled or otherwise, and that of the Renaissance, French, Spanish and Netherlandish. Two chapters are devoted to German, two to English and one to Dutch glass; Persia, India and China together supply material for another chapter; while the final pages are devoted to contemporary glass, which commands but little praise except in the case of M. Gallé's new methods as practiced in Nancy and the *pate de verre* used by the French sculptor, M. Henri Cros. Tho the book deals chiefly with "hollow ware," some interesting and valuable pages are devoted to stained glass and to Venetian beads, and the subject of drinking glasses of the eighteenth century is discussed at length in the English section. The book is technical enough to be useful to the student, and full enough of history, romantic suggestion and beautiful illustrations to hold the attention of the untrained person with artistic impulses who is beginning to take an interest in glass.

Studies in Biography. By Sir Spencer Walpole. New York: E. P. Dutton & Co. Pp. 478. $4.00.

Biographical essays, especially essays on contemporaries in English political life or on men recently dead, if they are to be worth reprinting after a lapse of years, must possess distinct literary value. As history, they are superseded almost as soon as published, for new light is thrown continually on the outstanding figures of last century by the publication of letters, diaries and papers, not only of the individuals themselves, but of their colleagues and opponents in public life. Sir Spencer Walpole's volume includes nine essays, all of which have already appeared, seven of them in the *Edinburgh Review*. To say that Sir Spencer Walpole's literary work can hardly be expected to have the permanent value of the essays of Macaulay is no depreciation of its merit. The essays in the present volume are all readable, and have to a high degree the human interest which differentiates biography from general history. Several of them are of the nature of reviews of lives or memoirs, which, at the time they were written, had recently appeared—reviews that are enriched with personal reminiscences and much incidental knowledge. Of the eight statesmen who are subjects of these essays, Peel, Cobden, Disraeli, Gibbon and Dufferin are Englishmen; the others are the two most outstanding makers of history of Continental Europe during the middle decades of the nineteenth century—Bismarck and Napoleon III.

Manners and Social Usages. Revised and corrected. New York: Harper & Bros. $1.25.

No one need ever fear the taking of an awkward step in company if only he will master the excellent and comprehensive precepts in this book. There are 368 pages of it; it is authoritative, much of it having been prepared by the late Mrs. M. E. W. Sherwood, and it is brought up to date. It covers about everything that can be imagined as needful to the man or woman trying to break into society or to remain there. Not many persons, of course, can do or avoid doing, all of the many things about which instruction is here given. This is a busy world, especially for men. To the great majority, therefore, so elaborate a schedule of social conduct must remain a counsel of perfection not to be realized in practice. But it is well to have it all set down somewhere, so that the curious, when necessity prompts them, may be able to find the particular requirements for a particular occasion. We know of

no other book that so amply meets the need.

Literary Notes

....A good book of advice to ministers is Principal Pollok's *Studies in Practical Theology* (Edinburgh: William Blackwood & Sons). Words of wisdom on all topics connected with the life and duties of a clergyman are here clearly and courteously expressed. The book does not contain overmuch that is new, but it calls attention ot a good deal that is likely to be forgotten.

....The thrilling story of *The Age of the Maccabees,* so important to a knowledge of Hebrew history, is well told by the Rev. H. F. Henderson in a recent issue of the Temple Series of Bible Handbooks published by the Lippincotts. The popular impression that the ancient Jews were all long-bearded psalm-singers would be quite thoroly dissipated by an hour's attention to this excellent manual.

....The output of sermons in Germany is no smaller than in this country, yet very cordial welcome is accorded to a translation of fifteen discourses of Phillips Brooks entitled *Ein Ruf in die Höhe* (Berlin: M. Warneck). The Germans seem to recognize at once the intellectual and spiritual qualities which made Brooks so well beloved in England and America. The book has an introduction by Professor Peabody, whose name has come to carry no little weight in the land of the Kaiser.

....Visitors to the Jamestown Exposition should know something of the history of the settlement that it celebrates in order to get the benefit of their excursions to numerous historic sites in that vicinity. Hale's *True Stories of Jamestown and Its Environs* (Publishing House of the M. E. Church, South, Nashville, Tenn. $1.00) supplies the information most needed for this purpose, with many curious quotations from the original narratives. The romantic tourist will be disappointed, however, in not finding the story of Pocahontas's rescue of Smith.

....Romeyn Beck Hough, B.A., the author of "American Woods," is now publishing a *Handbook of the Trees of the Northern States and Canada, East of the Rocky Mountains.* The book is photo-descriptive. It is calculated to appeal to the amateur observer of trees, the lumberman and to the technical botanist. A tremendous amount of hard field work has been done in connection with this book, and surprisingly good photographs have been secured and used, so that the identification of trees is made exceedingly easy as well as certain. The descriptive text is also good. Romeyn B. Hough, Lowville, N. Y., ($8 and $10 according to binding).

....The Rev. Samuel Gardiner Ayres, librarian of Drew Theological Seminary, has taken the pains to prepare a bibliography of over 5,000 volumes on the life of Christ or topics connected with the doctrine of Christ Works in other languages than English are not included, save the few that have been translated, and this fact has prevented the mention of many of the most important treatises of all shades of opinion. A large number of the works listed have now merely an antiquarian interest. The tone of Mr. Ayres's annotations may be discerned from his comment on the work of Prof. N. Schmidt, "Rationalistic, but Honest." The bibliography is published by A. C. Armstrong & Son.

Pebbles

ELLA—Marry you? Why, you couldn't dress me.

Edgar—I wasn't asking for a position as lady's maid.—*Pick Me Up.*

CHARLOTTE—The second time I saw him I was engaged to him.

Kit—What caused the delay?—*Evening Telegram.*

JUST AS HE SAID HE WOULD.

"BE *mine*!" he cried in a voice surcharged with anguish. "If you refuse me, I shall die!"

But the heartless girl refused him. That was sixty years ago. Yesterday he died.—*Tit-Bits.*

FIRE AS A SOCIETY EVENT.

HOW A FEMALE REPORTER DESCRIBED THE BLAZE FOR HER PAPER.

THE regular reporter was taking a vacation, according to the Neodesha, Kan., *Sun,* and the editor was busy in the office, so when it was learned that on the previous evening there had been a fire in a remote part of the city the young lady who writes the society news was sent to bring in a report of it for the paper. She came into the office an hour later with the following very interesting account:

"Quite a number of people in this part of the city attended a fire last night at the residence of Mr. and Mrs. Blank in Thirteenth street. Some went in carriages and buggies, but a majority walked. The alarm was sounded about 9.30, and many who attended the fire had just returned from church, consequently they were already dressed for the occasion.

"Mr. Blank was not at home, being out of the city on business; hence the affair will be quite a surprise to him when he returns. Mrs. Blank wore a light percale kimono and had her hair done up in kid curlers.

"The firemen responded readily and worked heroically to subdue the seething flames. Most of them were young and fairly good looking. They were dressed in oilcloth suits cut short, with trousers to match. Their hat rims were narrow in front and broad behind and sagged down in the rear. The chief's hat was ornamented with an octagonal brass spike, which stuck up above his head like a horn, giving him the appearance of a unicorn.

"When the flames broke out thru the second story and cast a lurid hue over the surrounding buildings the view was one never to be forgotten. At a late hour the sightseers went home, and all felt that they had past an evening full of interest and excitement."

The Constitutional Power of the People

We have no means of knowing how many generations of our ancestors, with tom-toms and vociferations, worshiped fetishes of wood and stone, and it doesn't much matter. We know that three or four generations of our American ancestors have rendered worship "for the most part—but not altogether—of the silent sort" to political fetishes, created in 1788, or thereabouts, and that we ourselves are diligently keeping up the habit.

"Reverence for the Constitution" is a fine-sounding phrase, until one happens to ask himself just what meaning, if any, it has. Why should we reverence our own handiwork, or cerebral output? If we should adopt a constitutional amendment giving Congress power to enact the income tax that the Supreme Court set aside, ought we then to reverence it? Or, do we reverence the Constitution because it was put together by the clever log-rolling of a lot of very nice gentlemen in knee breeches a hundred and nineteen years ago? "The wisdom of the Ancients" is commonly taken for granted, but this is fetish worship, too. The ancients were not always so "long" on wisdom as we imagine, and their stock of information was meager. We do not think it necessary to reverence their pikes and chariots, their thumb-screws or ducking-stools, their imprisonment of debtors, or their chattel slavery. As for our less remote forebears, their wood-burning locomotives and paddle-wheel steamboats gratified them immensely; but electric motors and turbines answer our purposes better.

Constitutions, like other mechanisms, are usually better if up-to-date. Antiquated patterns are all right for museums, but they are unsatisfactory auxiliaries in the struggle for existence. The American Federal Constitution is an eminently dignified document, and many of its provisions are still good working rules, but there is no denying that by comparison with the constitutions that modern life calls for and that other great republics, like France and Switzerland, have adopted, it is a clumsy device, which wastes in unnecessary friction an enormous part of the constitutional power of the people.

We are moved to make these remarks by the recent very able utterances of such men as Senator Knox and Mr. Justice Brewer, who have been reminding the public that there are strict limits to the power of Congress to regulate industry under the Interstate Commerce clause, to readjust taxation under the revenue clauses, and to deal with such matters as employers' liability and the factory labor of children. These distinguished constitutional lawyers admit that the constitutional power of the people is unlimited, since the powers of Congress and of State governments are enumerated, and unenumerated powers are reserved to the people; but, they remind us, the people can exercise their reserved power only thru constitutional amendment.

This is the plain truth, and it is helpful to have it plainly spoken. To state it, however, is in effect to say that the Federal Constitution is exceedingly clumsy and defective in its most vitally important provision. Practically — so great are the difficulties of amendment— the people are prevented from exercising fully and freely their sovereign political power.

It does not meet this criticism to say that the people would use their power recklessly if obstacles were removed. For this is to say that the people are unfit for republican government. Either popular sovereignty should give way to

personal or to class sovereignty, or it should be a reality.

Practically we are in very much the same position under our Constitution that the English people are under their House of Lords. They can neither make it do what they want it to do nor get rid of it. The vote of four hundred and thirty-two against one hundred and forty-seven in the House of Commons supporting Campbell-Bannerman's resolution calling for such a restriction of the power of the House of Lords, "that within the limits of a single Parliament the final decisions of the Commons shall prevail," really avails nothing. The Lords are not bound by it, and they will not vote their own political annihilation.

In America and in England the real failures of popular government are traceable directly to sheer political fetishism, to the assumption that because institutions are venerable and cherished they are therefore wise and workable. France may not be the model republic of the world quite yet, but France has the only method of constitutional amendment, short of the Swiss method of referendum, that is really consistent with the assumption that the people are sovereign. The Chamber of Deputies and the Senate by concurrent resolution may at any time come together as a national assembly, and, as such, may to any extent revise the Constitution. This method secures ample deliberation and at the same time makes necessary changes comparatively easy of accomplishment. It gives actual expression to the reserved powers of the people. It is as superior to the American method as an American railroad is superior to a *chemin de fer*.

Even better, however, is the out-and-out democratic method of amendment by referendum, which most of the American commonwealths have adopted. It is this method which is receiving constantly increasing attention in English political discussion, and which the most influential part of the English press is now declaring to be the one possible way to bring the House of Lords to terms. This method, adopted in our Federal system, would make our whole political scheme of things self-consistent, and in practical working republican.

A New Syllabus

Pius X follows the example of Pius IX and gathers up the new errors and tells the Church under his care what it may not believe. One would have thought that Pius IX in his *"Quanta Cura"* of December, 1864, in which he gathered a Syllabus of eighty popular errors, might have included about all that needed absolute prohibition, for they covered pantheism, absolute and moderate rationalism, indifferentism and latitudinarianism, "such pests as Socialism, Communism, secret societies, Bible societies, and clerico-liberal societies," the denial of temporal power, unsectarian public schools, the separation of Church and State, civil marriage, and freedom of worship. Pius X has, however, discovered sixty-five other errors that have within these forty-three years newly come up out of the Pit, and have found currency in the writings of professed Catholics, such as the Abbé Loisy, Houtin, Fogazzaro and a dozen other French, German, Italian and English scholars; and we fear even American Catholics are infected, for we have seen such hints in a certain semi-monthly Catholic journal of St. Louis, which hammers the heretics and the Catholic University at Washington at every opportunity.

The text of the new Syllabus of Errors is not yet received, but we are told that it is devoted chiefly to the Scriptures. Among the errors condemned are the following:

"Divine inspiration does not guarantee all and every part of the Holy Scriptures against error.

"The resurrection of the Saviour is not an historical fact, but is purely supernatural. It can neither be demonstrated nor is it demontrable.

"The Roman Catholic Church becomes the head of all churches, not by divine ordinances, but by purely political circumstances.

"The Church is the enemy of natural and theological sciences.

"The Christian doctrine was first Judaic, then Pauline, then Hellenic, then universal.

"The principal articles of the Apostles' Creed had not the same significance to the primitive Christians as they have to the Christians of the present time."

The hopes set upon the document are large, and in the Curia many are confident it will root out and banish forever the new views, altho, as is well known,

even the clergy are drinking them in more and more deeply. The old Syllabus is forgotten. No one ever hears a bishop at home or abroad refer to it. In fact, most Catholics know nothing about it. It will be the same with this one.

It is a curious fact that for some reason or other the Congregation of Studies, whose prefect is Cardinal Satolli, we believe, were not asked or consulted about it. And yet to this Congregation was committed the task of reforming the seminaries. Their friends are angry, and ugly comments are heard. Possibly these cardinals were ignored because, as every one knows, this Syllabus is directed in good part against liberal teaching in the seminaries themselves. So good an authority as the new "Catholic Encyclopedia," the writers of which are mostly professors in seminaries, gives the current views of the critics on the Bible as freely as the traditional, and in such a case the new is apt to seem to have the better reason.

We are in the beginning of the twentieth century, and Pius X does not know it. The world has moved; science has advanced; new sources of history are available; criticism claims its conclusions. It is useless, it is ridiculous, for a committee of priests in Rome to tell thousands of men as learned and intelligent as they what they shall believe. This work has been done, we gather, by the Congregation of the Holy Office, also called the Congregation of Roman and Universal Inquisition. It is presided over by the Pope himself. Its object is "to combat heresies and false doctrines and to restrain heretics from injuring the Church." As an Inquisition it has lost its physical power, but it still attempts to suppress men's reason. It is likely that the Catholic laymen's league of which the *Correspondenza Romana,* an unofficial organ of the Vatican, gave information the other day, is the last occasion for this condemnation. Its object is to advocate reforms in the Church, and it is said to have many adherents in Germany and Great Britain, and it has sent a petition to the Pope against the recent pronouncements of the Index, and asking that the Index be abolished. The Pope has lately approved a severe prohibition against the writers for the Italian review which represents their views. That Pius IX and his namesake, who now wears the tiara, are thoroly religious men, worthy of the name they have chosen, we do not doubt. That they are competent to decide on a question of scholarship or faith we do not believe. A member of the Pope's household says that he hesitated to take this serious step until in prayer he had a vision of the Blessed Virgin who extended her hands over him in benediction and encouragement; that in obedience to her he rose and signed the decree. That proves him pious but not wise. Possibly he misinterpreted the vision, and it was his hesitation which she meant to encourage.

No Congregation of the Inquisition, no Pope, no Council even, can block human thought. That must be free to study evidence and follow wherever truth seems to lead. Truth is regal, pontific, above all rule of Church or State; and reason and only reason is arbiter. The pity of such a restraint of reason as this attempts is this, that a multitude of scholarly, profoundly religious and conscientious men, who love their Church and wish to be loyal to it, are compelled to be silent, to suppress their belief, to submit outwardly, to satisfy themselves by ambiguous utterances, while waiting for the storm to blow over. It is an unhappy situation; but in their own hearts they know they cannot compel their reason to submit, if they can suppress their words.

The Extinction of Korea

THE scenes now being enacted in Seoul possess all the elements of a great drama, except the hero. There is pathos in the confidence of the Emperor that an appeal to the Powers assembled at The Hague would save his country from the fate to which they had long ago tacitly consented. There is tragedy in the deaths of the humble Korean patriots who offered a futile and belated resistance to Japanese aggression. Behind all the movements of the individuals there is essential dramatic element of fatality, the inevitableness of the catastrophe which is putting an end to its three thousand years of history. And, lastly, the play is enlivened by plenty of humorous dialog and farcical situations.

It is no wonder that Japan and Korea have been chosen as the scene of our comic operas. Could any but Orientals go thru diplomatic dialogs like those reported from Seoul without breaking down and laughing? The Emperor of Korea asks Marquis Ito if he ought to abdicate. The Marquis replies that that is purely a matter for imperial consideration, and that he cannot, as a representative of Japan, interfere with the internal affairs of Korea. The Minister of Justice subsequently explains to Marquis Ito that the Emperor has resigned, not on account of any outside pressure, but purely on his own initiative, as he had been contemplating doing it for the last ten years. The Marquis changed the subject. The Cabinet comes to Marquis Ito in the dead of night begging protection, for the ex-Emperor has ordered the Imperial Guard to kill them. The Marquis answers that the ex-Emperor had requested his aid in repressing disorder, and so he sends Japanese troops to confine the Imperial Guard to their barracks and cover them with artillery.

But this formal foolery has no significance or importance. Japan has pursued her policy of benevolent assimilation with more directness and swiftness than is usual. The process was so transparent that it could be watched in all its stages as easily as when a microbe is enveloped and digested by a phagocyte. Marquis Ito, as soon as he became Resident General at Seoul, assumed the position of a Mayor of the Palace to a *roi fainéant,* or, to use a nearer analogy, a Shogun to a Mikado. Month by month the toils were drawn closer about the ill-fated Emperor. Japanese guards were placed at the gates of the palace, and only those whom the solicitous Ito regarded as proper associates and advisers for His Imperial Majesty were allowed to enter. In the official report of the Residency General it is explained how this "singular operation" of the "purification of the court" was "resolutely carried out" just a year ago. The passage is worth reading from the light it throws on the situation as well as the quaint *naivété* of its wording:

"In years preceding Korea experienced a series of troubles within and worries from without, and the anxieties of the Emperor were incessant and painful. Taking advantage of this state of the Imperial mind, men and women of uncertain origin and questionable character, but all with stories to catch His Majesty's ears, had in a considerable number come to find their way into royal palace, until the latter had become a veritable rendezvous of adventurers and conspirators. Divining, fortune-telling, and spirit-incanting found favor there and knaves and villains plotted and intrigued within the very gates of the court, in co-operation with the native and foreign schemers without. By cheating and chicanery, they relieved the Imperial treasury of its funds and in their eagerness to fill their pockets never stopped to think of what dangerous seeds of disorder and rapine they were scattering broadcast over the benighted peninsula. In view of this perilous trend of affairs, the Resident-General waited on the Emperor and explained to His Majesty the imperativeness of henceforth enforcing strict scrutiny on those gaining access to the Imperial abode. In court circles there were no doubt some who at first felt alarmed at this radical turn of affairs; but the sterling sincerity of the Resident-General's solicitude becoming gradually better known, the force of resentment has since slackened, until no voice is now heard in open opposition."

It is unnecessary to say that the Cabinet Ministers were as carefully chosen as the palace favorites, but Marquis Ito deemed it necessary to take precautions against the disturbance of the imperiai mind by discordant and ill-considered opinions even of his official advisers, so he instituted a month ago what might be called ministerial dress rehearsals. The Cabinet met on one day at the Residency-General and the following at the Palace. His Majesty had the spirit to refuse to meet the Cabinet under this condition, coming to him, as he said, with tainted and second-hand opinions. It is probably this quarrel that precipitated the *coup d'êtat* and led to his deposition.

He will find few sympathizers and no champion. It was different twelve years ago when the Japanese had possession of his capital. Then there was a mighty nation eager to espouse his cause. When his women smuggled him out of the palace in the disguise of a female servant, he took refuge in the Russian legation where he lived for a year until the Japanese had retired to their own land baffled for a time of the fruits of their victorious war against China. He paid rent for his rooms at the legation by granting to his hosts the right to fell timber on the banks of the Yalu River, a

trifling concession it perhaps seemed to him but certain personages of importance in Russia appeared to want it badly.

This was one of the pivots of the world's history. Today there is no Russian legation in Seoul and the Japanese are logging on the Yalu.

We may regret that Korea has not been allowed to develop its own racial individuality and to work out its own destinies. But it never has been and its people seem to have lost the power of asserting themselves. If they had been inspired with the spirit of the Boers they could at least have made themselves of sufficient importance to be courted as allies instead of being treated with contempt by the armies that overran their country without resistance or impediment. The Land of the Morning Calm has always been a battlefield for other nations. Thruout its history China and Japan have simultaneously claimed and alternately exercised suzerainty over Korea. Seventeen hundred years ago a Japanese woman, the widow of a Mikado, appeared in Korea with a fleet and army. The King of that country submitted without a struggle. He tied his hands together and suffered Queen Jingu to hang her bow over the gate of his palace and to inscribe on it "The King of Korea is the dog of Japan." Ever since the Japanese have claimed the domination of Korea. Yi-Heui is only following in the footsteps of his ancestors in his present conduct. Marquis Ito, in a recent address to the Koreans, told them with remarkable frankness where their fault lay. He said, "you may talk all you please about the independence of Korea, but no country can be made independent by others if it cannot stand alone. One who wants independence must learn how to get it."

The Anti-Trust Law

PUBLIC criticism of the Sherman Anti-Trust law has been stimulated by the Government's application, in its complaint against the Tobacco Trust, for receivers who shall "wind up the business and affairs" of corporations capitalized at $230,000,000. Resort to a method of procedure so harmful to innocent stockholders and so depressing in its influence upon other industrial corporations was suggested by the virtual failure of certain notable attempts in the past to enforce this law.

It is a statute which could not be rigidly enforced without upsetting the business of the country and destroying a considerable part of it. As interpreted by the court of last resort, the Sherman act prohibits all contracts or agreements in restraint of trade, even those the effect of which is beneficial. Not only actual restraint of trade, but also the acquisition of power to restrain, is made unlawful. So far as railroads are concerned, the decisions of the courts under this law have caused the construction of such combinations as the makers of the statute desired to prevent. Joint traffic associations and compacts—without which, the Commission says, it is difficult to see how the railways could be operated with due regard to the interest of both shipper and carrier—having been made unlawful, capitalists and managers sought to exercise control of traffic by means of consolidation resting upon "community of interest." Thus the grouping of our railways in the hands of a small number of men was hastened by a statute aimed at monopoly.

Those industrial combinations which the authors of the law had primarily in mind have been only slightly affected by it. The number of such combinations has greatly increased since the statute was enacted. Very little has been accomplished in the public interest by the prosecution of any of them for combination and for monopolizing, or attempting to monopolize, the products of an industry. If the Government be successful its case in the approaching trial of its suit (under the Sherman act) against the Standard Oil Company, it is not probable that the power which those who control that corporation now exercise in the oil industry will be perceptibly diminished. It was not proposed in the complaint against this combination that receivers should be appointed "to sell off the factories" and refineries to bidders from "independent concerns." What the result of the suit against the Tobacco Trust will be we cannot say, but we are confident that a "winding up" of the

American Tobacco Company's affairs and a sale of its factories will not be ordered by the court.

The Sherman act should be amended. It should not prohibit contracts or agreements in restraint of trade when the restraint is reasonable and even beneficial. Railroads should be permitted to become parties to joint traffic agreements, but these agreements should be subject to inspection and approval by the Interstate Commerce Commission. With respect to great industrial combinations, what the Government needs for the protection of the people is not power to disintegrate, to tear apart, and to "wind up" the business of a vast consolidation, but power to prevent the consolidated interests from acting unjustly.

Everybody knows that there are evils connected with the operations of some of these organizations. Comparatively weak competitors are oppressed and even ruined by the unjust practices of the greedy and unscrupulous managers of great Trusts. Those who are familiar with Trust methods of silencing competition can testify that they are of an exasperating character. Generally, one result of the use of such methods is a tax upon the consuming public, designed to increase the combination's profits. All this is well understood.

In the face of repeated official exposure and of convictions in the courts during the last two years, the existence of these evils cannot be denied by honest and intelligent men. As exposure follows exposure, and one conviction follows another, the American people long more and more earnestly for relief. Sometimes, being angry and impatient, they seek it by new statutes that are both futile and childish, as they are doing this year in Texas.

They are determined, we think, to put an end to the evils if they can do it by their ballots and by the efforts of their representatives in the Legislatures and in Congress. It is feasible to suppress the evils by official regulation or supervision. President Roosevelt argues earnestly for such regulation and has procured the enactment of a law by which provision is made for it in the case of railroads. He would now have the powers granted by this law increased, in order that the supervision may surely be effective. Mr. Bryan, believing that Government ownership will be the ultimate solution of the railroad problem, sees, as he said last week, that regulation must be thoroly (and unsuccessfully) tried "before the masses will be ready to try a more radical remedy."

Is there to be a thoro testing of the national Government's power to regulate and supervise the conduct of interstate railways? That is for the people to decide. Prefering regulation, as they do, to public ownership, they should not complicate the situation and injure their own cause by supporting unwise and ill-considered rate reduction bills in State Legislatures. Regulations of interstate railway traffic, affecting rates or practices, should be the work of an honest and competent national commission. The power to regulate will not be fairly tested if every State Legislature is to take a hand, cutting rates arbitrarily and without that careful inquiry which the subject demands.

Government ownership of great industrial combinations as a remedy for unjust and evil practices is not proposed by more than a very small minority of the American people. Official regulation and publicity are remedies that can successfully be applied to compel justice in the conduct of these organizations, if the Constitution will permit. Legislation for such regulation should displace the objectionable provisions of the Sherman act. It will be extremely difficult to procure repeal or modification of that law, but earnest effort should be made to convince the public that modification of it is needed.

If Senator Knox is right, the methods heretofore proposed for regulation of great industrial corporations may find no warrant in the Constitution. This is a question which should be studied carefully by competent men who are not moved by partisan prejudice or committed to the advocacy of public ownership. If it shall be shown conclusively that under the present provisions of the Constitution the national Government is not authorized to regulate the affairs and conduct of these corporations in a reasonable way, the people will probably decide that the Constitution should be

amended. With respect to railroads, and possibly in the case of great industrial combinations, there will eventually be a contest at the polls between official regulation and public ownership if the effect of regulation shall not be satisfactory to a majority of our voters.

Appreciation of One's Town

An interesting story comes from a little Western city telling of a teacher in the public schools who, after thirty years of service, rested from her labors and left her life's savings to the school fund. For over a generation she had exerted her influence in uplifting the boys and girls of the community, all the time practicing small economies that she might increase the bounty that her heart prompted and which the town has accepted with reverent acknowledgment.

The fact that she gave her money to the public schools indicates that she loved her work, but the fact that she gave her life to the schools proves it better. The town can never repay to her memory adequate recompense for her sacrifice—but she does not need payment. Her life was full of rewards, even tho it closed in pain and sorrow and suffering. These are small things compared to the joy a soul finds in service.

In another Western town, not far removed from the first, died recently a "character," a bachelor who had worked thru the years with little recognition in the social world and apparently with small standing among the leaders of the community's life. His will provided that $30,000, the savings of his lifetime, should build for the town a public library, his gift to the place in which he had humbly toiled.

These incidents are not prodigies, nor are they the doings of eccentrics; they are types of a growing sentiment in this country that the town in which we live deserves from us some return for the joy it bestows year after year upon us. The East, with its long-established families, its possession of entailed wealth, has known this secret for decades; the South, rich in tradition and prestige, realizes it; the West is just coming into the satisfaction of fulfillment of the duty toward one's neighbors.

A town of tenants and of landlords is a misnomer and a failure; a town of homeowners is one great family, in which each owes to the other something of courtesy and of return for benefits received. It is doubtful if the dweller on city boulevards realizes the sentiment that animates the resident of the country town. The mutual dependence, the community helpfulness, the thoro understanding of the business and social status of one's neighbors, all these tend toward a sentiment of respect and admiration for the town that finds expression in reciprocal deeds of usefulness.

After all, our attitude toward our neighbors depends upon the view with which we consider the community as a whole. If it be to our mind merely a place in which to make money, an opportunity to reap financial benefits because people must pay us tribute, a narrow and unsympathetic picture is certain to present itself and the result is the unloved citizen who squeezes his neighbors' purses and blights their lives that he may thrive. If the viewpoint be one of mutuality, if the town be looked upon as one great family in which the uplift of all means the advantage of each member of the community, if a spirit of helpfulness be abroad, if good cheer and courtesy reign, there is radiated from the town a wholesome, generous kindliness that makes it what the Westerner terms, "a good town to live in." The difference between a town good to "live in" and one good merely for business purposes should need no discussion; the difference ought to be patent to the most casual observer. Living is one thing and business another of so different caliber that there is no comparison between them. The town that goes in for business alone makes the same mistake as the individual who pursues his life under the false impression that there is nothing higher toward which he should aspire than a bank account; the town that goes in for mutual interest, that tries to inculcate a spirit of good cheer and frowns on bickerings and bad feeling among neighbors, is on the road toward good living and is in a position to invite population on the

best ground of all—that it is "a good place to live in."

We owe a great deal to our town, to our neighbors. From our surroundings comes the joy of living, and the greater our return of goodwill the greater shall be our reward.

When a Trust Is Not a Trust

In this country we apply the opprobrious epithet "trust" to almost anything that we are afraid of or don't like. It is too promiscuous to be libelous. But in England it is different. Last fall the soapmakers of Great Britain formed a combination for the purpose of checking competition and curtailing advertising expenses. These aims being contrary to the interests, certainly of the newspapers and presumably of the public, the former aroused the latter to an attack by means of the boycott. The "non-trust" soaps were given free and extensive advertising. People declined to buy the favorite brands that they and their ancestors had used for a century, and refused even to enter the shops where they were sold. As a result of this vigorous action the soapmakers promptly repented of their incursion into what is known across the water as "American finance." Regretting that their benevolent aims had been so misinterpreted, they dissolved whatever combination or mutual agreement they had.

But the yellow journals crowed too soon over their victorious defense of the rights of the people. William Hesketh Lever, who makes Sunlight Soap and attempted to make the combine, had a reputation of value to himself, being the Liberal Member of Parliament for the Wyrrol Division of Cheshire. He brought suit for libel against the Harmsworth papers, the London *Daily Mail* and *Evening News,* which had charged Lever Bros. with establishing a trust and also cutting down on the weight of their bars of soap. The Levers produced evidence in court that their sales had fallen off $200,000 the first week after the Harmsworth attack, and that they had lost a million dollars in consequence of the reduction of their sales and the value of their stock. The defendants put in a plea of justification, but after two days agreed to withdraw their charges and pay $250,000 damages and the costs rather than await the verdict of the court. If all the newspapers in this country had to pay $250,000 whenever time they accused a business corporation of forming a trust or of fraud, without being able to prove it, some of them would in time be driven into bankruptcy.

Educational Aspirations

One who wishes to keep informed of the aspirations for better educational and religious conditions in the South should not overlook the successive numbers of *The South Atlantic Quarterly,* published at Trinity College, Durham, N. C. Trinity College is under the control of the Southern Methodist Church, as is Vanderbilt University, at Nashville, Tenn.; and of all institutions wholly under white Southern control none are doing more for right feeling, mutual understanding and progress in every right direction. Such men as Chancellor Kirkland and Professor Gillett at Vanderbilt and President Kilgo and Professor Mims at Trinity are a force for generous right thinking not to be overlooked.

In the July number of *The South Atlantic Quarterly* President Kirkland discusses the Southern college. He tells a sad story, but a well known one, of its present inefficiency and indicates what is being done to create a higher standard.

A multitude of Southern colleges have the ambitious name, but are no more than passable high schools. In any well co-ordinated system of education there must be a sharp distinction between the secondary school (high school) and the college. But no such distinction has existed in the South. The larger part of the high-school work, says Chancellor Kirkland, has for forty years been done by "illegitimate institutions," not calling themselves high schools at all:

> "This work is done today by normal colleges of every grade and description, by a whole host of colleges and seminaries for young women, by preparatory classes in colleges and universities and technological schools, and, finally, by college classes themselves in the same institutions."

The States, he says, need to reorganize their system. State normal schools

ought to require two years in the high school for admission. Schools of technology are teaching the elements of grammar and arithmetic to the neglect of agriculture and engineering. For example, an agricultural and mechanical college in the South, which has the Morrill fund, has more than 700 students, of which about 600 are doing high-school work. A certain State university takes pupils even from the eighth grade of the grammar school, and if such students were excluded the enrollment would shrink from 400 to 100.

The Carnegie Foundation calls that institution a college whose requirements for admission are expressed by 14 units, each unit representing a year of high-school work above the eighth grade, with five daily recitations a week for a year. That rule would exclude pretty nearly every college in the South. Instead of 14 units, one of the best colleges in its section, aided by the Rockefeller General Board of Education, requires but 5½ for admission, altho Latin must be added for a degree, which brings the requirement up to 8½. But another institution requires only 5½ units and on that basis gives any degree without either Latin or Greek. These are not low-grade institutions, and there are others much worse. Even the best institutions need to stiffen their requirements for admission. Thirteen years ago there was organized an association of Southern colleges pledged to have no preparatory department, to require written examinations and entrance examinations for all candidates for degrees covering 10½ units of high-school work. At that time there were only six institutions in the South willing to enter into this agreement. Twelve others have joined since, but not all of them adhere strictly to the agreement. There are whole States in which no college or university reaches this rank.

These are the better institutions; but for every one of them there are half a dozen of a lower grade, called colleges or universities, and giving worthless degrees, deceiving their pupils and the public. Says President Kirkland:

"It is a crime to sell or give away educational degrees without any attempt to maintain honest standards. Any group of persons so desiring, in almost any State, without an acre of land or a building or a dollar's worth of property, can secure a charter authorizing them to confer all literary and professional degrees. . . . Over and over again have I come in contact with lives that have been marred and almost ruined by the work of such institutions."

The South is now rich enough to require and provide, at least in its State universities, a standard of admission which shall equal the requirements in reputable Northern colleges. But this involves a vast improvement in the high schools. Raise the college standard, and that will compel the high schools to follow. Very few are the high schools in the South that could supply the 14-unit standard. We doubt if one such can be found, altho there are those which claim to give a four years' course for white youth.

Charleston, S. C., is an example of an ambitious and prosperous Southern city which begins to recognize, at least, the low standard of its public school system. We take from our able contemporary, *The News and Courier*, an account of its schools as given by Principal Tate, of the Memminger Normal School. He says Charleston pays less per capita for educating its children than any other city of its size in the country. Less than 10 per cent. of the cost of city government goes to education. No other city of its size pays more for police than for schools. The average salary of teachers is just about that of the street-sweepers. The cost per pupil for schools in Charleston is $13.33⅓; in New Orleans it is $27; in Atlanta, $22; in Nashville, $21; in Richmond, $20; in Birmingham, $19. These are all very low figures, and the leading journal of the State calls for an advance. Will the citizens tax themselves? It is cheaper to educate the children than to pay the police.

Venezuela's Refusal

If Venezuela stands stubbornly by her announced determination not to pay The Hague tribunal's award, which condemned her to pay $2,000,000 to her Belgian creditors, it will be a very serious matter for her. There has as yet no international way been found to compel a derelict nation to submit to an award of

The Hague to which it has accepted reference, but a way will be found in any such case. The fact is that it had not occurred to any one that any nation would or could do so ungentlemanly a thing as to decline to keep its promise and falsify its word. But it seems there is one such freebooter nation, and the nations of the world will find some more effective way than even the boycott to bring it to its senses. The Belgian Minister of Foreign Affairs says the Government will spare no effort to protect Belgium's interests; and whatever drastic measures it may decide upon no other nation will object, so long as the occupation of Venezuelan territory does not impinge on the Monroe Doctrine. But we presume that Belgium will first ask the United States, as a sort of responsible protecting Power, to put pressure on Venezuela to pay its debts; and it may, if she refuses, be necessary for us to take possession of the ports and collect the revenue until the debt is paid. We must not fail to understand the duties correlative with the Monroe Doctrine. If we tell other nations not to take possession of the territory of American countries, we must see to it that they observe international obligations. Fortunately there are only one or two such dubious countries, and it may be well to ask Mexico or Argentina to join us in the unpleasant duty.

Returning Sanity

With the imprisonment of San Francisco's Mayor, and the appointment of an honest man to take his place, and the absolute overthrow of the vile element that has ruled the city and made its name odious, has come the return of sanity on the Japanese question. The Merchants' Exchange of San Francisco has announced that it does not favor any immigration law that will discriminate against the Japanese, or permit them to be treated any differently from the people of any other country. They wish no barriers to friendly trade relations between the two countries. This looks as if the fear of the tyrannous hoodlum element were past away, which is sincerely to be hoped. It is not the decent and substantial citizens of San Francisco that have made the trouble, or have fostered the attack on Japanese and Chinese which has so affected Congress and created our anti-Mongolian legislation. It is a shame that a Chinese or a Japanese should not be allowed to land and become a citizen as well as a German or an Englishman. The ground of the attack has really been that the lowest element of the population wanted a monopoly of certain forms of labor, and wished no competition, and that when there was a scarcity of labor. The return of sanity on this matter is aided by the report of conditions in Hawaii, where the Orientals, Japanese and Chinese are freely admitted and form half the population. Governor Carter says that there is no anti-Japanese feeling in Hawaii. He adds:

> "Twenty-five per cent. of the children in the Territorial schools are Japanese, studying side by side with the whites, and there has never been even an intimation of a demonstration. I regard the Japanese as desirable."

That is as might be expected under civilized conditions. Children are by nature democratic, and have to be taught race hatred. Governor Carter said this at Seattle, and we may imagine that the possibility that Japanese trade will be diverted from San Francisco to Seattle may have helped the conscience of the San Francisco Merchants' Exchange. It will not be for the interest of Seattle commerce to imitate San Francisco, and California will not be pleased to see the Pacific trade moving northward.

The Elks, who, we understand, are a social and incidentally benevolent organization like the Masons, had a costly celebration and parade in Philadelphia on one of the hottest days last week, when two or three thousand spectators and paraders collapsed with the heat, and scores died of sunstroke. The scene was like a battle, as the hospitals were swamped, and the victims were laid in rows on the grass. Nothing like it was ever seen here. Very likely the hysteria of a crowd-madness had something to do with it, but it seems strange that such a parade should be arranged for the severest heat of July. And it is provided that the next parade shall be at the same date

in Texas. One good thing may be said for the Elks: they have voted to give up the elk's tooth as their badge, for the elks were being exterminated thru the country, like the buffalo.

The invitation of the Meadville Theological Seminary (Unitarian) to Prof. Henry Preserved Smith, D.D., to take the Old Testament chair, which he accepts, is in the line of a more scientific rather than dogmatic view of theological studies, and reminds one of the fact that others than Unitarians are now professors in the Harvard Divinity School. Professor Smith was one of the two martyrs of the Briggs controversy, having then been suspended from the ministry by the General Assembly, when he joined the Congregationalists and was for a time professor in Amherst College. He is the author of several scholarly works of much value. It is distinctly understood that in going to Meadville Professor Smith is not expected to change his present ecclesiastical relations.

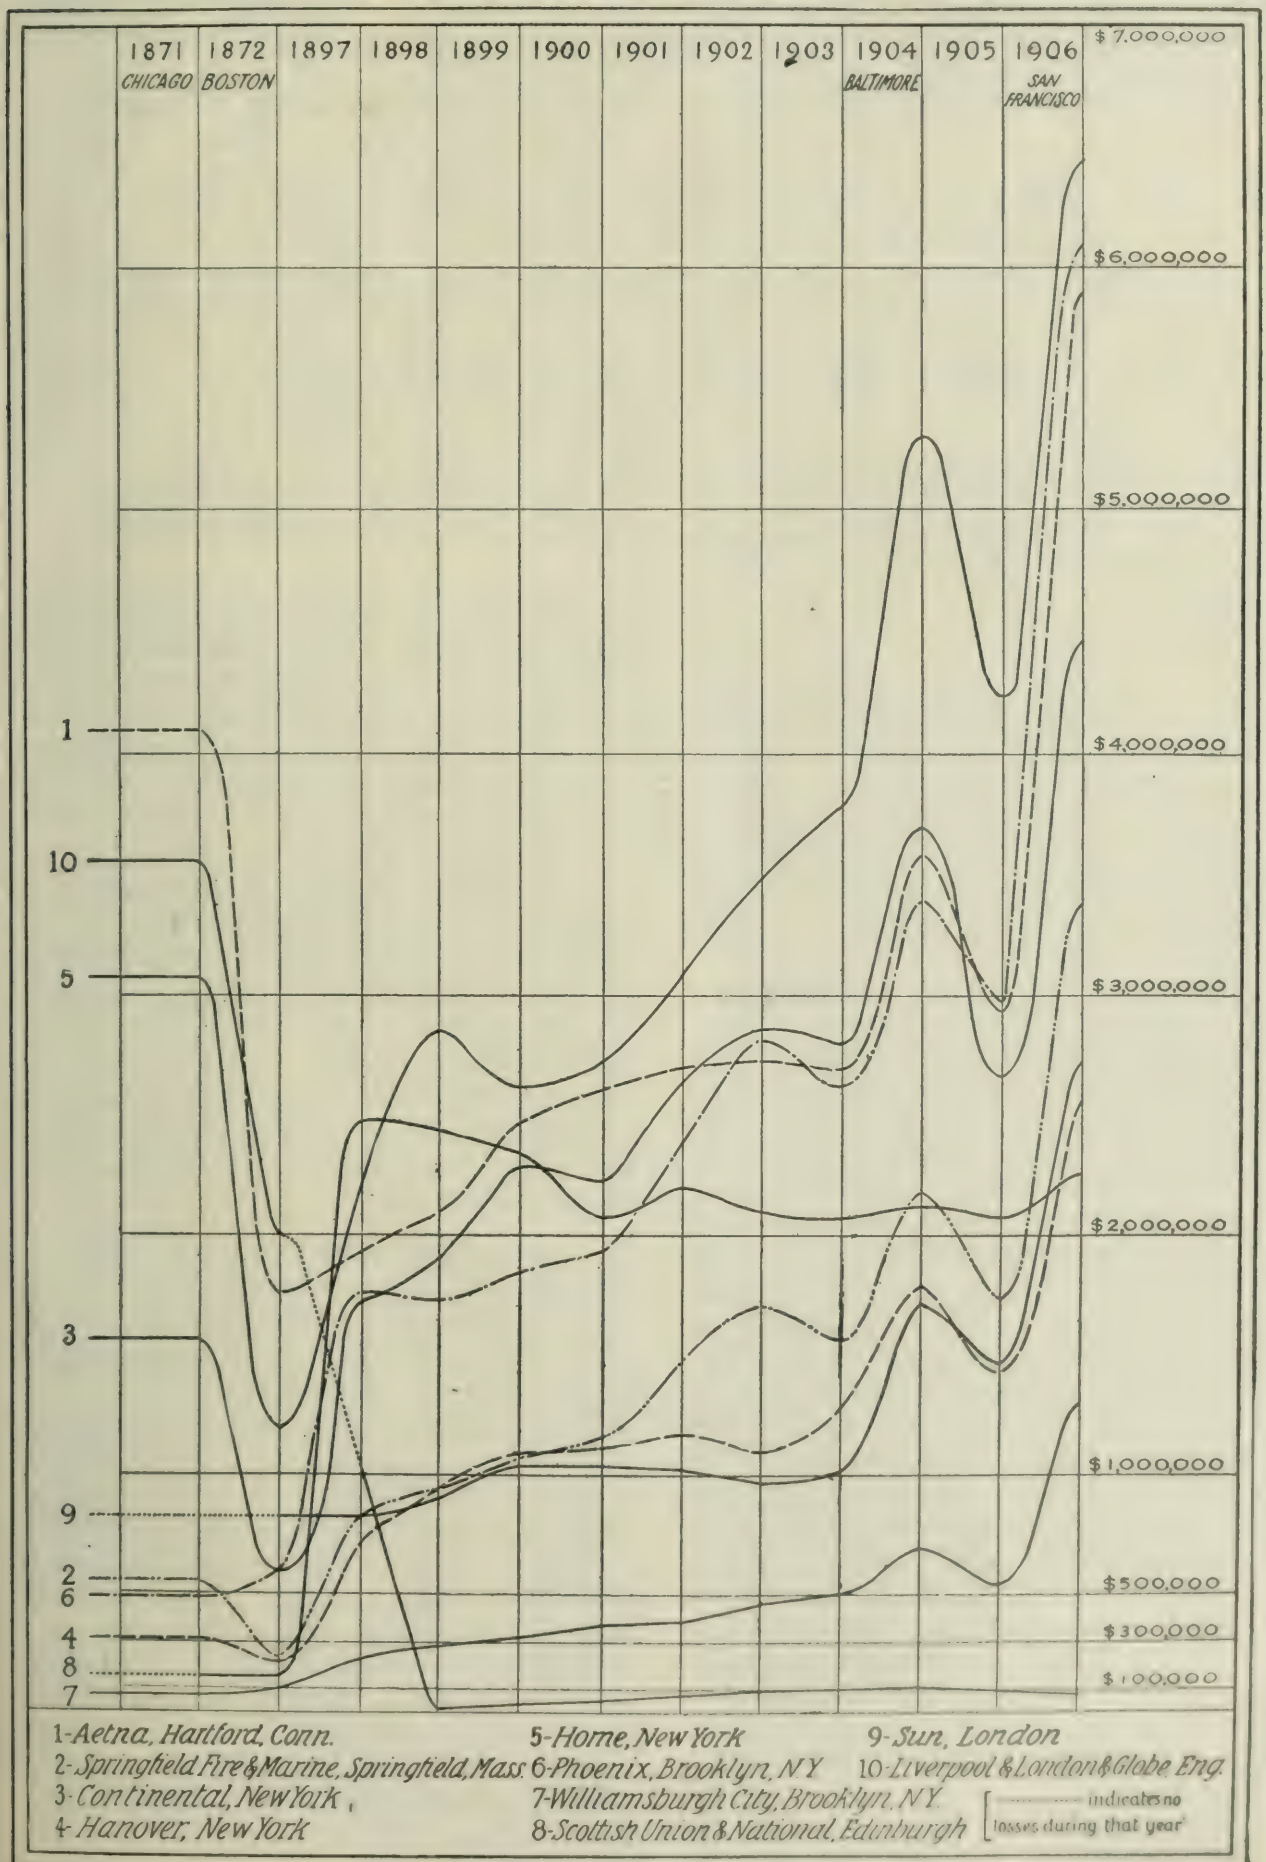
The separation of Church and State in Europe moves steadily on, since the bitter conflict which achieved its success in France. The Canton of Geneva has decreed it by a vote of 63 to 23, almost three to one. The Catholic members of the Grand Council voted for it, after first setting themselves right by declaring that they would have preferred a law which gave subventions equally to all churches, but in default of that favored a law that equally gave aid to none. In Spain and Italy the question is before the public and the parliaments, and in England the Non-Conformists are angry because no bill has been proposed by the Liberal Government for the disestablishment of the Church in Wales.

The president of the Richmond, Va., Chamber of Commerce, Mr. James R. Gordon, must himself obey the Jim Crow law, or the law cannot be enforced at all. He does not like it that he was not allowed to ride in a negro car and smoke where he wanted to, and he appeals from his fine of $10. It is really too brazen to say that a black man must obey the law, but a white man need not. It is a step toward fairness when the Interstate Commerce Commission has decided that cars for negroes must have every accommodation that cars for whites have, down to towels and washbowls, even altho it cannot invalidate the foolish law.

If a man does you or any of your family a social wrong, shoot him, kill him—that is the "unwritten law" which Governor Vardaman, of Mississippi, sworn to maintain the written laws of his State, has just pronounced emphatically in the case of the pardon of a woman who had shot her physician. She was condemned by judge and jury, but the Governor pardoned her without waiting for her to be taken to jail, saying of the "unwritten law": "I believe it should prevail in this State." That is lawlessness, which is barbarism, anarchy.

The dean in charge of the administration of a New England college writes us:

> I am not sure that I ever read an editorial utterance so frankly and clearly expressing my own sentiments upon college life and who should live it, as does "After the Commencements" in *The Independent* of July 18, which I have just opened.



We are not glad that so competent an observer finds that our description of current evils was so nearly correct.

It is a very serious matter for the Governor of North Carolina to attempt to resist by force the courts of the United States. He had better think what nullification would mean. In such a case as this it would be safe to allow an appeal to the United States Supreme Court from the Circuit Court, for there must be no clash between the Nation and a State. That does not pay. It has been tried.

The Georgia Legislature has one negro member. His seat was contested by a white man, but the negro was given the seat for the excellent reason that he was legally elected, and the evidence proved it. We thank the Georgia correspondents who have called our attention to a creditable fact, which we are glad to record.

TABLE SHOWING FLUCTUATIONS OF LOSSES IN TEN FIRE COMPANIES (SELECTED AT RANDOM) FROM 1897 TO 1906.

The Chicago fire of 1871 and the Boston fire of 1872 are included for comparison. Based on the *Argus* insurance chart.

Financial

Fiscal Year's Foreign Trade

ALL previous records were broken by the foreign trade of the United States in the fiscal year ending with the month of June. When comparisons with the figures of the preceding year are made, the new totals show an increase of nearly $207,000,000 in imports and of almost $137,000,000 in exports. The sum of our exports and imports has now risen to $3,315,252,116, against $2,970,426,946 in 1906, and only $1,815,000,000 ten years ago. How our trade with foreign nations has expanded is shown by the following table:

Fiscal year.	Exports.	Imports.	Excess of exports.
1907	$1,880,851,024	$1,434,401,092	$446,449,932
1906	1,743,864,500	1,226,562,446	517,302,054
1905	1,518,561,666	1,117,513,071	401,048,595
1904	1,460,827,271	991,087,371	469,739,900
1903	1,420,141,579	1,025,719,237	394,422,422
1902	1,381,719,401	903,320,948	478,398,453
1901	1,487,764,991	823,172,165	664,592,826
1900	1,394,483,082	849,941,184	544,451,898
1899	1,227,023,302	697,148,489	529,874,813
1898	1,231,482,330	616,049,654	615,432,676
1897	1,050,993,556	764,730,412	286,263,144
1896	882,606,938	779,724,674	102,882,264
1895	807,538,165	731,969,965	75,568,200

Some reference to the movement of gold and silver should be made. Imports of gold exceeded exports by $63,000,000, the excess having been a little larger than in 1906. In the case of silver, on the other hand, there was an export excess of $13,820,000, but this was less than that of any other year since 1892, the export excess in each of the five years ending with 1906 having been about $21,000,000.

Analysis of the tables of imports shows that the growth has been due largely to the purchase of manufacturers' materials. The increase of crude materials has been from $200,000,000 in 1899 to about $485,000,000 in the past year, and (during the same period) that of manufactured articles, for further use in manufacturing, from $92,000,000 to $275,000,000. In the same eight years our exports of manufactures ready for consumption have grown from $263,000,000 to $470,000,000, and our exports of crude materials of manufacture from $278,000,000 to $600,000,000.

Agricultural products exported last year amounted to $951,634,669, the largest total ever reported, cotton ($481,000,000) having been the most important item. The value of cotton exported in 1906 was $400,427,000, which was considerably in excess of the total for any previous year. An increase of $80,000,000 in cotton and $34,000,000 in wheat (and flour) was met in part by the following decreases: Corn, $18,000,000; oats, $14,000,000; barley, $4,000,000; cattle, hogs and sheep, $7,000,000; meat and dairy products, $10,000,000. But the net increase of the total was $61,000,000.

*

....For the two years ending with May, the New York stock transfer tax yielded $12,064,471, of which about $10,500,000 was derived from transactions on the New York Stock Exchange. When the law was enacted, it was estimated that the tax would yield about $4,000,000 a year.

....June's output of pig iron was 2,231,575 tons, May's having been 2,295,505. The output for the first half of the year has been about 13,500,000 tons. In the entire year of 1906 the product was 25,307,191 tons. Since January 1st ten new blast furnaces, having a capacity of 1,340,000 tons per annum, have come into operation, and twenty-six more are now being built.

....Massachusetts has a new direct inheritance tax law, supplementing former legislation taxing collateral inheritances only. The tax on collateral inheritances above $1,000 (charitable, religious and educational institutions excepted) is 5 per cent. Under the new law, direct inheritances by father, mother, husband, wife, and lineal descendants up to $10,000, are exempt. Above that sum the tax is graduated from 1 to 5 per cent., the largest rate applying above $250,000. Inheritances by brother, sister, nephew or niece are exempt up to $1,000, and above that sum are graduated from 3 to 5 per cent., those exceeding $100,000 coming under the latter rate. It is thought that the new law will yield an annual revenue of $1,500,000.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Railroads Yield to Governor Glenn

An agreement providing for a peaceful and orderly settlement of the controversy over the new passenger rate law in North Carolina was reached on Saturday night, the Southern Railway and the Atlantic Coast Line accepting a proposition made by Governor Glenn on the 25th. The terms of the agreement are that the railroads shall adopt the prescribed rate of 2¼ cents a mile, beginning not later than August 8th; that the State shall appeal to the United States Supreme Court from Federal Judge Pritchard's order discharging upon writ of habeas corpus the Asheville ticket agents sentenced to the chain gang; that the Southern Railway shall appeal to the highest State court from the imposition of a fine at Raleigh, and, if defeated, shall take the case up to Washington on a writ of error; that the State may indict the Atlantic Coast Line once, as a basis for further action; that both parties shall co-operate to procure a speedy determination of the whole matter; that all pending indictments and prosecutions, except those to be used in appeals, shall be dismissed and that there shall be no new ones; and that the Governor shall advise all persons against bringing any penalty suits pending a final decision of the main question as to the constitutionality of the statute. This victory for the State authorities was won at the end of a long conference in which the Governor, his counsel and the railroad attorneys took part. A few hours earlier, the situation had been made more menacing by the arrest at Asheville of W. W. Finley, president of the Southern, upon a warrant issued by a police magistrate, and his speedy release by Judge Pritchard, before whom he was brought upon a writ of habeas corpus. Preparation had also been made for a second arrest of ticket agents recently discharged by Judge Pritchard, and for holding them in the custody of a State judge. This might have led to the use of force by the Federal authorities. It was known that the Governor had decided, if his terms should not be accepted, to call a special session of the Legislature and ask for an annulment of the Southern's charter. A line nearly 300 miles long, operated by the company, is owned by the State. An attempt to cancel the lease of this line would have been made. Speaking of the agreement, Governor Glenn said on Saturday night that he regarded the victory as one for State rights. The people, he continued, were determined that they "would not submit to the oppression of the railroads or to the interference of the Federal courts," and if all the other States "would take up the fight to curtail the growing power of these courts" there would be no difficulty in controlling the railroads and other corporations. Commenting upon the case, Senator Overman remarked that the two leading planks of the Democratic national platform next year ought to be tariff revision and the preservation of State rights.——The record of events preceding the agreement may be summarized as follows: On the 22d, at Asheville, Judge Pritchard, in a long opinion, declared that the penalty clause of the new law was unconstitutional, pointing out that the penalties, if en-

forced for the sale of each ticket, would amount to $2,500,000 a day, and that the enforcement of them would close the doors to a judicial hearing. He then discharged the two ticket agents who had been sentenced to the chain gang. The Federal Court, he asserted, had in all the proceedings simply pursued the regular practice which the United States Supreme Court had approved, and it must preserve its jurisdiction. He hoped there would be no conflict, but if conflict should occur he would not evade his responsibility. An appeal was taken. Assistant Attorney-General Sanford came down from Washington, conferred with the railway attorneys, and obtained their approval of a proposition which he caused to be submitted to the Governor. This proposition the Governor rejected, because it did not provide for obedience to the law pending a final decision. The substance of it was that both parties should use all possible efforts to hasten a decision by the court of last resort, and that there should be no additional prosecutions in the meantime. Governor Glenn in reply submitted the terms which were afterward accepted without modification except with respect to the date for beginning to obey the law. He had asked for immediate obedience, but good reasons for delay until August 8th were given. When Mr. Sanford arrived the railway companies' attorneys were considering the project of seeking an injunction restraining all attorneys or other persons in the State from bringing suits against the companies under the law. Owing to his disapproval this was laid aside.——In the Federal Court at Omaha, Judge Munger has decided that the new State law reducing express rates by 25 per cent. is constitutional. Application from the express companies for an injunction restraining the enforcement of the statute was denied.——Three prominent milling companies in Minnesota, indicted for accepting rebates on grain from the Great Northern, pleaded guilty last week and paid small fines.

Acquittal of Haywood

William D. Haywood, secretary and treasurer of the Western Federation of Miners, who for some weeks past has been on trial at Boise, Idaho, for the murder of ex-Governor Steunenberg, was acquitted on the morning of the 28th, the jury having been out eighteen hours. On the first ballot eight voted for acquittal and two for conviction. Two declined to vote. On one of the succeeding ballots there were four for conviction. Samuel D. Gilman was the last to stand out against acquittal. It is said that the four who for a time voted against Haywood were the jurors who had been regarded both by the prosecution and by the defense as especially friendly to his cause. It is shown by the statements of jurors that the judge's charge made it impossible for a majority of them to vote for conviction. Of the 65 paragraphs in the charge, 31 dealt with the subject of reasonable doubt. There were jurors who did not believe Orchard's story; there were others who held that the corroboration of it had not been sufficient. When Orchard was told in the penitentiary that Haywood was free, he said:

"I have nothing with which to reproach myself. I have told the truth in the interest of justice, and that is all there was for me to do. I am tired of the strain and suspense, and I hope my trial will be set quickly. I am anxious to have it over with, and am ready to pay the penalty for what I have done."

Governor Gooding says that the verdict was a great surprise to him:

"I have done my duty and my conscience is clear. As long as God gives me strength I shall continue my efforts for government by law and for organized society. The State will continue a vigorous prosecution of Moyer and Pettibone and Adams, and of Simpkins when apprehended. There will be neither hesitation nor retreat."

It is expected that Pettibone will be tried in October. Haywood will return to Denver and resume the work of his office. He says that he never feared the result of a fair trial, and he expresses gratitude for the support given to him by representatives of labor in the court-room and elsewhere. Socialists in the cities rejoiced publicly on the 28th over the verdict.

Trust Laws and Suits

In an address before the Wisconsin Bankers' Association, last week, Charles G. Dawes, formerly Comptroller of the Currency, criticised the Sherman Anti-

Trust law and urged that it should be amended. His views were like those recently expressed in THE INDEPENDENT'S editorial pages. The law, he pointed out, made unlawful and criminal even such agreements in restraint of trade as are beneficial to the public. Agreements to preserve a high standard of manufacture, to prevent sales below cost, or to prevent at any point an oversupply of perishable commodities, he said, were prohibited. Agreements made for the purpose of extorting unreasonable prices should be under the ban. Because the law did not clearly define the crime, he continued, scrupulous men refrained from making beneficial agreements, but unscrupulous men violated the statute with greater impunity, knowing how difficult it is to enforce a law which makes innocent acts and guilty acts equally criminal. Amendments should clearly define the offense. Trade agreements should be considered by a commission in their relation to the public interest. "Beneficial trade agreements should then be legally sustained; bad ones should be forbidden and, if consummated, punished."——It is announced that the Government will begin its suit against the Powder Trust this week, at Wilmington, Del. The head of the combination, T. Coleman Du Pont, is chairman of the Delaware Republican Committee, and a cousin of Senator Du Pont, who is interested in several of the corporations.——In Mississippi the State has sued the Standard Oil Company to recover $1,480,000 in statutory damages for violation of the local Anti-Trust law. ——The Attorney-General of New York has brought suit against the Western Union and Postal Telegraph companies for annulment of their charters, alleging that, owing to a business agreement, they constitute an illegal monopoly. The existence of such an agreement is denied by the defendants.

The Situation in San Francisco

It appears that Dr. Taylor was the third person who was asked to take the office of Mayor of San Francisco after Schmitz had been sentenced and Boxton had resigned, Dr. John Gallwey declined the place because he was not, he thought, qualified for it by temperament or professional experience. Ralph C. Harrison, formerly judge of the Supreme Court and afterward Chief Judge of the Court of Appeals, would not accept, because he feared that at his advanced age the strain of the work would be too severe. Mayor Taylor, retaining Tveitmoe and O'Neill, who were appointed by Schmitz and were not smirched by the investigation, has appointed sixteen new supervisors, as follows, in the places of those who confessed their guilt:

A. D. Ancona, physician; Joseph P. Booth, editor; H. U. Brandenstein, attorney; Gustav Breuner, retired merchant; George H. Center, real estate dealer; A. Compte, Jr., attorney; Bernard Raymonville, insurance agent; Thomas Magee, real estate dealer; D. E. J. Molern, president Academy of Sciences; Charles A. Murdock, printer; D. D. Murphy, attorney; Henry Payot, merchant; Loring H. Rixford, architect; Lipman Sacks, merchant; G. W. Stafford, merchant; M. I. Sullivan, attorney.

In this list there is no representative of the labor unions, because no prominent unionist would serve. But Tveitmoe and O'Neill are union men. To an industrial peace conference held last week the street railway company sent as delegates President Calhoun and two other officers under indictment. The conference asked that these be withdrawn, saying it could not recognize indicted men. President Calhoun replied that this was a cowardly act. At the trial of Louis Glass, Emil J. Zimmer, vice-president of the telephone company, who had served five days in jail for refusing to testify, was again placed on the witness stand. He again refused to answer and was again sent to jail for five days. Glass is defended by Mr. Delmas, who defended Harry K. Thaw. In court he attacked Prosecutor Heney, calling him a "human blood hound," and saying that the late Senator Mitchell was one of his "victims." The wife of Supervisor Boxton testified that her husband brought home and gave to her the $5,000 with which he had been bribed by the telephone company's manager, Halsey, who is soon to be tried.

The Philippine Islands

Reports from Manila say that the entire number of voters registered in the archipelago for the election of members of the new Assembly, to be held this week, does not exceed 60,000, which is

about 10 per cent. of those entitled to vote. In Manila, whose population is 225,000, only 7,902 names have been placed on the lists. In spite of the strenuous efforts of party leaders, there has been very little popular interest in the movement.——Some time ago, Sakay, Montalon, Villafuerte and Devega, chiefs of marauding bands of ladrones, were tried, convicted and sentenced to suffer death. The sentences have now been confirmed by the Supreme Court. This action will affect the popularity of Dominador Gomez, an agitator who is prominent in the Nationalist party. As an intermediary or agent of the Government, he induced Sakay to surrender, and is said to have promised that this outlaw should escape severe punishment. ——Among the Filipino students at the Cornell University summer school, two or three in public addresses, professing to represent the opinions of the islanders, have expressed opposition to American rule and even a preference for the rule of Spain. Others, including a nephew of the Mayor of Manila, have replied to these remarks with some indignation, asserting that the people regard American rule with satisfaction, except in the matter of tariff duties.

Cuba and Porto Rico

When our Government's plans for restoring home rule in Cuba were made, some months ago, it was thought that the municipal elections, which are to be the first test, could be held in September or October of this year. So much time will be needed for taking and tabulating the census, however, that these elections must be deferred until January or February.——A curious story about plans for an uprising in the Province of Santiago has been widely published. American military officers sought to improve the appearance of the grounds of the Morro fortress by setting out one hundred young cocoanut palms. Six years must elapse before these will bear fruit. A rumor spread that the Americans intended to remain until the fruit should appear. Secret meetings were held (it is asserted), revolutionist leaders were consulted, and an attack upon the troops was planned for July 12th. Secret service agents discovered the little plot, so the story goes, and checked the revolutionists by pointing out the absurdity of their reasoning.——Señor José de Diego, Speaker of the Porto Rican House, has come to Washington. His purpose is to prevent, if possible, an increase of the French duty on Porto Rican coffee. At the same time he asks that Congress, for the protection of the coffee of the island, shall impose a duty upon all imports of coffee into this country from other sources. The plea for American citizenship and for an elected Senate is made again by him. Admitting that the sugar and tobacco industries of the island have been greatly stimulated by annexation, he remarks that these are controlled by corporations or capitalists, while coffee is produced by small farmers and the people generally. An increase of the French duty, he says, would be a very severe blow to this industry.——July 25th was the ninth anniversary of the landing of American troops in Porto Rico. Altho it was a legal holiday, there was no celebration of the anniversary in any town on the island.

Central America

It is now reported that Nicaragua will not attack Salvador. Nicaragua's Minister at the Mexican capital has suggested that Salvador's claim for damages on account of the recent raid upon Acajutla and Sonsonate by an expedition sent from Nicaragua be submitted to President Diaz for arbitration. To this Salvador may consent. Until this matter shall have been adjusted, Salvador and Guatemala will decline to take part in a Central American peace conference at Washington. Two of the Moissant brothers, American citizens owning large plantations in Salvador, who were imprisoned upon the charge that they assisted the raiders at Acajutla, have been released, owing to the interposition of the American Minister. Another brother fled with the raiders when they were defeated. Complaint was recently made by the resident Ministers of several European countries at the Guatemalan capital because final action concerning the sentences of persons convicted of complicity in the attempted assassination of President Cabrera had not been taken. On the 26th, the death sentences of the lower tribunal were con-

firmed by the Supreme Court.——The new treaty with Santo Domingo has been proclaimed by President Roosevelt. Owing to prevailing prosperity, the salaries of the island's executive officers and legislators have been increased.——President Diaz appointed a committee to provide for the celebration, on September 16th, 1910, of the centennial anniversary of Mexican independence. This committee has decided that on that day the construction of public improvements of various kinds shall be begun in more than 900 cities and towns, and it is estimated that the cost of these projects will be nearly $100,000,000.——On the 25th, Venezuela, replying to a note from Secretary Root, again refused to submit to arbitration the five American claims (those relating to the asphalt concessions included) which have been the subject of much discussion.

The Hague Conference

The most important event during the past week at The Hague was the adoption of the principle that debts shall not be collected by force except after a recourse to The Hague Court. Thirty-seven nations have endorsed this proposition while seven, including Switzerland, Belgium and Turkey, abstained from approving the scheme. This proposition has been under the direct charge of General Porter, of the United States delegation, and is a personal triumph for him. As we have explained before in THE INDEPENDENT, this proposition, which is a modified form of the Drago or Calvo Doctrine, will practically prevent war between the Old and the New World. The other American propositions are still under discussion. Our plan as outlined last week for strengthening of The Hague Court will probably be accepted with some amendments to which, however, the American delegates will offer no objections. Also our scheme for a general arbitration treaty is meeting with some opposition, but the British delegation and the German delegation are supporting America and the matter will probably go thru in the end. Mr. Stead, who is editing *La Revue de la Paix*, which is serving a very useful purpose as a medium between the conference and the outside world, is thoroly disgusted with the British delegation. "As members of a conference striving for peace ideals," he says, "they are about the most incompetent set of beings that ever achieved an unmitigated failure." It has been decided in regard to signs that are to be hoisted over buildings to be spared during a bombardment, that they shall consist of a large rectangular panel of wood or linen divided into triangles, the upper triangle being black and the lower white. The proposition of England that contraband of war be abolished has been utterly defeated thru Germany's opposition. Lord Reay made a long argument for this proposition, but Dr. Kriege, the Germany delegate, declared a complete negative of the proposition. Mr. Bartholdt, of our Congress, and the ex-president of the Interparliamentary Union, reports from The Hague that the outlook is bright and that he is especially interested in promoting two things, first, the automatic continuance of the Conference, and, second, the codification of international law. It is expected that the Conference will take action on both of these subjects. The president of every delegation was entertained at a banquet on the evening of the 22d by Queen Wilhelmina, who presented each guest with a beautiful commemorative medal, on one side of which was stamped a representation of the Hall of Knights where the Conference is held, over which was rising the sun, signifying justice, and on the reverse an inscription with the date. After the dinner the Queen spoke to all the delegates and is said to have told Mr. Choate that she desired to visit the United States. It is rumored that Russia wants to bring the Conference to a close by the 20th of August, but that will probably be too early.

England and Ireland

The Evicted Tenants' bill, which past the House of Commons on its second reading, met with strong opposition in the committee proceedings. Mr. Augustine Birrell, Chief Secretary for Ireland, had stated to the House that he contemplated the reinstatement merely of the 2,000 claimants for whom the Estates Commissioners had estimated in their special report that holdings should be provided, and 8,000 acres were given as

the amount of land necessary for their reinstatement. In the committee of the whole an effort was made to force Mr. Birrell to limit the scope of the bill to these figures, and when he refused the bill was opposed on the ground that it placed an unlimited and arbitrary power in the hands of the two commissioners, who, if they saw fit, could approve of the whole 8,400 claimants and give them forty acres apiece by evicting present tenants of any land. According to the bill a *bona fide* farmer who had for twenty years occupied and cultivated his farm might be evicted to give way in favor of the representative of some former tenant. Mr. Birrell and Mr. Redmond argued in defense of the bill that this power was, in the opinion of the Government, absolutely necessary in order that the social and political objects of the measure might not be frustrated. Many of the planters are not *bona fide* farmers, and there would be no injustice in removing them. Compulsory power was necessary, because in some cases an obstinate man who insisted upon his legal rights and refused to go might keep a whole county in a state of turmoil. "There must be," the Attorney-General said, "some limit to the expense to which a state is put in providing protection for an unpopular man." The Opposition seized upon this as an admission that if the Irish agitators only made it hot enough for a "land grabber" the Estates Commissioners would get rid of him for them.——The split between the Sinn Fein Society and the Nationalists under John Redmond continues to grow, and it appears to be largely the fear of losing the money contributed from America for the Irish cause which maintains a nominal unity. Sir Thomas Henry Grattan Esmonde has come out openly as a Sinn Feiner. He declares that:

"Parliamentary agitation is worthless, since England would never give home rule or any other concession for the asking. Ireland is no colony. She is a sovereign nation and should give up begging with bated breath and whimpering humbleness in a foreign legislature for the restoration of her stolen liberties."

——The Belfast situation is complicated by the demand of the Royal Constabulary for increased pay on account of the extra work imposed upon them by the strike. The leader of the movement, Constable Barrett, was suspended from duty, but he addressed the meeting of 500 policemen and thousands of people, held to secure his reinstatement, and was then carried in a chair on the shoulders of a crowd thru the streets of Belfast. ——At the Parliamentary election for the Colne Valley division a young Socialist named Victor Grayson won by 3,648 votes to 3,495 for the Liberal and 3,227 for the Unionist candidates. Last year a Liberal was elected without opposition by 15,474 votes. Mr. Grayson was elected not as a labor member, but as a Socialist, with a very radical program, including the abolition of marriage.—— Last week the Harmsworth newspapers, the *Daily Mail* and the *Evening News*, paid $250,000 rather than await the judgment of the court in a libel suit brought against them by Lever Brothers, soapmakers, for accusing them of forming a trust for the monopoly of the soap business in England. A similar action brought against the papers this week by Joseph Watson & Sons, of Leeds, was settled in the same way by the publication of an apology and retraction and the payment of $250,000 or more in damages by the newspapers.

French Affairs

The generals at the head of the army are very indignant at the action of Parliament in making the two years' service law retroactive instead of applying first to the class of 1906. They believe it to be dangerous to the safety of the country, because for a third of every year for some time the army will be seriously weakened. Generals Hagron, Metzinger and Michal have resigned from the Supreme Council of War as a protest against this action, and it is rumored that other members of the Council have done the same, altho the Government is concealing the fact until their places can be filled by younger men. Major Alfred Dreyfus has sent in to Minister of War Picquart a request to be retired on half pay. The reason is believed to be that he is disappointed in not being promoted to the rank of lieutenant-colonel, which he would have reached if he had not been sentenced to Devil's Island. It will be remembered that General Picquart lost his position in

the army thru his defense of Dreyfus, but when the latter was vindicated a year ago he was reinstated with the rank of brigadier-general, and is now at the head of the War Department. Probably General Picquart feared to reopen the old bitter controversy by promoting Dreyfus.——A mutinous spirit still prevails in the French army. Three hundred members of the Fifty-third Regiment, indignant at being ordered to Perpignan, decided to return to their old barracks at Tarbes, but were dissuaded by their officers.——The representatives of the Viticulturist Association of the Midi resolved at a recent meeting to continue the struggle against the Government by a policy of passive resistance. One of the mayors of the South of France who took part in the recent strike of the municipal officers was tried for refusing to discharge an official duty, but the court acquitted him. Mgr. de Beauséjour, Bishop of Carcassonne, was fined $10 by a local court for violation of the law in performing the religious ceremony of marriage before the civil formalities had been fulfilled. Owing to the strike of the mayor the civil ceremony could not take place. His action marks the beginning of a movement on the part of the Catholics for complete freedom from State control in the matter of religious ceremony now that the State has ceased to recognize any cult.——Under the new law passed at the last sessions of the Chamber of Deputies married women in France are now entitled to their own earnings and all profits of the investment of the funds. They are not held responsible for their husband's debts unless these were contracted in the interests of the ménage.

Russian Disorders

The strike in the cotton mills in the vicinity of Moscow continues and is increasingly assuming a disorderly and political character. Forty thousand men are now out, and it is expected that other big mills will become involved. Many arrests have been made and the troops in dispersing revolutionary meetings have fired upon the people. The Seminovsky Regiment openly refused to take part in the maneuvers when the troops in camp at Tsarskoe-Selo were being reviewed by the Czar. A large quantity of revolutionary literature was found in their barracks. The object of the demonstration was to compel the retirement of General Reimer, who has just assumed command and was disliked by the troops because of the part he made them play in putting down the Moscow revolt with such terrible slaughter in 1905. General Min, Reimer's predecessor, was assassinated at Peterhof a year ago, and General Reimer, fearing a similar fate, fled to Alexandria, from which he has now returned to take charge of the regiment. ——Almost the only work of the last Duma was the abolition of the drumhead courts-martial, but the system has again been put into force in a more stringent form than before. Only seventy-two hours for appeal are permitted to elapse between indictment and execution, including the appeal of the Military Court of Cassation, whereas a fortnight was permitted under the old régime. The new military courts have jurisdiction in all provinces, not merely, as formerly, in those that were in a state of extraordinary defense. A number of summary executions have taken place in the week during which the new regulations have been in force.——The period for the registration of votes for the third Duma has expired, and very few of the voters have taken part in it. For example, in Odessa there were only 48 registrations out of 20,000 votes. Owners of real estate are not required to register.——The police report the discovery of a new plot to kill the Czar. Maps of the fortress at Kronstadt and of St. Peter and St. Paul at Petersburg, and the Tsarskoe-Selo and Peterhof palaces were discovered and an engineer was arrested as leader of the conspiracy.——The Constitutional Democrats will not be allowed to hold their congress in St. Petersburg. They will try to meet in Finland in September. The newspaper organs of the party have recently been fined heavily.

The Japanese in Korea

It seems that the Emperor of Korea did not regard his forced abdication as valid and binding on him, for he continued to incite plots against the Japanese and prevented his son from as-

suming the prerogatives of government. Another all-night siege by his Cabinet was necessary in order to secure from him a formal and distinct renunciation of the throne. The new Emperor thereafter consented to acknowledge the congratulations of the Emperor of Japan upon his accession and to sign State papers. The attempts made by the ex-Emperor and his friends to arouse the troops to mutiny and the populace to rioting were not successful, owing to the strict guard kept in the capital by the Japanese. The Korean Army repudiated entirely the pro-Japanese Minister of War and refused to obey his orders, but as the amount of ammunition they had was small and they were confined to their barracks they could not do anything. The electric light plant, the railways and the houses of foreign residents were protected by Japanese troops. In several parts of the Empire Japanese residents were attacked and buildings burned, but any concerted movement of opposition is apparently impossible on account of lack of patriotism and unity among Koreans. Six prominent Korean officers, including one of the Elder Statesmen and Pak Yongho, Minister of the Imperial Household, were arrested during the night for attempting to organize an insurrection against the Japanese and the new Emperor. The part which Pak Yongho has played in the recent crisis is very obscure and not understood even by those on the spot. He was exiled from Korea some ten years ago on account of conspiracy against the throne, but a few weeks ago he appeared in Korea, ostensibly brought back by a sudden and imperative desire to see his family. Altho he had not been pardoned, he was received graciously by the Emperor and courted by both parties. It was generally believed that he came back to head an anti-Japanese movement, but the Marquis Ito showed him great favor and he associated himself with the Il Chinghoi or Japanese party. At this a plot was formed under the Korean nationalists to assassinate him, and ten men pledged themselves to carry out the plot at a public meeting held in Seoul to welcome him home. Pak Yongho was apparently taken sick and went to the hospital instead of attending the reception. One of the conspirators, seeing that they had been foiled, committed suicide. A proclamation to the Koreans was found on his body, showing that it was the intention of the conspirators to make martyrs of themselves as an example of patriotism to their distressed countrymen. Pak Yongho mas made Minister of the Imperial Household with the approval of the Japanese, then removed, but reappointed by the young Emperor. They now seem to have found reason to distrust him, or have taken advantage of the crisis to crush him. A further step toward the annexation of Korea has been taken in the new agreement which was signed at the Japanese Residency at midnight on July 25th by Iwan-Yung, the Korean Premier. It contains the following provisions:

The Government of Japan and Korea, with a view to the early attainment of prosperity and strength in Korea and the speedy promotion of the welfare of the Korean people, have agreed upon and concluded the following stipulations:

Article I. The Government of Korea shall follow the directions of the Resident General in connection with the reform of the administration.

Art. II. Korea shall not enact any law or ordinance or carry out any administrative measure unless it has the previous approval of the Resident General.

Art. III. The judicial affairs of Korea shall be kept distinct from ordinary administrative affairs.

Art. IV. No appointment or dismissal of Korean officials of high grade shall be made without the consent of the Resident General.

Art. V. Korea shall appoint to official positions such Japanese as are recommended by the Resident General.

Art. VI. Korea shall not engage any foreigner without the consent of the Resident General.

The clause in the convention of three years ago providing for a Financial Advisor to the Korean Government is annulled, and Japanese will fill the more important administrative offices thruout the Empire directly instead of acting thru native incumbents as before. On account of the expense and the lack of qualified Japanese, the introduction of Japanese officials will take place gradually. Two members of the Korean delegation which have been appealing in vain to The Hague and European courts for protection against Japan have embarked for this country to present their claims to the President.

For a Better Understanding Between the East and the West

BY BARON KANEKO KENTARO

[Baron Kentaro is the ex-Minister of Agriculture and Commerce and a member of the House of Peers of Japan. During the Russo-Japanese War he was in the United States as the especial representative of Japan in addition to the Minister at Washington. He has received the degree of LL.D. from Harvard.—EDITOR.]

IN the troublesome path of bringing about a better understanding between the East and the West, there are two obstacles standing out with more emphasis than others: One the religious prejudices of different peoples and the other is what is known as the race problem. I have always looked upon the religious prejudices as perhaps the gravest barrier between the races of the East and the West. My eighteen months' stay in the United States, however, during the Russo-Japan war, gave me a new idea. I was happy enough to be admitted into intimate association with a large number of people of affairs in America who are leaders of thought, men of affairs commercially and otherwise.

My association with this class of Americans resulted in the conviction that, so far as the religious horizon of the people of the United States is concerned, it was very broad indeed. The consensus of opinions of religious circles of America is based upon the lofty and broad principles of charity, and is distinguished with tolerance surprising to the outsider.

In fact, I found that the prevailing sentiment of the religious American was strongly in favor of our country, not at all prejudiced against us because of creed, and what is more, in some cases, it was even decidedly prejudiced in our favor. Thus I had the pleasure of throwing away from my mind the fears that I had entertained for many years, arising from the difference of religious cults as a potent factor in wrecking the worthy efforts for the consummation of which all of us are longing—of bringing about as complete an understanding as possible between the East and the West.

On the other hand I discovered, I regret to say, a new difficulty, after all as grave as the religious prejudice. From year to year the misunderstandings which arise from the difference of blood gained their force, and at this time they have come to assume the serious proportions of an international menace.

In the United States, while the amalgamation of the Anglo-Saxon and the Teutonic races seems to have brought about a very happy result, the distance between these two races (I mean the Anglo-Saxon and the Teutonic races) and the Latin races seems to be not a whit closer than it was in the days of old. The fact has a pertinent significance to us, read in the light of these days, when the public opinion of the United States has begun to tell abroad. It has widened its influence over the seas, and with the growth of its prestige and actual sovereign power over the Hawaiian Islands and the Philippines it has come to wield a powerful influence in the domain of the Far East.

The same may be said of Great Britain, Germany and France. They are exceedingly active in extending their spheres of influence into Africa and the East, so are coming into close touch with alien races. The chancelleries of the great powers of the world today seem, in fact, to show a strong penchant in the occupation of the tropical domain. In their program of mastering tropical domains, however, they have changed tactics; they used to dispatch their religious teachers as a herald of their onset. Today they do not do so. In order to bring these barbarous or semi-civilized races under their influence, the great powers depend almost altogether on the military or money powers, or both. Their ambition is created with money and sword.

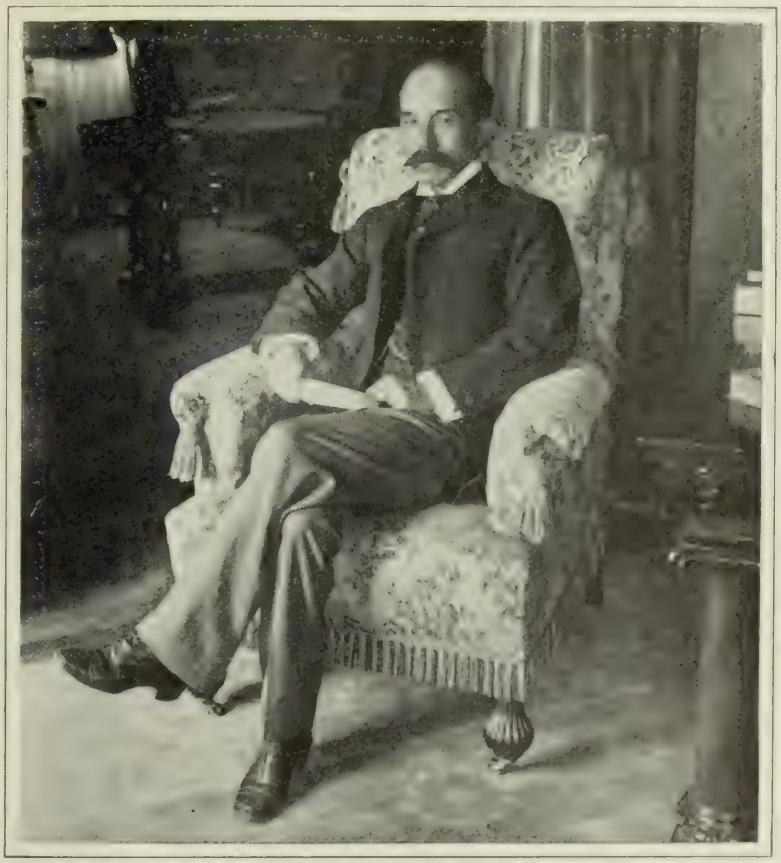
One of the serious problems which is engaging the energy and time of American and European men and scholars today is whether or not the European and American races can occupy African and Oriental territories in the tropics, and occupy them permanently, and as a corollary they are looking into the question as to whether the African and Oriental races can establish their own institutions, develop them to the level of those in the civilized states, and maintain themselves independently.

Not long ago a learned book was published. It was written by one of the students of international politics on the control of the tropics. It is surprising to note what a very wide attention among the statesmen and scholars of the West it claimed, an incident which goes far to show the extent and interest of the West in such matters. It was just at this point of time that the world saw the opening and progress of the Russo-Japan war. The war commented plainly on the ability and the spirit of the Nippon race in maintaining and defending its vested rights, and in the conduct of a great military campaign, and this it was that gave the Western powers a somewhat exaggerated dread of what it may be able to do. They have come to the conclusion, the chancelleries of the West, that here is one race at least in the Far East with all the necessary, and in fact more than necessary endowment in not only maintaining itself against all comers, but with the power and ambition of extending its domain and influence abroad; thoroughly competent to occupy the territories, not only in the Far East, but in the tropic regions. And this conviction was the father of a new emphasis which is now being put on the racial question throughout the world, bearing especially on the differences of the Western and Eastern races. So it came to pass that Europe, which of old used to tame the Far East thru their honeyed words of religious propaganda, has, all of a sudden, changed its tactics completely, and today is active in assuming a somewhat hostile attitude, which we see expressing itself thru many measures, either barring out the Far Eastern races from their own domain, or carrying out drastic measures in openly fighting their interests. This phase of the anti-Oriental movement on the part of the Western races is a matter which ought to claim our most serious attention.

While this anti-Oriental sentiment has been carefully fostered in attaining its surprising growth, it is plainly seen that the differences between the different countries of Europe and America are coming together into a common household, with more or less success, with more or less appreciation of each other. Indeed there are many prominent leaders of thought and politics both in Europe and America who are straining their efforts and marshaling their powerful influences, and bringing about a consummation of a better understanding between the European and American races.

Chief among these, according to the current reports of the day, are his Majesty the Kaiser and the President of the United States, Mr. Roosevelt. Germany has already created a chair at the Berlin University, and distinguished it with the name of the Roosevelt chair. She invited professors from the United States to come over and lecture to the German students on the conditions and events of the United States. The Columbia University of New York has dispatched one of its professors to fill this German chair created by the Kaiser, and his lectures are on the Constitution of the United States and the popular rights in America.

In response to the kindly initiative of the German Emperor, Columbia University has created the Kaiser Wilhelm chair. It invites a German scholar to fill it, in much the same manner as the German University invites an American professor. Professor Schumacher, of Bonn University, filled the chair and lectured in New York on commercial and industrial Germany, and the Americans who have had the pleasure of listening to him are loud in commending the special advantages which accrue from this series of lectures.



Now this exchange of scholarly men between the United States and Germany is an admirable effort to sweep away the somewhat unpleasant misunderstanding which has for many years clouded the prospect of bringing about a thoro understanding between the two peoples, and

there is no doubt but this will prove to be one of the most efficient measures to attain the end.

Italy lost no time in following this good example; at once she established in the city of Rome a chair for an American professor. Thru him Italy wishes to learn more intimately of the different affairs of the United States. At the same time the United States promptly returned the courtesy and showed her appreciation of this effort on the part of Italy, and went about creating chairs in different American universities for scholars and artists from Italy to instruct American students in Italian art and in the more modern developments of Italian civilization. Perhaps one of the reasons which induced Italy to take this measure of encouraging a more intimate friendship between herself and the United States was occasioned by the desire of nullifying the effect of an unfortunate misunderstanding which arose from an unhappy complication in New Orleans, where a certain number of Italians were murdered by Americans. The world knows how, at the time, the Italian Ambassador closed his Embassy in Washington and returned home. Ever since the friendly relation between the two countries has always been under a cloud, and this effort in establishing a sort of scholarly alliance between Italy and the United States is hoped to sweep away the last shadow, if such still remain, resulting from the unfortunate incident of many years ago, and thus call this scholarly *entente* to the assistance of diplomacy.

England followed suit: Mr. Moseley is the originator of what is known as the Moseley Educational Commission. Thru the liberality of this wealthy citizen of Great Britain, five hundred educators were dispatched to the United States from Great Britain for special investigation along commercial, industrial and educational lines. Mr. Moseley defrayed all expenses incurred by the commission, and the results seem to have produced more than the expected advantage.

This seems to me a golden hour. The leading powers of Europe and America are assiduous in bringing about this scholarly alliance between them. It is to be heartily hoped that our Imperial land may not fail to appreciate the significance of the opportunity which is facing her today. Nothing is more gracious and profitable than the exchange of ideas, of knowledge, of experiences; nothing would do quite as much in making our race closer to another as to enlighten it on the conditions of the other race. It is one of the pressing duties and necessities of the State. That, at least, is my conviction. It is highly important that many of the races' differences, so difficult to understand, and which are arising almost every day, should be thoroly investigated, and, if possible, explained and reconciled. Who shall say that such efforts as this should be neglected by one desirous of friendly relations among the powers. The time is here when the racial question is

BARON KANEKO KENTARO.

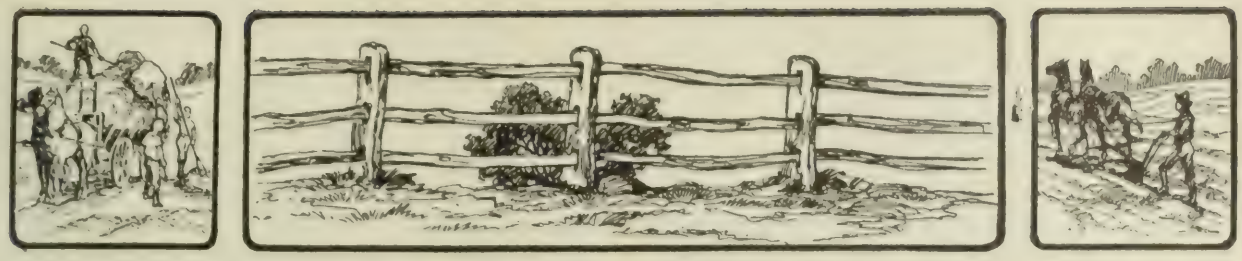
dictating the foreign policy of the great powers of the world. It is the racial question that is either to develop the friendly relation between the nations of the East and the West or utterly break it.

For that reason it is my opinion that we should follow the admirable example of America and Germany in the matter of scholarly understanding between the nations. By all means let us encourage a movement which should result in the exchange of lecturers between the universities of Europe and America on the one hand, and, on the other, those at home. Last year an English university invited Dr. Kiluchi to lecture upon the educational system of our country. Our universities ought to seize upon this opportunity at once, and should return the compliment by inviting a scholar from England to teach our countrymen of the institutions and condition of affairs in Great Britain.

This measure is doubly profitable: Our people can learn at first hand and from a competent authority the affairs of a foreign country in which we are interested, and at the same time we can take an effective step toward the establishment of an international friendship.

Indeed, we have with us in our midst Professor Ladd, from the Yale University. He came over to our country at his own initiative, and he is responding now to the invitation of a number of schools all over the country, lecturing to them on the educational development, systems and institutions in his country.

Such is exactly the work that I would hail with enthusiasm. His personal efforts are giving us an opening by which we may profit very largely. We should extend the sphere of his activity, we should enlarge the scope of the work so auspiciously begun by Professor Ladd.



Last year, at the time I was leaving the United States, Mr. Green, the secretary of Harvard University, wrote me and said that there was a movement afoot among Americans for creating a special chair to invite a scholar from Japan to lecture to Americans on the history of Japanese civilization, and especially on the transition and development of the political and social Japan of the modern date. If there be found among the people of Nippon those who are willing to endorse this movement and bear a portion of the expenditure in connection with such program, he suggested that Harvard University would at once establish such chair, supported by a joint contribution of both the American and Japanese friends, and thus create a friendly chair between Harvard University and Japan by constantly having in their midst a Japanese scholar filling the chair thus created. He asked me if I would not take an interest in this matter and do what I could for its success.

I have no doubt but that, if I may be happy enough to find a number of wealthy men in Nippon who are willing to share a portion of the expenditure connected with the creation and support of this chair, we may have the pleasure of seeing in Harvard University a chair devoted to the study of Japanese history and institutions.

The foreign nation, as I have pointed out, is anxious, on her own initiative, to know more about the history and present condition of our country. We cannot do less than return the compliment of this very kindly desire on the part of our friends, and on our part should at once take an active step in inaugurating such measures as would result in the establishment of a chair at our own university devoted to the study of the history, industry, education and other affairs of our neighbors, taught by scholars from abroad. Nothing in my judgment would be more gracious than this intellectual alliance. Nothing would untangle more effectively the sad knots of misunderstanding which are resulting from racial differences and racial prejudices. Nothing would work so well in smoothing a path of friendly relation between the nations as this move.

In short, I look upon today as a golden age, in which we may be permitted to bring about a scholarly alliance between the East and the West, which of necessity would inaugurate a better day of friendly relations between the powers.

TOKYO, JAPAN.

Agricultural Colleges and the People

BY E. P. POWELL

I HAD trouble with my tomato vines, and was told that I could find all the advice needed in the Bulletins of Cornell Experiment Station No. 32, Department of Agriculture Bulletin 76, New Jersey Experiment Station Bulletin 136, Iowa Experiment Station Bulletin 47, Alabama Experiment Station Bulletin 108. More detailed directions could be obtained from a book published by Dean Bailey, of New York State Agricultural College. While in Florida I desired to raise Smyrna figs, but was told I must first get the caprifig wasp, introduced into this country by the Department of Agriculture, and experimented with by the California College of Agriculture. My neighbor, Hodge, is a dairy farmer. I found him using the Babcock test, to determine the comparative value of his cows—the invention of a professor in the Agricultural College of Wisconsin. Desiring to build a silo, I was referred for instruction to bulletins from Wisconsin Experiment Station, and to others from Indiana and Oregon. So it turns out with every possible need of horticulture or agriculture, or what more exactly should be called aericulture. Recent bulletins discuss legumes, alfalfa, meats, farm drainage, irrigation, apple growing, peach growing, grape diseases, orange culture, sugar beets, forestry, poisonous plants, insecticides, country homes, marketing, all sorts of insect pests, spraying orchards and gardens, and otherwise enter into every field and branch of home life, home thrift, and national prosperity.

In every essential particular the experiment stations are a part of the agricultural colleges, and all of these constitute parts of a great system headed by the Agricultural Department at Washington. The stations are less pedagogical, but equally experimental with the colleges. There are over sixty, including those of Alaska and Hawaii; organized under the Hatch bill of 1857. With the establishment went fifteen thousand dollars a year to each station. The States have generously supplemented this, until the amount appropriated is annually close to two millions. The compensation has fully satisfied the people. Their bulletins reach almost one million homes. North Dakota claims that its station is worth "one hundred million a year to the State itself." The two stations in New York have done fully as much for the people in fighting pests and teaching scientific agriculture. I found the Florida station busy with legumes and storage, two problems vitally essential to the South. The value of the velvet bean and beggar plant in enriching the soil is something the Northerner does not understand. In a Western State there are over two thousand wheats being tested at a single station. Bear in mind that a wheat averaging fifty bushels to the acre must be created, for we are close up to the limit of exporting wheat.

The agricultural college was the dream of the veteran Senator and sage, Morrill, of Vermont. It was during the Civil War, in 1862, that his bill was enacted by Congress, granting thirty thousand acres of land to each Senator and Representative in whose State should be established a college, whose object should be to improve the agricultural methods of the State. The first created was in Michigan, which happened to be the first State also to establish a State classical university—about

fifty years earlier, in 1818. Michigan is a model American State. A peninsula among the Great Lakes, it has its own imperial resources, in the way of lumber, fruits, fish, salt, and a population which entitles it to be called the second New England. It was appropriate that the President of the United States should assist in commemorating the fiftieth anniversary of its agricultural college; a college which stands for a vast educational revolution. After the Michigan college, others followed in rapid succession; about half of them being adjuncts to State universities or classical colleges. The number now in attendance on these institutions is about six thousand. The graduates are double that number. The New York college reports approximately five hundred pupils.

The first impression created upon the public was unfavorable. In the first place it was not easy to get good teaching corps. Investigation had not been the habit of our colleges; science had been secondary. Their graduates held literary achievements as pre-eminent, and it is to the agricultural colleges that we owe a change of frontage to our whole educational system—a Baconian frontage. Such instructors as could be obtained knew little of original research, nor was there a vast volume of accumulated facts behind them. Agriculture was despised. Farming was out of joint. Deserted farms were annually advertised by several of our States. It is no wonder that at the outset 90 per cent. of the graduates of the agricultural colleges failed to devote themselves to agriculture. I confess that when I took up this topic I did not fully realize that the agricultural colleges had passed entirely by the experimental stage, and had not only created for themselves a most abundant and capable staff of teachers, but had injected the spirit of investigation into every school in the United States—in other words, had made the study of land-culture the very ideal. But I find the whole United States netted with a new and innovating system of education; an intolerant system so far as this, that it will have nothing to do with medievalism, while it bases itself strictly on industrialism—that is, the development of the industries of the State; to educate and ennoble labor; and to prepare its pupils not only to think, but to think in connection with modern affairs and everyday life. I find, farther, that our agricultural colleges are getting to be the intellectual centers of America. There is about them not only an atmosphere of investigation but of application. Had education become industrialized at an earlier date not only would much wasted power have been saved, but many of those who became eminent in philosophy or theology would have been eminent in practical science. Jonathan Edwards, when a boy of thirteen, without aid or advice, anticipated several of our modern scientific discoveries. Professor Silliman, of Yale, says that in a more favorable age Edwards would have become another Isaac Newton.

While it was not easy at the outset to man our agricultural colleges, we find that a new sort of scientific enthusiasts has been evolved—a sort of men desirous of nothing so much as to apply science in finding out things; and these practical scientists are making our agricultural colleges the most forceful institutions of learning ever instituted. The young men and women that flock to them are dead in earnest, and are never found in hazing and other occupations which disgrace our colleges. Ninety per cent. of the graduates now go into farm work or correlated industries. They are not drafted off into our cities, seeking employment in the crowd. The wave countryward, which has been going on for fifteen years, is largely due to these fellows. I know a young woman, member of a wealthy family, but with an enthusiasm for the land. She went to Cornell, while her mates went to Vassar and Wellesley. Today she is modernizing one of the largest women's clubs in the United States, while her summer is spent in the garden, orchard and hay field. This girl does not need to know one fact less about music, or French, or art, because she knows the exquisite art of orcharding and the high art that reaches from breeding cattle to cross-breeding fruits and flowers. She is a practical gardener, and there in the garden comes back to her, not only the lore but the health of her grandmothers. She has learned, not only to create with

God but to transmute her creations into wholesome food, and a wholesome personality. I am not sure but that the liberal education of women came about one generation too soon. Had there been a little delay, just long enough for industrialism to get its grip on life and thought, co-education would have created more home builders, housekeepers and garden makers. Horace would have had less influence with them, but Darwin would have had more.

CENTRAL BUILDING, COLLEGE OF AGRICULTURE, MADISON, WIS.

Agricultural education reaching out by its bulletins, lectures and orchard talks, not seldom adding reading courses for farmers' wives and farmers' children, is doing a great deal to break up the dead level of farm life, the insipidity of an industry from which the factory had taken the brightest and pleasantest occupations. For fifty years farm life could be described as

> "To nod with grazing cattle, where slow days,
> Most like the slow streams, creep in endless levels."

Once arcadian and idyllic, farming had become the treadmill of an unenlightened population, thinking of the distant city as a Paradise—but out of their reach. But this new sort of schools has touched every farm home to quicken it; has turned all the sciences loose in our orchards and gardens. It proposes not only to greatly increase the product of our land per acre, but to make our labor intensely interesting. Not all of this is due to the Agricultural College and its congeners, but vastly the larger part of the work has been done by these institutions. I think there are some evidences that, by carrying lectures and talks and reading courses into every hamlet, these extensions are going to displace the Chautauquas, as the Chautauquas supplanted the lyceum platform and lecture courses.

The economic problem is, however, just now the more striking, if not the most important. After the Civil War we found ourselves financially embarrassed; our needs increasing, but our productive capacity not increasing in the same ratio. We needed an enormous development of productive enterprise, and it was fortunate for us that just at that time the agricultural colleges were created. Along the line of evolution our present struggle is with the least significant forms of life. Our national entomologist, Dr. Howard, sets the annual

loss on cereals from insects alone at two hundred millions; on stored crops, one hundred millions; on forests and lumber, one hundred and fifty millions; on animal products, one hundred and seventy-five millions; on fruits, twenty-seven millions; on cotton, sixty millions; on hay and grass, fifty-three millions; and on all other products, about seventy millions. Homer is of great value to us, but he cannot help us in this pinch. Euclid alone could do nothing to stop the march of the Rocky Mountain locust. The wheat weevil, the hop louse, the codlin moth, the saw fly, the ox warble, the Texas cattle tick are facts that we cannot scan in hexameter. Education of the old sort had its mission, but it was incompetent to deal with the modern problem of subduing a continent to aggressive civilization. Agricultural education is reducing the annual losses steadily. We know now how to fight and how to conquer the currant worm, the curculio, the codlin moth, the pear psylla, the tent caterpillar; and altho the battle must be repeated each year we can save our crops.

Other lines of work are as novel as they are interesting; some of them inspirational. Professor Bolley, of North Dakota Agricultural College, has a nursery and hospital on the college grounds for curing the sick and strengthening the well, for sickness in the vegetable kingdom is quite as common as in the animal. He studies wilt, rust, smut and other diseases. His treatment of smut with formaldehyde has already saved millions of dollars to the State. His object, of course, is to seek a plant that will be immune, and at the same time he would discover a way to cure sick soil. Whenever a plant gives proof of its virility the seeds are preserved, labeled, and the next season planted to secure their posterity. He is working with wheat and flax as well as fruits, and it may be noted as a special feature of this sort of work that it requires probably ten years to secure a satisfactory result.

Recently Professor Hunter, of the entomological department of the Kansas State University, has turned his attention to the collection of parasite bees, to kill the green bugs that have caused such an excitement in the wheat market. These parasites are sent free of charge to the farmers of the Southwest. Reports from Texas and Oklahoma inform us that the bugs are practically exterminated from those States. In Kansas and Missouri the colleges are especially busy with the locust; the thirteen-year variety, which gave its last appearance in 1894, being due again this year. If they are able to accomplish relatively what Riley accomplished with the Rocky Mountain locust, it will be worth at least millions to the farmers. But for the strenuous labor of these collegiate corps, the San José scale would long ago have obliterated the horticulture of half the United States. At least a dozen colleges and as many more stations are at present co-operating with the National Entomological Department to destroy the terrapin scale.

Professor Holden's corn-gospel trains have become famous all thru the corn belt. He is accredited with having accomplished a reform which once more sends us into the millions for our estimates. These trains travel from town to town, at State expense, summon the farmers to a conversational lecture, and teach a scientific method of selecting the seed for cultivating our grandest cereal. Professor Budd, of the Iowa College, has ransacked the world for better fruits, and has introduced into the United States a very large number, either entirely novel to us, or improvements of those we already possessed. As an illustration of the result of his work and that of his able assistant, Professor Hansen, take the melon department alone. In 1898 thirty-five American and fifty-six of his Oriental sorts were tested at colleges and stations. The South Dakota College reported that the five best varieties were of the imported sorts. The Iowa State Horticultural Society decided that the winter melons were equal to the very best in quality, but that winter melons were not called for by the Iowa climate. The introduction of the olive has greatly added to our wealth as well as our pleasure. The commercial value of the orange, the melon, the strawberry, the tomato, as well as other fruits, and nuts has relied almost entirely upon the work of our professors. For instance, in New Jersey the station has been able to secure

an average gain of over sixteen hundred quarts per acre on irrigated plots of blackberries.

Taking up the problem of forestry, our agricultural schools show us how to make deserts over into arable land, and at the same time prevent the making of any more Saharas. A bulletin from the United States Department of Agriculture reports that our timber supply is melting away three times as fast as the increment of our forests supplies waste. The quantity of lumber annually used would make a floor, one inch thick, for all of Vermont, Massachusetts, Connecticut, Rhode Island and Delaware. On the other hand, if rightly managed, our forest area is sufficient to perpetually furnish timber enough for every legitimate need; in fact, as Professor Fernow says, it might yield a large annual income. The forests of the German States produce an annual net revenue of two dollars and forty cents per acre, and it is judged that our own forests should do considerably better. Canada anticipates a yearly revenue of thirty millions under her improved forestry system. Our agricultural educational institutions have not only agitated this question until most of the legislatures have been persuaded to act, but graduates from the forestry departments are in great demand to take charge of privately owned forests. I do not know of any one line of work likely to do more for the permanent prosperity of the American people than the exaltation of tree planting and the specification of such trees as will best thrive under local conditions. The State of New York commenced work in 1901 by planting white pine in the Catskill district. Its forestry work was for a while placed in charge of Cornell, but an unfortunate dispute ended this control, perhaps temporarily.

VIEW IN ONE OF THE STOCK LECTURE ROOMS, COLLEGE OF AGRICULTURE, MADISON, WIS.
Short course class receiving instruction on the form of the Dairy Cow.

Perhaps not least important has been the State soil surveys, carried on by a larger part of our agricultural colleges. Any farmer may have a specific soil examination by communicating with his State experiment station or college. In

this way a very large amount of labor is saved, in the way of cultivating crops least likely to produce a maximum revenue. Professor Miller, of Missouri, has been eminent in this sort of work, and he reports that the farmers of that State fall in with the idea very cordially. In Florida I found that Southern farmers were peculiarly in need of soil analysis, having in some way adopted prejudices against any effort to widen the list of crops experimented with. It is only within a very short time that the Irish potato has been one of their marketable products. The State bulletins have been eminently useful also in teaching the value of legumes, like velvet bean and cow peas, to make the sandy soil most fertile. A source of enormous loss to fruit growers has been the lack of accurate knowledge as to cold storage and shipping. The Department of Agriculture and the State colleges have taken up this question in all its varied shapes. California, which was losing more than half a million of dollars a year, reports that nearly all of this is now saved.

The work of Mr. Burbank has become so well known that he has been misplaced, if not misunderstood. He is simply one of the first to turn his homestead into a private experiment station. He is not only assisted by the United States Department of Agriculture, but he received his stimulus in the first place from agricultural colleges and stations. There are dozens more who are doing equally good work, altho not so extensive. Mr. Munson's grape catalog is one that might easily be issued from a State station, and he is author of bulletins on the subject of grapes, published by the Government. We seem to be coming to an era when our whole land will be covered with farms and farmers, who are also creators of new fruits and flowers as well as new races of animals. In other words, the agricultural colleges have established a sort of university extension, which has proved workable to an extent beyond that ever before scheduled. The object of these colleges is to reach the people, rather than to create a learned class, apart from the people. Every man who grows fruit or vegetables or flowers is interested in developing better sorts, while the boys and girls find the best part of their education in personal experiment and investigation. When anything new is produced it belongs to the world as well as the family, and the originator is expected to enter into correspondence with his agricultural college.

The Cornell Experiment Station is just now very busy over three or four problems that deeply concern plain farmers. Its experiments in root crops have developed mangels yielding eight thousand pounds of dry matter per acre, while the best yield of dent corn is four thousand pounds. It also has at present not less than fifteen thousand plants of timothy under observation, with the expectation of developing a timothy that will furnish three to four times the amount of hay per acre over the selections commonly grown. In the dairy school it has recently demonstrated that a high quality of butter can be made from the fat wasted in whey. The value of this butter in New York State alone would be annually over seven hundred thousand dollars. It is also paying especial attention to the invention of a better system of brooding chickens in large flocks; at the same time saving 75 per cent. of labor.

Not by any means least to be estimated is the profoundly good literature which we owe to these colleges. I do not know where to find volumes more attractive in their makeup, more charming in their literary style, more fascinating in their narrative, more educative in every way, than a volume of the "Nature Study Leaflets," published by the New York Agricultural College workers. Of all the "manuals of horticulture," not one ever published equals that issuing from the Iowa Agricultural College, and written by Professor Budd, and his colleague, Hanson. Of course the "Cyclopedia of Horticulture," published by Dean Bailey, is absolutely invaluable; and only for his relation to the agricultural college, we should know very little of Munson's masterly work with our native grapes.

Summed up, we find that the Department of Agriculture is so correlated with State colleges, and these with State experiment stations, as to constitute a new American university system. It has put

medievalism to shame. It has asserted the simple life as the true end of education. It is recreating the country home as ideal. It has gathered fruits, cereals, vegetables and flowers from all the globe, with which to create the country garden, yet it teaches the intelligent owner to improve what he receives. By the art of making soil from the air the land owner may hereafter reap his acres but never rob them. The property held by the agricultural colleges alone is over seventy millions, and a people never had a better investment. The problem now is a more perfect elaboration of studies, and how best to extend the system to the secondary and primary school grades. Most of the colleges require a preparation in English history, simpler mathematics and civil government. Massachusetts adds psychology, physical geography and plane geometry—much more than Yale and Harvard required one hundred years ago. Electives are allowed to some extent, and specialization between agronomy, dairying, animal husbandry and horticulture. A few of the colleges allow as high as sixty electives, based, however, on a prescribed course. Cornell has eight groups of electives, and it is doing very much in the way of reaching those unable to leave home for an extended period. A few of the States have created agricultural high schools. Alabama has nine, that is one in each Congressional district. In Missouri the normal schools teach agriculture to teachers. A few of the States graft agricultural teaching onto the common school curriculum, while Reading Courses and Farmers' Institutes constitute supplements in Michigan, New York, South Dakota and West Virginia. Maine, Minnesota, Oklahoma, Nebraska, Rhode Island and Washington add to their regular course high schools.

CLINTON, N. Y.

The Merchant Weighs His Merchandise

BY DORA READ GOODALE

STRANGE, glittering gifts, when all was strange and new,
Life with indulgent smile spread out to view;
Toys, weapons, tools. With leaping heart I chose,
Here, there; for beauty, these, for service, those;
Grasped unnamed wealth—"Ah! ah!"—with courteous ease
Life's hand restrained me—"First, my payment, please!"

"What, payment! I? Wherewith should I requite?
Fierce cravings tell me these are mine by right.
Be generous! Give!" Lips pursed, and narrowed eyes,
The mighty huckster scanned his merchandise.
"Something on trust I might perchance supply,
Yet days of reckoning come—and rates are high!"

"But I—I ask so little, stand so needy!
See—this, and this—what! folding them already?
A trifle, now, must serve." "Both small and great,
All in my pack is paid for, soon or late.
With toil and sweat, men yield me up the price,
With pangs and groans, with risks and sacrifice—
Soul's coin, or body's. 'Take my all!' you cry?
All's yours. You shrink? Farewell!" And Life passed by.

REDDING, CONN.

A Plea for the Needy, Mediocre Student

BY SUSANNE WILCOX

For some years I have been located in a college town where many of the citizens take a vital interest in the life of the students, who average about fifteen hundred young men and women each year. Being one of the interested citizens, I have had ample opportunity to participate personally in this life and observe its various phases.

Like most Americans I have been an enthusiast for education, and without stopping to define definitely this term, so flexible in meaning, to me it has always stood unquestionably for the medium of acquiring the maximum of power in the larger sense. Indeed so abiding was this faith in the wonders which education could work for the young man or woman starting life that it seemed to me no sacrifice made to obtain it could be too great. Not until after prolonged and disappointing observation among college students did this conviction gradually become infected with doubt, which caused me to question whether the price paid is not often too dear, or whether among the many other avenues of philanthropy, a way might not be devised for assisting the average young man or woman who is ambitious and persistent, and must earn all or most of a livelihood while going to college. For the exceptionally capable student there are always prizes or scholarships to be had, and with little difficulty he succeeds in enlisting the sympathy and interest of some one who is glad to assist him. The great mass of needy, mediocre students, however, often men or women of fine taste and feeling, pick their way from one wabbling stepping-stone to another, with only success flickering dimly in the distance as a beacon light to lure them on. It is after watching the struggles of this class of students that one's faith in the pre-eminent value of an education which requires the sacrifice of health, the most primitive comforts of life, and reasonable peace of mind, becomes shattered, and one's heartstrings are often strained to their utmost tension.

The first case among this class of students which came to my notice was that of a young man who heard that we needed some one to do sweeping and cleaning. He had only several hours free on two days of each week, so we employed him for all his spare time. He was a bright-eyed, moderately healthy and intelligent-looking boy, not ashamed to work, and so full of enthusiasm that the way looked easy. One day I came into a room where he was dusting and noticed that as I entered he was startled and opened his eyes drowsily, as if he had been dozing erect.

"I am afraid you are not getting enough sleep, Mr. G——," I said.

"Not any too much, I dare say," he replied.

"How many hours last night, for instance?"

"Four," he said, hesitatingly, for once before I had reproached him for stealing from the hours which he needed for rest.

"Would you mind telling me just how much work you are doing each week?" I persisted.

"Well, I go four times a day before each meal and in the evening to attend to Dr. Rainer's furnace; then I wait on table at Mrs. Steel's for my board, room and light. I have a place now in the library as assistant two hours each afternoon, which pays most of my tuition; besides three hours a day to attend classes,

which, along with your work, leaves me no time during the day for study. In fact, I have been putting off asking you to let me get you some one else."

Frequently during the year I saw Mr. G—— in the library. He always seemed hopeful, and insisted that he was getting on very well, altho each time he looked more hollow-eyed and fatigued. The following autumn he returned to college after having worked all summer on a farm. Various people who were interested in the lad began to be anxious about him and predicted that he could not hold out. Shortly after Christmas he was sent home to recuperate, ill and completely broken down.

A similar case was that of Miss T——, an ambitious girl, from a neighboring village, whose father was able to pay only her tuition. She went into the family of one of the instructors to work three hours a day for her board and room. There were books, some clothing and incidentals which were not yet provided for, so she asked if she might do ironing, mending, etc., in order to earn some extra money. Her first year's work in college was above the average, consequently she was permitted to carry five hours a week extra. At the end of the second year she looked faded and worn, and all her freshness and buoyant spirits had vanished. During the second term of the third year she was forced to give up and return home, a very young woman with youth and health gone.

Another case was that of a young man whom every one knew. He managed a boarding club, did typewriting and played for dancing parties several evenings a week. People said: "Mr. W—— is a wonder; he is a good student and supports himself and his widowed mother while he is getting his education." The third year of his course he did not return to college, and when his friends wrote to inquire why he replied: "I've given it up, boys, and I'm afraid I must confess that I have been beaten at the game. I'm going West now to work and hope to pick up a little health and get back some of my grit."

These examples, however, do not come within the category of the most dispiriting ones. By a little prudence and moderation these young people might have reached their goal unharmed, or at least only slightly disqualified. Among the worst and not unusual cases is the man, often an ambitious country school teacher, who has plodded industriously ahead trying to prepare for college until he has reached maturity. Suddenly he finds that his interests have concentrated in an attractive country girl, whom he marries in spite of his ambition. In time she too becomes inspired with the idea of having her husband go to college. The prize for him at the end is a high school position paying perhaps a hundred dollars a month, and for her comfortable living in a town and social elevation much above that of those among whom she was reared. In time education becomes for this earnest couple the golden gate at the entrance to an earthly paradise, and until it is gained they agree that no sacrifice must be too great, and every difficulty must be surmounted.

The man's immediate earning capacity is small and his talents perhaps very limited. The woman's part is to work in the house, devise ways of economic living, and to save all she can from the meager earnings. At the end of a few years they have laid by several hundred dollars. In the meantime a child or two has been added to the family, who do much to brighten the way, but they, too, must be fed and clothed, and have kept down the economics considerably. But the time has come when this couple feel that they are ready to make the long contemplated step. The woman now works almost without ceasing, giving a deft touch to her plain worn clothes and getting all things in readiness. Then they go to the college town. Rents are high and provisions dear, but after much searching about they find a cheap cottage in the suburbs among the poorest classes, and settle down hopeful and undaunted. During the opening days of college the husband comes home buoyant with his new experiences; the professors are very agreeable and the students are glad to give him information or direct him about. A notice is posted in the library announcing that an eminent musician will play the great organ on Sunday. All are invited and they will go. After the first few days the lessons begin to be longer

and loom up very formidably to this man who has had inferior preparatory training. A long theme to be written daily, several chapters of psychology, fifty pages a day in history. Can he ever forge thru so much he begins to wonder? And soon he discovers that the bright, hustling town boy accomplishes easily and with good results what he does only poorly and with infinite pains. But this he does not reveal to the little woman who believes him to have no peer.

Several times they go to hear the great organ, and such an awakening to the woman whose life heretofore has run tranquilly in a very narrow groove. The first time she is so overwhelmed with the flood of music that she is wholly unconscious of the details of her surroundings. The second time, however, she takes stock of all about her, and becomes bitterly conscious that she is plain and shabbily dressed, and, after a week of conflict with herself, she decides that she will not take the chance of shadowing her husband's prospects by appearing with him so noticeably again, and the following Sunday she deftly makes excuses about the children and goes no more.

At the end of the year the husband finds that he has failed in one study—he never could get fifty pages of history a day—and he has barely passed in his other courses. Then he and the brave wife openly face their problem, and begin to devise subtler methods of economy or study the art of existing just next the border-line of starvation. He then reduces his college hours and works during the summer months. She has already procured a little sewing or does cooking for the Woman's Exchange; or, if she be yet more enterprising, she proposes hazarding the remainder of their little hoard on a larger house and furnishings in a more desirable quarter, to accommodate boarders or roomers. From this point on there are various ways leading to diverse ends. I have known a long siege of illness or the death of a child to swallow up all the economies at one blow, and the disappointed couple have been forced to abandon hope and return to the country school or the farm.

I once heard of a couple who had a fourth of an acre of ground attached to the shanty in which they lived. They decided to sow the whole plot in turnips, and on this produce and a little cornmeal they hoped to be able to subsist during the winter.

Others less thrifty and courageous lapse into utter poverty and squalor. In one family of which I knew, the dishpan for want of other utensils, served as cooking pot, wash-basin, scrubbing pail and bath and wash tub.

Often, however, affairs go easier, as in the case of the woman taking boarders, and the more fickle husband begins to look well-groomed and dapper. He is all too readily persuaded that he must dress well and that the personal appearance of the wife and children is not so important. Then the observer begins to wonder whether this man to whom clothes are so significant a factor is not often embarassed by the wife who has begun to look worn and faded and whose clothes are shabby and antiquated. More frequently these material dissimilarities do not creep in. Both face the world frankly and make no pretences beyond honest impecuniosity, and they struggle on together for years. Eventually the husband reaches his goal and climbs even higher than he had originally aspired—but in the meantime subtler disparities have become manifest. There is a little intellectual rift which at first seems unimportant and is easily bridged over by the common ties of family, domesticity, etc., but little by little the gap widens until it can no longer be spanned; their outlook upon life and all its institutions is no more the same. The woman has been left behind in the race, and if she too have intelligence and be aspiring, she is most painfully alive to the situation.

A few years ago I became much interested in a thrifty ambitious and refined little housewife, who seemed bright above the average. Her husband was thoro and substantial but his mental equipment very mediocre. The wife did her housework, sewing, washing and ironing, and assisted her two children with their school and music lessons. One morning I chanced to meet her and noticed that she looked very tired, and accused her of overworking; whereupon she proudly confessed to me that she was getting up every morning at four o'clock

so as to find time to prepare a French lesson each day. She was doing the same work which her husband did in a French course in college. Knowing how long and tedious a task learning a language is ,and being curious to know why this ambitious little woman had selected this above all other studies, I asked: "But, why are you so anxious to study French?" After a moment's reflection she bowed her head and her lips began to quiver as she hesitatingly replied: "You see, I too would like *so* to be educated."

The more pushing and superficial women often make places for themselves in the various women's clubs and there study diligently about the Ramses and Tahutmes (ancient Egyptian kings), and thus easily persuade themselves that they too are being educated.

Perhaps the most striking case which has come within my observation is that of a couple who for years strove together until the husband became a professor in a great university and won national recognition in his subject. The wife at thirty-five was bent and showed the marks of much deprivation and hard physical labor. I have been told that in her strenuous days for several years she scarcely took a vacation from the labor in her kitchen as she cooked for a large boarding club; also that she went at times in winter with her feet only partially shod in order that her husband and children might be warmly clad. Today she has a sort of tolerated access to the society in which her husband has placed her, but she is always conspicuously ill at ease and awkward. Nevertheless she is a stoic and makes the best of her situation and no pretenses beyond what she actually is. Her husband is kind and courteous to her and buys her books which he thinks will amuse her, altho they are of the sort which he himself would not deign to read. In fact he denies her nothing which might contribute to her physical comfort, but in what concerns his outlook on the larger questions of life, his beliefs, etc., there is neither understanding on her part nor sympathy between them. Many wonder at this incongruous couple and pity this eminent professor because he has been so unfortunately mated, but no one is more keenly conscious of the fact that she is a social misfit than this wife herself. One day, in a little heart to heart talk with her, she chanced to speak of education and in an unguarded moment she slipped out from her usual guarded stoicism and said: "I'm sure education is all right for some people and in some walks of life, but I often wish that no one belonging to me had gone beyond the farm."

And so, in following the careers of this class of students, one often sees the health and hope of youth vanish; individuals, as in the case of many earnest young wives, sacrificed, so to speak, upon the altar of their golden image—education; men entering life weary and embittered after prolonged grappling for a little learning and a bare physical existence, who plunge readily into the pitfalls of modern commercialism, abandoning all ideals and retaining only success—and no matter what kind or how attained—as the ultimate goal. And after these experiences repeat themselves one begins to wonder whether dipping into the ologies and isms of a college course, attended with such an enervating expenditure of effort and spirit, often brings approximate rewards.

One is readily convinced that the weaker ones had better remain upon the farm, and for the more capable and persistent, who have the making of most excellent citizens, one wishes the way might be made less difficult so the burdens do not crush out all hope before life is actually begun or tempt the jaded spirit to give himself over to mammon.

In this day of genial and generous philanthropy, is this not a much neglected field? Could any work be more commendable than to assist earnest men and women who lack the stature to pick the free-for-all plums which hang only on the highest branches? Much has been done for the exceptionally gifted, but they comprise only the smallest fractional part of the great mass, and are by no means always the best human types because of their talents.

"The Loan Fund" at Harvard, where men of average ability can procure small sums and repay them when and only if they wish, is one of the few institutions established on this basis, and ought to be the forerunner of many. Nor should the ambitious fellow be shut out who has

dared to yield to the instincts of nature and taken to himself a wife before he has gotten his equipment. I am told that it is more easy for the rich man to enter the kingdom of heaven than for a married student—no matter how great his talents—to obtain material assistance at any of our American institutions of learning.

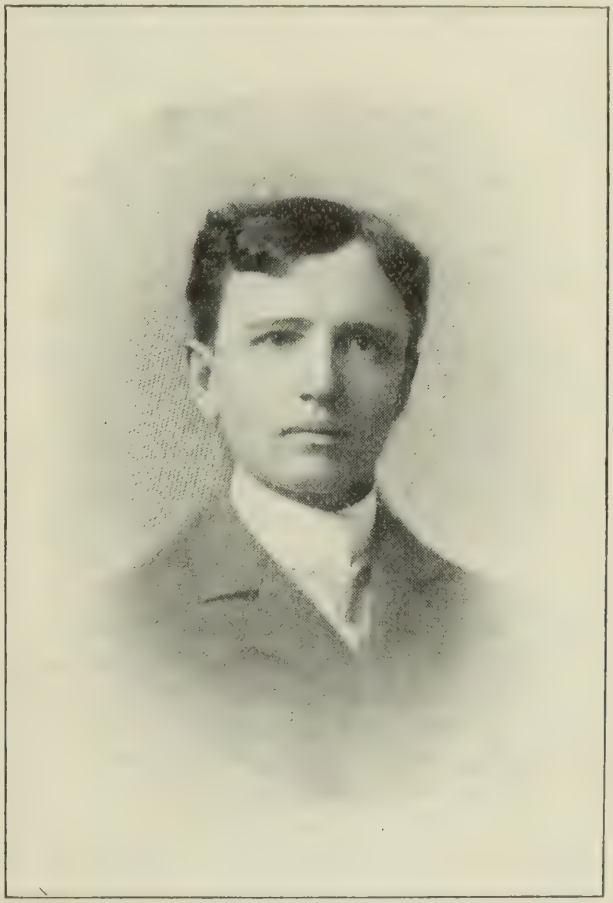
But it is difficult to enlist sympathy for the mediocre man. If one can say, "Here is a bright sparkling fellow who is poor," the attention of the listener immediately becomes focused. It may be necessary to add that the young man seems to have various reprehensible qualities, but it rarely diminishes the interest in him. On the other hand, one may say: "Jones is only an average student, but a fine fellow, and needs assistance," and there is little or no response from the listener. It is therefore with faint heart that one attempts a plea for the average man, for the philanthropist has generally pinned his faith to the literal interpretation of the text "to him that hath shall be given, and from him that hath not shall be taken that which he already hath," and the sociologist is invariably wedded to the doctrine of "the survival of the fittest" and all that it implies. Surely, however, not all the good red blood runs in such veins. There are still big men and women who have subtler and more human ways of working out life's problems, and the methods of assisting the needy mediocre student is one with which little has been done, and much of great value and importance can, and, let us hope, will be accomplished.

Public Ownership and the Civic Federation

BY JOHN R. COMMONS

[Professor Commons, of the University of Wisconsin, was a leading and active member of the Civic Federation that went to Europe, and was the author of one of the reports favoring municipal ownership.—EDITOR.]

THE municipal ownership movement is primarily a protest against the influence of public service corporations in politics.



It is not so much a business proposition as it is a policy of municipal reform. At the same time, if municipal ownership cannot stand business tests it cannot be supported as an effective reform. On this issue the National Civic Federation was able to induce public service corporations and municipal ownership advocates to join in an investigation of the facts. An interesting outcome ensued. The experts employed by the commission were able for the most part to agree on the facts. The commission was unable to agree on a summary of the facts, but did agree on recommendations based on the facts. In other words, particular items of fact can with patience and expense be fastened down and established, but the significance and relative importance of those facts are matters of opinion and self-interest, while a compromise program for the future can be outlined that will place both sets of facts and opinions on an equality for comparative experiment.

I do not know of any investigation ever conducted, either by government or by private endowment, that was so representative, competent and studious in its personnel as this one. Private corporations were able to bring out all essential facts thru the leadership of Mr. Walton Clark, of the United Gas Improvement Company of Philadelphia; Mr. Charles L. Edgar, president of the Edison Illuminating Company of Boston, and Mr. W. J. Clark, foreign sales agent of the General Electric Company. Municipal ownership was equally well cared for by Prof. E. W. Bemis, superin-

tendent of the Cleveland Water Work; Mr. Milo R. Maltbie, former editor of *Municipal Affairs,* and Prof. Frank Parsons, president of the National Public Ownership League. Trade unions whose members are employed by municipalities and public service corporations were represented by their international presidents, and labor in general was represented by Mr. J. W. Sullivan, of the typographical union. The general public might be said to have been represented by men like Prof. Frank Goodnow, of Columbia University; Dr. Albert Shaw, of the *Review of Reviews;* Mr. Talcott Williams, of the Philadelphia *Record,* and Mr. Walter Fisher, traction counsel to the Mayor and Municipal Council of Chicago.

The commission decided to make a thoro examination of a small number of municipal and private undertakings—such an examination indeed as an intending purchaser would make. For this reason it was necessary to employ engineers and accountants. At first it was thought that one engineer for each kind of utility and one accountant for all utilities would be enough. But when it came to looking over the field it was felt by the municipal ownership leaders that this would result in the employment of experts in the service of private corporations. The integrity of the National Civic Federation in promoting the investigation is shown by the fact that thereupon it doubled the appropriation and enabled the commission to employ two sets of experts satisfactory to the two sides of the question. The reports of these experts occupy two of the three volumes to be published by the Federation, and they furnish a mass of detailed information of the greatest value to all serious students of the subject. In addition to the engineers and accountants, certain members of the commission, Messrs. Maltbie, Sullivan, Prof. John H. Gray, of Northwestern University, and the writer of this article, were engaged to investigate the legal, historical, political and labor aspects of each undertaking. Their exhaustive reports are printed in the two volumes with those of the other experts.

The selection of the localities and undertakings to be investigated was a matter of much discussion. Naturally each side would select the best examples to prove its case. Consequently the report may be taken as the best that either can offer. This worked to the disadvantage of municipal ownership in America, because water works is the only public utility operated by enough municipalities to afford a field for selection. Street cars were not investigated at all in this country, because there are no municipal undertakings to compare with those of pri-

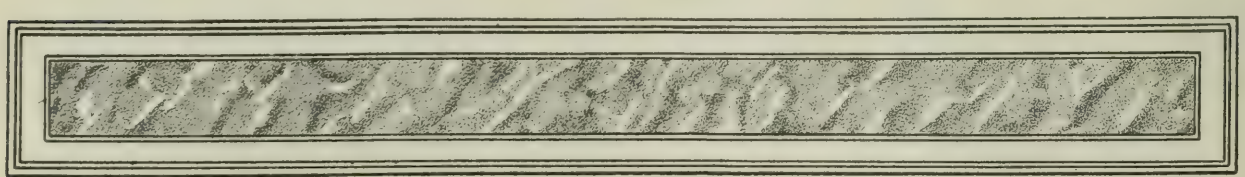
JOHN R. COMMONS.

vate corporations. There are only a few municipal gas properties, and of the thousand municipal electricity plants the large ones are confined to street lighting.

The American investigation was also deficient in the field of private companies. The companies took the ground that the public was concerned only with their charges and the quality of their service, and refused to permit the engineers and accountants to value their property and examine their books. Under these limitations the investigation of both municipal and private ownership in America is rather a suggestion of what needs

to be done than a report on what is doing.

The report on British undertakings is much more satisfactory. Physical valuations were made by the engineers of municipal and private gas, electricity and street car properties, and the accounts of both were carefully analyzed. Water works were omitted because American cities furnished enough municipal examples. Astonishing results were found. Gas is sold at 33 cents to 60 cents per thousand cubic feet, by private and municipal management, and one gas company has nearly $4,000,000 of physical property in excess of its capitalization. In other cases the capitalization somewhat exceeded the property. Whatever may be said of British industrial decadence in general, the gas business does not show it. Indeed, both municipal and private undertakings are almost too enterprising for the level of wages. Expensive machinery has been installed to displace labor where American managers would hesitate to displace it if they could get it as cheap. There is keen rivalry between municipal and private undertakings and the municipal ownership movement has served to stimulate and improve private operation.



The gas business in Great Britain furnishes the best opportunity for comparison because municipal ownership has been longest practised, and the regulation of private companies has been brought to the highest state of perfection. The electricity and tramway undertakings are more recent and legislation is less favorable to the private companies.

In summarizing the work of the experts, the commission found itself after prolonged effort unable to agree and consequently each side was permitted to make its own summary. These comprise the third and most readable volume of the report. The public is left to draw its own conclusions.

In the matter of recommendations a partial agreement was secured. Taking together the lessons of the several British undertakings investigated, the commission reaches the conclusion that American cities should have complete home rule and borrowing powers adequate to engage in municipal ownership if they choose to do so; but that the prospect of success depends so much on local conditions that a general endorsement of municipal ownership cannot be entertained. The presumption is in favor of private ownership, but this must be regulated so as to prevent fictitious capitalization. Uniform accounts should be kept by municipal and private managers, prescribed by State authority. The accounts of municipal undertakings should be separated from the other municipal accounts, and the management should be concentrated in a single responsible head.

Of course, these recommendations are the result of compromise and concessions. They do not present a consistent scheme and no individual is satisfied with all of them as they stand. Personally I think they omit the principal lesson taught by the investigation, namely the importance of having a physical valuation of the property as a starting point for regulation and publicity. They also omit reference to the regulation of rates and services, and they dodge the question as to regulation thru municipal commissions or a State commission. Indeed the commission was not appointed to make recommendations, and this part of the report is of minor value compared with the mass of facts and the summaries. Neither municipal ownership advocates nor private companies can get satisfaction from the report of the commission as a whole. But the serious student or legislator desiring to deal fairly with all interests involved will find in the report a greater amount of assistance to his efforts than he can find in any other publication.

University of Wisconsin.

The Instinct to Eat

BY IRVING FISHER, Ph.D.

[The author of the following article holds the chair of Political Economy at Yale, and is doing much to settle the old question of whether sociology is a science by making it a science thru the introduction of the lacking elements of mathematical methods and laboratory experimentation. Recently he has been absorbed in the subject of experimental dietetics on the lines advocated by Mr. Fletcher.—EDITOR.]

A GREAT deal of interest has been aroused during the last few years by Mr. Horace Fletcher, in a new method of eating. And yet the method is new only in the sense of being a revival. What is now called "Fletcherizing" is simply thoro mastication combined with an obedience to the instinct of taste. As is well known, Gladstone attributed his good health largely to the fact that he tried to take thirty-two chews to each morsel of food. Another prominent man, Brillat-Savarin, a Frenchman who lived during the Reign of Terror, wrote a book on "The Science of Good Living," the principles of which are practically identical with those of Mr. Fletcher's "A.B-Z of Our Own Nutrition," and the "New Glutton or Epicure." The following are some quotations from Brillat-Savarin:

"The tongue plays an important part in the action of tasting, since it is by it that food is moistened, turned about and swallowed. . . . Before we can taste solid bodies they must be comminuted by the teeth, impregnated with the saliva and pressed against the palate by the tongue till the juice so yielded makes a favorable impression upon the gustatory papillae, and the tituated body receives from them the passport necessary to enter the stomach. . . . Smell and taste form only one sense, having the mouth as laboratory, with the nose for fireplace or chimney. The one serves to taste solids, the other gases. . . .

"Of all the senses in their natural state, taste procures us the greatest number of enjoyments. First, because the pleasure of eating, when taken in moderation, is the only one not followed by fatigue; because it must return every day; because it can combine with all our other pleasures or even console us in their absence; because we have a certain special but indefinable satisfaction arising from the knowledge that in satisfying it we are making good our losses and prolonging our existence. . . .

"The human body would speedily become useless had not Providence placed within it a force to give warning when its powers and its wants are unequally balanced. This monitor is the appetite. When it is aroused the memory recalls things which please the taste; the imagination seems actually to see them. All the digestive powers are in arms, like soldiers ready for action, waiting only for the word of command. . . .

"There are some who eat without discrimination; without having received from heaven the sacred fire, they look upon dining as a mere task. They put all kinds of food on the same level. . . .

"The great majority of us eat and drink too much, and enormous quantities of eatables are daily absorbed unnecessarily. The result is either corpulence or indigestion."

It would be difficult to summarize better in a few words the teachings of sound dietetics from a practical point of view than in the quotations given and others which might be made from the interesting translations of Brillat-Savarin's work.*

Back of Brillat-Savarin other precursors of modern dietetics could be found, such as Coronaro, the Venetian centenarian of the sixteenth century. In fact, the art of eating is as old as the human race. In a sense it is a lost art today, except as it is being revived by Mr. Fletcher and modern physiologists. That food-bolting is unnatural few will deny. It is a matter of common observation that the habit comes from the pressure of engagements or the desire to catch a train. We have learned to eat against time. Hence our quick-lunch counters, and hence also the use of food preparations which can be swallowed quickly without need of much chewing.

A few years ago a physician bought a monkey in order to study his methods of eating. He fed him cherries, which the monkey seemed greedily to swallow whole. But after the stock of cherries was exhausted, it was found that the monkey had merely stored them in his cheeks. He had taken them as rapidly as possible, for fear, apparently, he

*GASTRONOMY AS A FINE ART, OR THE SCIENCE OF GOOD LIVING. London: Chatto & Windus, 1889.

should loose his chance of getting them all.

As soon as he perceived that no more were forthcoming, he began, from the little storehouse on each side of his mouth, to press with his finger one cherry after another into his mouth. He then chewed it thoroly, put out the pit, skin and stem and swallowed.

Among the consequences of food-bolting we must probably count the excessive use of flesh foods. Meat is one of the few foods which can be eaten rapidly with impunity. It requires less subdivision and less mixture with saliva than other foods. It is significant that the flesh-eating animals, such as the dog, lion and tiger, are rapid eaters, whereas the grain-eating animals, such as the horse, are slow eaters. Those who, like Mr. Fletcher, have overcome the common hurry habit and have reverted to thoro mastication, have found themselves unconsciously diminishing their consumption of foods, like meat, which are proper to fast-eating animals, and substituting foods like cereals, which are proper to slow-eating animals. A man who eats as fast as a dog or a lion will want to eat the foods which dogs or lions use. A man who eats slowly will find a cereal, fruit and nut diet more satisfactory.

When Mr. Fletcher first visited Yale University four years ago, the fact about his diet which most struck Professor Chittenden was the practical absence of meat and of other nitrogenous or "proteid" foods. Proteid is that element in our food which builds tissue. The other food elements—fat, starch and sugar—are useful to supply heat and energy, but cannot be used to make muscle, bone or sinew. In other words, proteid is for *repairs,* and the other elements, fat, starch and sugar, are for *fuel.* It follows that proteid food is absolutely indispensable to life, for if tissue is not repaired death will ultimately ensue. Physiologists have known this fact for a long time, and in consquence have always advocated a liberal use of proteid foods. In this, however, they were in error—at least if we may pin our faith to the modern researches of Chittenden, Folin and others, which are now being accepted by physiologists. Examination showed that Mr. Fletcher was using about half the proteid formerly considered necessary. He had reduced his proteid, not in accordance with any theory, but purely as a result of his system of thoro mastication and obedience to appetite. Since then Professor Chittenden, by his experiments on United States soldiers and Yale athletes and professors, has shown by actual laboratory tests that the amount of proteid ordinarily consumed in the American diet is at least twice as much as is necessary to maintain "nitrogenous equilibrium."

Two years later, in 1906, nine Yale students under my direction experimented with Mr. Fletcher's method of instinctive eating. Careful records were taken of the amounts of foods consumed and the proportions of proteid, fat and carbohydrate (starch and sugar) used. In order to avoid the annoyance of weighing the food at the table it was all weighed in the kitchen and served in definite portions of known food value. From these records the proportions of proteid, fat and carbohydrate were worked out by means of a "Mechanical Diet Indicator," which I have described in *The American Journal of Physiology* and *The Journal of the American Medical Association.* Records were made for each man and each day during the five months of the experiment. It was found that the proteid element was gradually and unconsciously reduced. During the second half of the experiment this reduction was somewhat accelerated by suggesting to the men that when appetite was in doubt they should give the benefit of that doubt to low proteid non-flesh foods; but the men were never encouraged to choose any food when their instinct definitely preferred another.

The main lesson from the experiment, however, was that the men improved in health and physical endurance. By actual gymnasium tests it was found that the physical endurance of the men was approximately doubled in five months. It would not be feasible here to detail the evidence by which this result was shown. It is given in full elsewhere.* Only one of the men failed to improve in endurance, and this exception proved the rule, for he was the only one of the nine who was not thoro in his practice of mastication, nor did he, in conse-

*Transactions of Connecticut Academy of Arts and Sciences, May, 1907.

quence, reduce his flesh foods as much as did the other experimenters. The majority of the men who took part in the experiment have become enthusiastic, have continued to "Fletcherize," and have taken up physical culture in all of its branches.

A previous experiment described in the *Yale Medical Journal* had shown that those who consume little or no flesh foods have greater endurance than those who use flesh foods in abundance. It should be stated that in these experiments, and in others not yet completed, my point of view is not that of a physiologist, but of an economist. Much attention is now being paid to the physiological condition of the laboring classes, their housing, the sanitation of factories, hours of labor, child labor, etc. Equally important is the problem of the nutrition of these classes. Industrial inefficiency is the price of malnutrition. Increased labor power will be the practical outcome of diet reform.

The practice of slower eating is spreading rapidly, and is even reaching into the athletic world. Were the movement merely a fad, it would soon die a natural death, but there is too much sound physiology behind it to make such a result likely. Never before has there been so much interest in human nutrition and never before have so many scientists been at work on dietetic problems. As yet the study has only begun. As Professor Chittenden stated recently: "We are only just beginning to learn a little in the science of dietetics." It will doubtless take years before that science is thoroly established. In the meantime the average man, without needing to study dietetics in any technical way, can get the advantage of a scientific diet by following his appetite, *if only he will give up the hurry habit* by which that appetite has become perverted. It is not necessary to make a bore of eating. On the contrary, he who counts his chews or makes hard work of mastication by attending only to the mechanical act of chewing, will receive more harm than good from the practice. Pawlow has shown that the "appetite juice" in the stomach will not flow unless we attend to the taste and enjoyment of our food. The food should be chewed and relished with no thought of swallowing. There should be no more effort to prevent than to force swallowing. It will be found that if we attend only to the agreeable task of extracting the flavors from our food, Nature will take care of the swallowing which will become, like breathing, involuntary. It will also be found that taste will grow more discriminating and can be depended upon to guide us, both in respect to the kind of food and also in respect to the amount. The men who took part in the Yale experiment remarked with surprise on the keen sense of taste they developed and the number of flavors formerly unsuspected, which they had grown to appreciate in foods like bread, which formerly had been almost tasteless.

It is fortunate for the ordinary man that the taste instinct can be so easily revived, for it would be out of his power to prescribe for himself each day the exact quantity of food necessary for that day's work—the proper proportions of proteid, fat, starch and sugar, and the amounts needed of the fifteen odd mineral salts (salts of iron, sulfur, calcium, phosphorus, potassium, etc.), to say nothing of acids and enzymes, for each of which only one definite amount is ideally correct.

The loss of the delicate food instinct in the ordinary man has been aggravated not only by the habit of food-bolting, but by the habit of eating what is set before us by others, instead of choosing our food for ourselves. In the experiment at Yale none of the men were served anything until they had looked over the menu and made their own choice. While this procedure is not always practicable at home or in boarding houses, it is nevertheless within the power of the ordinary individual to use his power of choice more than he does at present. If he will do so he will usually be rewarded in a few months by reaching a condition of physical and mental efficiency of which he had scarcely dared to dream. The instinct to eat was given us for the purpose of enabling us to adapt our daily food to our varying daily needs. The realization that we have let this valuable instinct atrophy by disuse is the needed incentive to restore it to activity.

NEW HAVEN, CONN.

A Danger in American Education

BY M. V. O'SHEA

PROFESSOR OF EDUCATION, UNIVERSITY OF WISCONSIN

MODERN students of education and social well-being attach supreme importance to the long period of immaturity in the human species. The chick, the kitten, the puppy are able a few days after birth to care for themselves; from the start they can perform, in a crude way at least, practically all the activities of which their parents are capable. But they have acquired this early efficiency at tremendous cost, for they have sacrificed the opportunity of becoming educated. Heredity equips them with a number of instinctive actions, which limit their adaptation to just what their ancestors have done before them; they can make no progress; they cannot perfect their adjustments to their environments; they cannot to any important degree modify their environments so as to secure a larger life. They really begin existence as mature creatures, with their activities all pre-determined; and so for them improvement is impossible.

The young of the lower races of men mature much earlier than the children of highly developed peoples. Among some of the more primitive African tribes, boys and girls discharge certain of the functions of men and women before they have reached their 'teens. They are taking on adult traits at an age when many of our children are just entering school. Of course, the effect of early maturing is to put a stop betimes to development; and this is without question true of individuals among civilized peoples as it is of races. The children on the streets of a great city reach their adulthood, physically and mentally, several years befor children living under less stimulating conditions; and particularly when these latter children have opportunity to live the child's life as long as they choose, and are not urged into adult activities before the adolescent period is completed.

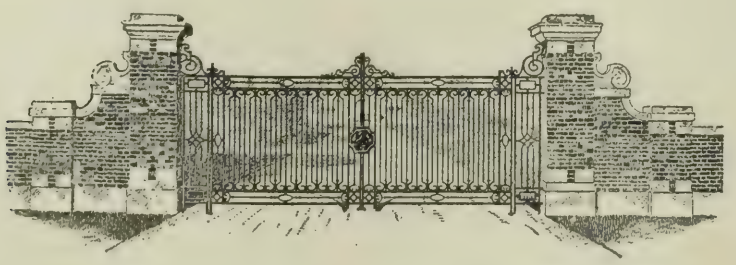
A study of European conditions will convince any one that those nations that keep the young plastic, and so educable, for the longest period are unquestionably the most vigorous, prosperous and progressive in every way. Italy illustrates the principle in a negative manner. The Italian children assume the functions of maturity considerably earlier, speaking generally, than the German or English children; and this is without doubt one reason why the Italians are dropping to the rear in the evolution of nations. The Italian people, unlike the Germans, are incapable of adjusting themselves to changing conditions due to social development along every line; each oncoming generation gets set too early, so that the young have time to assimilate only the simpler features of contemporary civilization. They have not even preserved their own achievements, for it is universally recognized that they are declining in art, in literature, in commerce, and especially in physical and moral vigor. Now, for several years while the German boy is in the learning attitude, appropriating all that has been discovered in recent times in every field of investigation, the Italian boy is conducting himself like an adult who is past the assimilative period. In consequence, the German boy gains knowledge and power which are entirely beyond the Italian boy, and when the former does become mature and begins to put into effect what he has gained, he will accomplish as much in one year as the latter will accomplish in five years.

Happily the trend in our own country thus far has been in the direction of lengthening the maturing process. A few decades ago the grammar school marked the close of the developing period for the great body of children, but we see now that a constantly increasing proportion of them remain in the assimilative attitude until they complete the secondary school and the college. Our people are committed to the policy of constantly extending the educational period for all our children; but there are

forces at work in our higher institutions which are threatening to counteract the beneficial results of a lengthened school course. I refer to the adoption of adult attitudes, interests and activities by high school and college students. Many observers of college customs are deploring the prevalence of practices hostile to the student temper of mind—smoking and drinking and political, social and gambling excesses. A considerable proportion of the students in our higher institutions receive very little profit from the advantages of a college. They are not in the learning attitude; they are too sophisticated; they have tried everything life has to offer, and they have lost interest in acquiring what the race has discovered that may make life richer for the individual and for society. Whatever they do is done in a purely formal and mechanical way; they are blasé before they have completed the period of youth, as always happens when ripening proceeds too rapidly. If adult activities be not assumed until full maturity of mind and body is reached they continue to have a wholesome interest, but it is quite different when the boy becomes a man in habits before nature intended he should.

Harmful as early sophistication is in the college, it is nothing short of disastrous in the high school; and our most serious problem in American education today is found right here. From every section of our country come loud complaints from teachers concerning the evil results of the general introduction into secondary schools of fraternities and sororities, athletic teams, "proms" and balls. The high school is aping the college, and even going beyond its excesses. Boys and girls not yet out of the pinfeather stage of development are assuming the conventionalities and customs of adults, and in consequence they are losing their interest in the developing activities that should occupy them mainly at this time. The testimony from every quarter is that the legitimate work of the secondary school is seriously threatened by the invasion of these extraneous interests, and there is a demand for heroic measures to keep the lives of our pupils simple and plastic and assimilative. Fortunately the Supreme Court of Washington has recently decided that in that State school authorities may impose penalties upon any pupil who allies himself with a school secret society; and the Supreme Court of Iowa has decided that the authorities of any high-school may prevent an athletic team from playing in the name of the school. These cases indicate both the attitude of high-school students, which is most unfavorable in many places, and one means of controlling the evils in question.

Parents are largely at fault in this matter, for they often encourage their children in their attempts to be "exclusive," and to mimic their elders in forming secret societies, attending theaters, balls and the like. They refuse to cooperate with teachers in their efforts to keep high-school life simple and wholesome, and suitable for continuous development. Such parents maintain that their children may do as they choose with reference to the matters in dispute, and it is not within the province of a teacher to say whether or not pupils shall join secret societies or drink or smoke or form athletic teams during school sessions. Principals report that parents often take delight in the thought that their girls are in a high school sorority, and attend balls, and have "beaux," while a neighbor's girls are not invited. Parents deliberately provide dances for high-school boys and girls, and they permit late hours and all the excesses practiced by adults. The excuse offered for this sort of thing is that young people ought to have diversion, and it is argued that the ball-room is more diverting than anything else. The existence of fraternities and sororites in the high school greatly aggravates the dancing malady, and this is one reason why teachers object to them so strongly, for they know very well that pupils who frequent the ball-room are incapable of effective work in the school.



Students of human development are universally agreed that when the relations between the sexes which the ball-room encourages become prominent early in adolescence the result will not be beneficial to either mind or body. One of the great problems in dealing with youth is to keep his attention off from sex relations of the sort indicated as fully as pos-

sible until the pubertal changes are completed. This does not imply that boys and girls are to be separated in their work, but there is a vast difference between their solving problems together in science or history or literature, and meeting in a ball-room for the purpose merely of personal contact. No people have ever long endured among whom the ball-room, and the relations which it develops, occupied an important place during the period of early youth. Speaking generally, when an adolescent catches the dancing fever, and it runs its course, his mental evolution ceases betimes. It is almost as disastrous when he gets a professional interest in an athletic team, either as a player or as a champion of a team. Everything of this sort operates to stifle interest in the less exciting situations presented in science or history or language; but the mastery of these latter is absolutely essential for the welfare alike of the individual and of society.

Parents are their children's worst enemies when they encourage them in adopting adult practices in their tender years. The boy and girl will really enjoy the experience of being initiated into a secret society far more if they wait until they have completed the high school at least. The adolescent will find wholesome pleasure, and genuine upbuilding pleasure, in a simple, assimilative, unsophisticated régime, if the people in any community will agree to keep the high school epoch free from these practices of maturity, which are now giving us such trouble. Teachers ought everywhere to resist the degenerating influences which threaten the secondary school, and parents and citizens ought to co-operate in every way possible. The aim must be to keep the period of youth simple and teachable, so that the thoughts of the individual may be turned toward the interests of the school, and away from extraneous interests, and especially sex relations, which undue emphasis early upon "party" activities accentuates. In a certain city in the Middle West, in which sororities and fraternities and athletic teams have flourished, the major part of the thought and energy of a large proportion of the students is devoted to these extra-school interests. The spirit among these pupils is unwholesome, and detrimental to right development, as is shown in the careers of some of them after they have left the high school. They are not a source of pleasure to themselves or to any one else.

An eminent European student of nervous degeneracy said to the writer last year that American life is overstimulating in its influence upon the young, and that if we did not discover some way to keep the lives of our children simpler we would come to grief sooner or later. Unquestionably we have much to learn in this respect from England and Germany, where the young remain in the assimilative attitude longer than they do with us now. Secondary education in several European countries is much freer from arrestive adult practices than it is fast becoming with us. From whatever standpoint one views the matter, he sees that it is absolutely imperative for teachers and citizens alike to keep the concerns of maturity from breaking into the high school. Let us have wholesome, upbuilding and relaxing activities in abundance; but the individual as well as society will be the gainer in every way if we reserve the interests of maturity until the developmental period is nearing completion.

MADISON, WIS.

THE EDUCATIONAL BOOKS OF THE YEAR

NO man can choose a wife for another, and he ought not to try to choose a text-book for another. The only assistance he can render is to introduce him to a larger circle of desirable acquaintances. The object of our annual educational review is to acquaint the teacher with such books as we think he would like to know about and to have them briefly appraised by practical teachers, so he can judge whether they are worthy of his further attention. It is impossible to pick out the "best" book on any subject, altho one might venture to say which is the worst. The "best" for any teacher is that most suited to his style of teaching, the capacity of his pupils, his time allowance and his library or laboratory appropriation. We have included in this survey some of the more important books in the line of professional reading, altho many such have been noticed during the course of the year in the weekly reviews.

English

The Little Grammar. By William Timothy Call. Hawthorne, N. J.: C. M. Potterdon. 50 cents.

The English Language. Its Grammar, History and Literature. By J. M. D. Meiklejohn. Boston: D. C. Heath & Co. $1.20.

English Grammar. By George R. Carpenter. Revised Edition. New York: The Macmillan Company. 75 cents.

School Grammar. By William H. Maxwell. New York: American Book Company. 60 cents.

The Making of English Literature. By William H. Crawshaw. Boston: D. C. Heath & Co. $1.25.

Steps in English. Composition-Rhetoric. By Thos. C. Blaisdell. New York: American Book Company. $1.00.

Composition in the Elementary Schools. By Joseph S. Taylor. New York: A. S. Barnes & Co. $1.00.

Rhetoric and Composition. By Edward Fulton. New York: Henry Holt & Co.

Elementary Composition. By Dorothea F. Canfield and George R. Carpenter. New York: The Macmillan Company. 50 cents.

Elementary English Composition. By Tuley Francis Huntington. New York: The Macmillan Company. 60 cents.

Written and Oral Composition. By Martin W. Sampson and Ernest O. Holland. New York: American Book Company. 80 cents.

Manual of Composition and Rhetoric. By John Hays Gardiner, George Lyman Kittredge and Sarah Louise Arnold. New York: Ginn & Co. $1.00.

The Art of Composition for High Schools and Academies. By William Schuyler and Philo Melvyn Buck. New York: Charles Scribner's Sons. 80 cents.

First Year English for High Schools. By E. S. Simons. New York: Silver, Burdett & Co. 60 cents.

Elementary English Composition. By Hammond Lamont. New York: Charles Scribner's Sons. $1.00.

Exposition in Class-Room Practice. By Theodore C. Mitchell and George R. Carpenter. New York: The Macmillan Company 70 cents.

An Introductory Course in Argumentation. By Frances M. Perry. New York: American Book Company. $1.00.

The Short Story. Its Principles and Structure. By Evelyn May Albright. New York: The Macmillan Company. 90 cents.

Selections From the Works of Joseph Addison. By Edward Bliss Reed. New York: Henry Holt & Co. 75 cents.

Carlyle's Heroes and Hero Worship. Edited by J. C. Adams. Boston: Houghton, Mifflin & Co. 50 cents.

Tales of a Wayside Inn. By Henry Wadsworth Longfellow. Handy Volume Classics. New York: Thos. Y. Crowell & Co. 35 cents.

First Folio Shakespeare. Life of Henry the Fift, Much Adoe About Nothing, As You Like It. New York: Thos. Y. Crowell & Co. 75 cents each.

Select Poems of Robert Browning. Edited by Richard Burton. Belles-Lettres Series. Boston: D. C. Heath & Co. 50 cents.

The Arthur of the English Poets. By Howard Maynadier. Boston: Houghton, Mifflin & Co. $1.50.

The Popular Ballad. By Francis B. Gummere. Boston: Houghton, Mifflin & Co. $1.50.

English Literature from the Norman Conquest to Chaucer. By W. H. Scofield. New York The Macmillan Company.

The Higher Study of English By A. S. Cook. Boston: Houghton, Mifflin & Co. $1.00.

Talks on Teaching Literature. By Arlo Bates. Boston: Houghton, Mifflin & Co. $1.30.

Literature and Life in School. By J. Rose Colby. Boston: Houghton, Mifflin & Co. $1.25.

In English the number of new grammars this year is so small as to be very nearly negligible. As a striking indication, however, of the growing conviction of the necessity for a simpler treatment of the subject and one more in conformity with the genius of the language, may be mentioned Call's *Little Grammar*, which pretends to embody the root of the whole matter in thirty moderate-sized pages—tho it may be doubted after all whether this is not dodging Scylla to run into Charybdis. Equally scanty appears the crop of "literatures"; Crawshaw's is perhaps the only one of any moment. Like most compendiums, it contains, of course, a good deal that is second-hand

and derivative. But its comments rise occasionally above the level of text-book convention and commonplace, and it is marked by some sense of literary development and affiliation. On the other hand, the array of "compositions" and "rhetorics" is no less bewildering than usual. Indeed, if possible, they are even more groping and at cross purposes than ever. In general, however, their tendency is still to cut away from the old formal, systematic treatment of rhetoric as a special science or branch of knowledge, with its own definitions, classifications, formulæ and various apparatus, and to substitute a discussion of the practical procedure of expression. That such a discussion should occasionally degenerate into a mere enumeration of rules of thumb and tricks of the trade is probably but natural and excusable. What is infinitely more mischievous at present is the inclination of these rhetoricians to take their mission too seriously, as a matter of high artistic significance. As an example of this extremity Blaisdell's *Composition-Rhetoric* is one of the most curious books that has appeared in a great while. It proceeds on the assumption that the proper aim of rhetorical study is literary "creation," to which the pupil should be stimulated at any cost. Agreeably with this notion it is composed in a tender, sentimental strain, calculated to touch the heart of the veriest little Philistine that ever defaced a desk; it is tremulous with feeling and sensibility; and altogether in spite of its evident admiration of literature it succeeds in being a compendium of all that is worst in the so-called "laboratory" method. From all such vagaries and misconceptions Lamont's recent manual is remarkably free, and is probably as sane an adaptation of orthodox methods to present needs as can be found. A little dry and cheerless, a little pedantic it is perhaps, as the traditional is bound to appear in the midst of innovation, but admirably conscientious and reasonable. In particular the chapter on argumentation is capital in its kind and contains for its scope a thoroly satisfactory presentation of the subject, divested of much of the scholastic formalism which is threatening just now to transform argument and especially debate into a vain intellectual gymnastic. Among the increasing number of books on special topics—for rhetoric is splitting up like everything else nowadays—Perry's *Argumentation* and Albright's *Short Story* are both informing and suggestive. Like Lamont's rhetoric, they have no disposition to confound teaching and bookmaking or to substitute the makeshifts of the

A FAULT CAUSED BY THE SAN FRANCISCO EARTHQUAKE.
From Salisbury's "Physiography."

classroom for the methodical development proper to a text-book.

Among the makers of annotated texts there is still evident the same willingness to duplicate what has been done well enough already which we have had occasion to deplore more than once. The *Selections from Addison* in Holt's "English Readings," tho one of the best of the year's performances, is hardly at the level of this excellent series—at least with respect to the introductory essay. The selections, however, are fairly representative and the notes sufficient. Adams's edition of *Hero Worship* is in the well known style of the "Riverside Literary Series," and is a useful text for the study on reading of Carlyle. Shurter's *Masterpieces of Modern Oratory,* all American, ought to make a good companion piece to the general text-book. It contains a good deal of matter which is new in this connection and affords a fair survey of the field, while the introductions, tho brief, are interesting and adequate to their purpose.

For advanced students and scholars already made or still in the making there is a comparatively wide variety of special material. In spite of a few errors of fact Maynadier's *Arthur* gives what is now undoubtedly the best consecutive account of the origin and growth of the Arthurian legend and its history in English literature. One of its most useful features is the amount of space—nearly half the entire voluume—which it devotes to the formative period of the story before its fixation by Malory. Gummere's *Popular Ballads,* too, may be considered an authoritative statement of present ballad lore. While Schofield's *Middle English Literature,* tho like these other works rather outside the competence of this article, may be referred to hastily as a book henceforth essential to a serious student of the period.

At the present time there seems to be springing up a new kind of writing, concerned mainly with the professional aspects of the subject—a sort of higher educational criticism, of interest primarily to teachers and the like. Such are Cook's *Higher Study of English,* a small collection of essays and addresses, including such topics as the teaching of English and its graduate study, and Bates's *Talks on the Teaching of Literature,* which is likely to be of particular interest, not so much because it proposes any very definite pedadogical program or *lehre,* as because it recognizes frankly the difficulties and limitations of the matter, and by setting a free current of discussion circulating about them, may assist the teacher in classifying his or her own ideas. To the same class belongs also Colby's *Literature and Life in School,* which is not merely a justification for the present study of English, but also a plea for its extension and improvement by bringing it into closer and more vital relationship with the actual experience of the pupils, tho, perhaps, the most interesting part of the volume is the chapters in which the writer attempts a tentative sketch of a practical literary curriculum. The book is also provided with a convenient appendix, composed of reading lists.

Greek and Latin

Plato: The Apology and Crito. Edited by Isaac Flagg. New York: American Book Company. $1.40.

Lucretius: De Rerum Natura. Edited by William Augustus Merrill. New York: American Book Company. $2.25.

The Aeneid of Virgil. Translated by F. Fairfax Taylor. With an introduction and notes by E. M. Forster. 2 vols. New York: G. P. Putnam's Sons. $2.00.

The Satires of Juvenal. By A. F. Cole. New York: G. P. Putnam's Sons. $1.00.

Homer's Iliad. First Three Books. Edited for the use of schools by J. R. Sitlington Sterrett. American Book Company. $1.60.

Nine Orations of Cicero. With Introductions, Notes and Vocabulary. By Albert Harkness. New York: American Book Company. $1.25.

The Mythology of Greece and Rome. Arthur Fairbanks. New York: D. Appleton & Co. $1.50.

Caesar's Gallic War. Books I-IV and Selections from Books V-VII. With Notes, Grammatical Appendix and Prose Composition. By Walter B. Gunnison and Walter S. Harley. New York: Silver, Burdett & Co. $1.25.

Beginner's Greek Book. By Allen Rogers Benner and Herbert Weir Smyth. New York: American Book Company. $1.25.

Beginning Latin. By John Edmund Barss. New York: University Publishing Company. $1.00.

First Book in Latin. By Alexander James Inglis and Virgil Prettyman. New York: The Macmillan Co. 50 cents.

Introductory Latin. By Frank Prescott Moulton. Boston: D. C. Heath & Co. $1.00.

Socrates defending himself before his judges and the last hours of the great master are among the foremost mental pictures of those who view ancient life with reverence and love. In this year of grace the immortal *Apologia* and *Crito,* in which Plato with completest art and

affection sets forth his teacher, are edited by a professor in the University of California. The work comes in the form of a schoolbook, pleasing and winning within and without, comprehending various readings of the text, a felicitous introduction upon the dialectics of Socrates and the figure of the martyr as he frequented Athenian highways and byways, and adding also index to text, and footnotes put where Dr. Johnson once said footnotes should be, *i. e.,* at the foot of the page, and elucidating the argument and grammar of these incomparable Greek classics. In another and later reformer and moral teacher, Lucretius, a contemporary of Cicero and like him of the Latin race, present-day interest is considerable. This interest is doubtless due to the widespread taste for science in our time, and to Lucretius' foreshadowing scientific principles enunciated today. In other words, science today is interested in the very problems discussed in *De Rerum Natura.* The moral hight of Lucretius, his devotion to truth, the majesty and purity of his verse, would now be known merely to the savant, if the poet had not forerun ourselves in curiosity as to the origin of life, the advance of the human race in civilization and enunciation of the never-ending warfare between science and theology. His great poem, *De Rerum Natura,* has been edited with erudition and clarifying and reverent zeal by the professor of Latin in the University of California. The work is for advanced college students, as is the introduction upon Lucretius, his philosophy and his poem's values. It is not a book to pass when college days are done, however, but to keep to read all thru life. Lucretius preceded Virgil and gravely influenced the author of the "Georgics" and the *Æneid.* The later work, translated by E. Fairfax Taylor, is published with the Latin on the left-hand page and the English verse opposite on the right—a convenience for many who wish to compare the two. The volume is one of a series, the "Temple Greek and Latin classics." Scant English notes are put at the end of the book. Of the same series is also at hand a later Roman poet—the satirist, Juvenal. His burning epigram and lifelike reproduction of decadent and cosmopolitan Rome are given in the old English version of Gifford, first published in 1802, with the Latin text placed alongside.

Harking back to the foremost and finest of epic poets are three books of the *Iliad,* edited by the professor of Greek at Cornell. It is now more than twenty-five years since the editor put forth his "Homeric Hymns," and his last work is replete with the learning and helpfulness gained thru many years. The book discourses upon the dialect of Homer, and, too, is valuable for its notes, vocabulary and illustrations of ancient monuments. All these facts are true also of *Nine Orations of Cicero,* edited by Professor Harkness, with the assistance of younger men, and all who look back with joy to the days when they held the veteran scholar's texts in hand will hail the clear, well-annotated text and the introduction about the powers of the Roman people and Senate and magistrates and courts of justice, and other furthering of the student in knowledge.

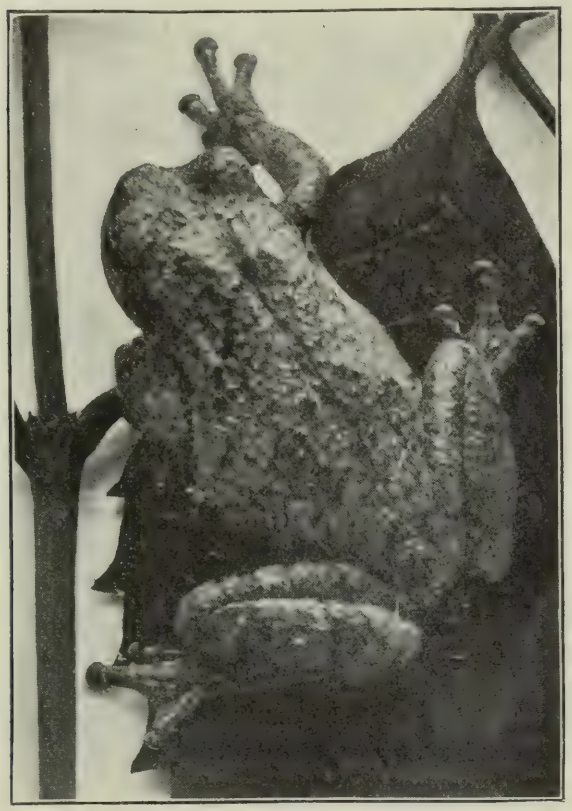
In this day, when many of our youths and maids are engaged in dissecting pollywogs or slicing the eggs of cockroaches instead of wandering amid the fair fields of old Greece and Rome, handbooks explaining the imaginative old stories are a necessity—else our modern youth would stagger before such moderns as Keats and Shelley and Lowell and Lloyd Mifflin. *The Mythology of Greece and Rome* is a book made to show the scientific folk, and also the student of the classics, the beauty and significance of the old myth. What are myths? How did they come about? Why are they worth study? What bearing have they on the life of the past—and even of the present?

The last edition we have of *Cæsar's Gallic War* from the "Commentaries," is a clear and admirable arrangement for the use of pupils in the second year of Latin. The pages are clear to the eye, and all the appended matter, such as introduction, prose composition, grammatical forms and vocabularies, are most excellent.

No longer is it thought that for a beginner in the old tongues "any old thing" will do. We have before us several new books, well edited and printed and illustrated. The *Beginner's Greek Book* is particularly good and carries the youth and maid far on their way. It is a pity,

however, that so small type is used in vocabularies thruout the book.

German



Goethe's Faust. Erster Teil. Edited by Julius Goebel. New York: Henry Holt & Co. $1.12.
Meyer's Der Heilige. Edited by Carl Edgar Eggert. New York: Henry Holt & Co. 80 cents.
Sudermann's Teja. Edited by R. Clyde Ford. Boston: D. C. Heath & Co. 25 cents.
Willkommen in Deutschland. By William E. Mosher. Boston: D. C. Heath & Co. 75 cents.
Wildenbruch's Das Edle Blut. Edited by Ashley K. Hardy. New York: Henry Holt & Co. 35 cents.
Bluthgen's Das Peterle Von Nurnberg. Edited by Wilhelm Bernhardt. Boston: D. C. Heath & Co. 35 cents.
Munchausen's Reisen und Abentèuer. By F. G. G. Schmidt. Boston: D. C. Heath & Co. 30 cents.
A German Grammar. By Francis Kingsley Ball. Boston: D. C. Heath & Co. 90 cents.
Erstes Sprach und Lesebuch. By Lewis A. Rhoades and Lydia Schneider. New York: Henry Holt & Co. 36 cents.

In German, as in French, the fewness of new texts is remarkable. Yet there are some distinctively good works this year. In the front rank is a new edition of *Faust,* by no means a small undertaking after the *opus magnum* of Professor Thomas. The day of new interpretations is not over, however, and the critical commentary on the evolution of Goethe's mind in the creation of Faust, and of the meaning of Faust, considered as the greatest dramatic product of modern times, arouses a current of reflection along new philosophical and historical lines in connection with the poem. Intensely dynamic and imbued with sympathy and appreciativeness, Professor Goebel's treatment will certainly touch the student's heart, and a great work must be felt at least as much as understood. A historical novel by the well-known Swiss-German writer, Meyer, concerns a figure whose dramatic personality and possibility has been ever growing—Thomas à Becket. In Meyer's treatment the great prelate is accorded a nobler interpretation of his motives than his usual fate has been. *Teja* belongs to the famous trilogy, "Morituri," and is one of the few historic-romantic dramas that Sudermann has attempted. Teja, with a small band, is the last of the Goths to uphold the traditions of his terrible race against the soldiers of Justinian. The futility of the struggle on account of the overwhelming odds, the preparation for death, the delicately interwoven love-story, all this is executed with the strength and fineness of a master hand. Mosher's *Willkommen in Deutschland* combines instruction with language teaching, describing a family passing thru some of the principal cities of Germany. Among books for beginners is Wildenbruch's *Das Edle Blut,* mentioned in previous reviews; Blüthgen's *Das Peterle von Nürnberg,* one of the best contributions of a famous *Jugendschriftsteller.* This little story is peculiarly adapted to the younger element, for it is a story of the struggles and final success of a Nürnberger lad of the Middle Ages. Munchausen's *Reisen und Abenteur,* the original tales of the most esteemed of modern liars, while undeniably interesting to boys, are not as profitable literature as the many existing introductory works. Ball's *German Grammar* is a satisfactory compendium of the grammar a beginner needs to know. It has the merit of originality in the mode of presentation, but is rather short for an entire year's work. *Erstes Sprach und Lesebuch* is a German primer of the usual form.

French

Quatre-Vingt-Treize. Par Victor Hugo. Abridged and Edited by C. Fontaine. Boston: D. C. Heath & Co. 50 cents.
L'Etincelle. Par Edouard Pailleron. Edited by O. G. Guerlac. New York: Henry Holt & Co. 35 cents.
Balzac's Ursule Mirouet. Edited by F. H. Osgood. New York: Henry Holt & Co. 80 cents.
Histoire de la Mere Michel et de son Chat. Par Emile de la Bedollière. With introduction, notes and vocabulary by Freeman M. Josselyn. New York: American Book Company. 30 cents.
Le Chevalier de Maison-Rouge. Par Alexandre Dumas. Abridged and edited by L. Sauveur and E. S. Jones. New York: American Book Company. 40 cents.
Quelques Contes des Romanciers Naturalistes. Edited by Louis H. Dow and Prescott O. Skinner. Boston: D. C. Heath & Co. 55 cents.
Poems of Victor Hugo. Edited by Arthur G. Canfield. New York: Henry Holt & Co. $1.00.
Moliere's Le Tartuffe. By John E. Matzke. New York: Henry Holt & Co. 50 cents.
Le Cid, Horace and Polyeucte. By Pierre Corneille. Edited by William A. Nitze. New York: Henry Holt & Co. $1.00.
La Chanson de Roland. A modern translation of Theodor Müller's Text of the Oxford Manuscript. By J. Geddes. New York: The Macmillan Company. 90 cents.
Through France and the French Syntax. By Robert Louis Sanderson. New York: Silver, Burdett & Co. 65 cents.
A Scientific French Reader. With notes and vocabulary. By Francis Harold Dike. New York: Silver, Burdett & Co. $1.00.
Les Classiques Francais. Beaumarchais, Le Barbier de Séville et le Mariage de Figaro. Montesquieu, Lettres Persanes. Madame de Sevigne, Lettres Choisies. Voltaire, Contes Choisies. La Bruyere, Caracteres. New York: G. P. Putnam's Sons. $1.00 each.
Lessons in French Syntax and Composition. By W. U. Vreeland and William Koren. New York: Henry Holt & Co. 75 cents.

It is the year of scarcity in new modern language texts, tho we do not complain of that, and we welcome the appearance of some original and excellent editions. Among familiar texts are Hugo's '93 and Pailleron's popular comedy. A new and appealingly humorous story of an easy grade is *La Mère Michel.* For about a grade beyond is a vivid story of the French Revolution, told by that prince of *racontcurs,* Dumas. No one can be more highly recommended for the mastery of fluent French prose.

TREE TOAD, SHOWING SUCTION DISKS ON THE TOES.
From Herrick's "General Zoölogy."

A collection of tales by the latest great French school of literature—the naturalistic—will appeal to the students whose grasp of mass and social relations and workings is becoming strong. A well-written introduction pithily characterizes this school, whose ideal is the union of life and art, and its main representatives —Taine, its philosopher; Zola, its social theorist; Balzac, its social psychologist; Flaubert, its romantic realist; Daudet, its charming impressionist; and De Maupassant, its erratic mosaicist.

Hugo's Poems are preceded by a fresh and sane judgment of its author's life and qualities, by an editor who knows what good poetry is, because he can write it. Molière's *Tartuffe,* epitome of the author and the age, is a valuable work to be placed in the hands of a thinking student, for its immortal satire of hypocrisy and prudery. Corneille's best-known dramas are to be included in one volume.

Most original of all is the putting into text form for college use the famous French Odyssey, the *Chanson de Roland.* The *Chanson* is exhaustively treated in notes, bibliographical, historical, literary, and in manuscript reading. The rugged simplicity, the martial ardor, the romantic elevation of this national epic and greatest of medieval *gestes* will leave its impress upon the student mind. Sanderson's book adds a spoonful of France to a plateful of French.

Dike's *Scientific Reader* contains a great variety of articles and authors from Descartes to Metchnikoff and will give the student a wider range of technical terms in French than he is apt to have in English. Tho not primarily intended for school use we must call attention to the beautiful edition of *Les Classiques Francais.* They are of convenient size for the pocket and bound in flexible stamped leather. Each has an original introduction in French by some well-known critic.

Spanish and Italian

El Sombrero de tres picos. Por Don Pedro A. de Alarcon. Edited, with introduction, notes and vocabulary, by Benjamin P. Bourland. Henry Holt & Co. 90 cents.

Cuentas Alegres. Por Luis Taboada. Edited, with notes and vocabulary, by Murray Anthony Potter. D. C. Heath & Co. 50 cents.

A Progressive Spanish Reader. By Carlos Bransby, Litt.D. D. C. Heath & Co. 75 cents.

The Romances of Chivalry in Italian Verse. Edited with introduction and notes by J. D. M. Ford and Mary A. Ford. New York: Henry Holt & Co. $2.00.

El Sombrero de tres picos, if not the best work of the author, is, at least, a splendid example of his capacity for humorous narrative. Apart from its skilful construction, admirable dialog and thoroly Castilian atmosphere, it is a valuable document for the student of Spanish manners and customs. The editor's introduction, besides giving a very full account of Alarcon's checkered career,

relates the genesis of the story and describes its esthetic import. The notes to the present edition furnish all the information necessary to a correct appreciation of the text; in some cases, however, they serve to display the editor's scholarship rather than to help the student.

Taboada has long held a high place in Spanish literature as a painter of the middle and lower classes of Madrid. He is not as well known beyond the borders of the Peninsula as he deserves to be. The sketches in the present volume are very bright and diverting, and prove him an author of distinct individuality. He reminds one occasionally of Murger's *La Bohème,* except that Taboada's Bohemia is a very innocent Bohemia. The book is well edited, the notes are helpful and the vocabulary is complete.

A Progressive Spanish Reader does not belie its title. The selections are short, simple and easy at the beginning, and become more elaborate gradually, concluding with stories from such great writers as Galdòs, Valera, Bazàn, etc. The "Specimen Questions with Answers" and the "Specimen Exercises in Composition" will be found useful both by teacher and pupil; in fact, there are too few of them, but an intelligent teacher can easily add to the number. The notes are full, clear and adequate.

Romances of Chivalry embraces some of the most beautiful and interesting cantos in the masterpieces of Pulci, Boiardo, Ariosto and Tasso. They should have the effect of stimulating the student's interest and inducing him to become more intimately acquainted with this noble poetry. The introduction, based on the researches of Pio Rajna and Gaston Paris, is scholarly and illuminative. The authors do not appear to be acquainted with the "History of Italian Literature," by Francesco Flamini, published a few years ago. His account of the evolution of the epic matter of France and Britany in Italy and of its rapid transformation into romantic and artistic narrative poetry is too important to be disregarded by any one who attempts to discuss this rather obscure and difficult subject.

ARGYNNIS CYBELE ON A THISTLE, NATURAL SIZE
From Galloway's "Zoology"

Mathematics

First-Year Mathematics for Secondary Schools. By George William Myers. Chicago: University of Chicago. $1.00.

Plane and Solid Geometry. By Edward R. Robbins. New York: American Book Company. $1.25.

Arithmetics. By Samuel Hamilton. New York: American Book Company. Primary, 35 cents; Intermediate, 40 cents; School, 45 cents.

Progressive Arithmetic. By William J. Milne. 3 vols. New York: American Book Company. First Book, 35 cents; Second Book, 40 cents; Third Book, 45 cents.

Practical Business Arithmetic. By John H. Moore and George W. Miner. Boston: Ginn & Co. $1.00.

Progressive teachers have for some time realized that mathematics could not much longer remain unaffected by the revolution in methods of instruction that has taken place in almost every other branch. The physical sciences continually demand more mathematics and at the same time complain of the quality of what they do get. Both algebra and

geometry are too rigid and artificial in their methods and too much isolated from each other and the practical work that they are intended to do in the world. In England a determined effort is being made to break up the petrified mathematical curriculum, and a similar movement in this country is indicated by the appearance of an unconventional course in *First-Year Mathematics* by Professor Myers and other instructors of the College of Education of the University of Chicago. It begins with the addition and subtraction of positive and negative numbers from such concrete instances as the rise and fall of a thermometer and a man getting wealth and running in debt, and within a day or two the pupil is adding and multiplying lines. It is an interesting experiment and ought to be tried wherever the regulations and authorities will permit.

The other mathematical text-books listed above are of a more conventional character and do not require special discussion. The *Business Arithmetic* has much of the old mathematical gymnastics and adds on to stocks, insurance and exchange. Robbins's *Geometry* has exceptionally well-printed demonstrations and numerous problems.

Physics

The Elements of Mechanics. A Text-Book for Colleges and Technical Schools. By W. S. Franklin and Barry McNutt. New York: The Macmillan Company. $1.50.

A Laboratory Course in Physics. By Robert A. Millikan and Henry G. Gale. New York: Ginn & Co. 40 cents.

Simple Experiments in Physics. By John F. Woodhull and M. B. Van Arsdale. 2 vols. New York: A. S. Barnes & Co. 65 cents each.

Forty Lessons in Physics. By Lynn B. McMullen. New York: Henry Holt & Co. $1.25.

Professor Franklin of Lehigh is well known as a thoro and unconventional thinker, full of original ideas, which are apt to be delivered like baseballs from the hand of a good pitcher, in curves not easy to catch. His success as a writer of text-books is partly due to the fact that he is a psychologist as well as a physicist, and understands, as few teachers do, that the great difficulty in the teaching of science is that it involves the development of new modes of thought, a transformation of the mind of the student, which, in the introduction to the present volume, he compares to the change of the axolotl from a tadpole to a salamander thru the increasing dryness of its environment. Like most men of science, Professor Franklin is a pragmatist; unlike most men of science, he knows that he is. He agrees with Bacon that "it is impossible to imagine any other basis upon which the study of physics can be justified than for the occasions and uses of life." He begins by repudiating the old definition of physics that it is "The science of masses, molecules and the ether." This, he says,

> "is the sickliest possible notion of physics, even if a student really gets it, whereas the healthiest notion, even if a student does not wholly grasp it, is that physics is the science of the ways of taking hold of things and pushing them."

The *Elements of Mechanics* is especially valuable for technical schools on account of the space given to the discussion of practical affairs and the calculation of real problems.

Millikan and Gale of the University of Chicago have made another attempt—and a very successful one—to solve the old problem of how to make a laboratory course in physics scientific and practical without undue expenditure of the time of students and teacher and money for supplies. Their manual contains many novel and ingenious pieces of apparatus, and the directions are well worked out. All teachers of physics in secondary schools should see it. Woodhull's *Simple Experiments* are more elementary and less mathematical. McMullen's *Forty Lessons* is a classroom text not differing materially from many others in the market, tho there is a novel arrangement of diagrams.

Chemistry

Introduction to General Inorganic Chemistry. By Alexander Smith. New York: The Century Company. $2.25.

Elements of General Chemistry with Experiments. By John H. Long. Fourth Edition. Philadelphia. P. Blakiston's Son & Co. $1.50.

A Text-Book of Elementary Analytical Chemistry. Qualitative and Volumetric. Third Edition. By John H. Long. Philadelphia: P. Blakiston's Son & Co. $1.25.

A Text-Book of Sanitary and Applied Chemistry, or The Chemistry of Water, Air and Food. By E. H. S. Bailey. New York: The Macmillan Company. $1.40.

Photography for Students of Physics and Chemistry. By Louis Derr. New York: The Macmillan Company. $1.50.

A History of Chemistry. By Ernst von Meyer. New York: Macmillan & Co. $4.25.

The *General Inorganic Chemistry*

which Professor Smith, of the University of Chicago, has produced, is distinguished from others of its class by its comprehensiveness and thoroness. There are 766 pages of solid print altho made convenient for reference and study by paragraphing and bold-faced type. This allows space not only for a large amount of descriptive matter but, what is more unusual and valuable, the detailed discussion of difficult points of theory. Thus, for example, eighty pages are devoted to ionic theory, not to its abtruse branches, but to an explanation in as simple a way as possible of the elementary conceptions that the student must have in order to understand modern chemistry. Too often the student is left to get this from his fragmentary notes on a lecture that he does not understand so much of as he thinks he does while he is listening to it. Professor Smith introduces a useful distinction between "formulative hypotheses," which are ultimately mere mnemonic schemes and "stochastic hypotheses," which are guesses boldly launched into the darkness just ahead of us, to work up to, and he is careful to warn the student against taking too literally the symbolic language of chemistry.

It is unnecessary to discuss such well known works as Long's *General* and *Analytical Chemistry,* which are now out in new and revised edition. Their quality and practicality are sufficiently certified by the thousands of students of all degrees of capacity that they have trained in the laboratories of the Northwestern University Medical School and elsewhere. The analytical manual contains many useful things not usually found in brief and elementary courses such as the detection of poisons and identification of important organic substances.

Professor Bailey began teaching "domestic chemistry" in the University of Kansas some twenty years ago, when most people did not know that there was any such thing, and now, when this branch of applied science and art is "booming" with buildings and corps of instructors of its own, he brings out a practical and comprehensive text-book. It is also sufficiently elementary and readable to be useful in traveling libraries and women's clubs. Professor Bailey is not a "faddist," but discusses in brief and sane manner all household affairs in which chemistry is a basis; fuels, ventilation, lighting, water supply, disinfectants, cleaning, food and cooking.

Many teachers especially in the West have demonstrated by their own experience that the ionic theory is valuable not merely for the hypothetical elucidation of difficult points in analysis, but also, and even especially, as a medium of elementary instruction. Students who are fed on ions from infancy are fairer and fatter than those brought up in the old-fashioned way. But there has been a lack of good text-books, so Professor Morgan's new *Qualitative Analysis* which is also intended to supplement the laboratory work of college course in general chemistry is especially welcome. All progressive teachers should become acquainted with the book whether they use it in their classes or not. The analytical tables are well contrived and the decorations are clearly worded.

We are glad to see that both Professor Bailey and Professor Morgan use the simplified spelling of chemical terms such as *oxid, chlorid* and *sulfate.*

The need of a text-book on the science of photography is met by Professor Der, of the Massachusetts Institute of Technology, in a book that gives the reasons for what the "guides" tell you to do. The illustrations of the action of different reducers and intensifiers is an interesting feature.

Biology

A Text-Book in General Zoology. By Glenn W. Herrick. New York: American Book Company. $1.20.

Laboratory Exercises in General Zoology. By Glenn W. Herrick. New York: American Book Company. 60 cents.

First Course in Zoology. A text-book for secondary schools, normal schools and colleges. By Thomas Walton Galloway. Philadelphia: P. Blakiston's Son & Co. $2.50.

Practical Zoology. An elementary text-book treating of the structure, life history and relations of animals. By Alvin Davison. New York: American Book Company. $1.00.

A Loose Leaf System of Laboratory Notes. For Guidance in the Dissection and Elementary Study of Animal Types. By Theo. H. Scheffer. Philadelphia: P. Blakiston's Son & Co. $1.00.

Half Hours with Fishes Reptiles and Birds. Half Hours with Mammals. By Charles Frederick Holder. New York: American Book Company. 60 cents each.

Principles of Botany. By Joseph Y. Bergen and Bradley M. Davis. Boston: Ginn & Co. $1.50.

The Human Mechanism. By Theodore Hough and Wm. T. Sedgwick. Boston: Ginn & Co. $2.00.

Physical Education. By Dudley A. Sargent. Boston: Ginn & Co. $1.50.
Town and City. By Frances Gulick Jewett. Boston: Ginn & Co. 50 cents.
Good Health. By Frances Gulick Jewett. Boston: Ginn & Co. 40 cents.

Herrick's *Zoölogy* is an interesting treatise on animals, but its general arrangement is such that it will not be most useful in high schools, where text-book and laboratory work must be closely correlated. Galloway's *Zoölogy* is said to be a "text-book for high schools and colleges," but in reality it is a systematic treatise entirely beyond the high-school pupils. It has many good points for teachers and college students. The *Zoölogy* by Professor Davison shows that the author knows how to select the most interesting facts for pupils of our high schools. It is *not* zoölogy for college students. Schiffer's *Zoölogy* is simply a set of printed sheets containing directions for laboratory study of the structure of a series of the common animals which are commonly included in college zoölogy. The two new books in the "half-hour" studies of animals are written in the same accurate and interesting style which characterizes Dr. Holder's earlier books. They will give the pupil a good general idea of the most interesting back-boned animals.

The *Principles of Botany* and *Manual* by Bergen and Davis mark a third stage in the development of the remarkably successful series of text-books of botany which Mr. Bergen has prepared. The "Elements" proved splendidly adapted to high-school botany of ten years ago. Then advances demanded expansion into the complete "Foundations." Now comes the still more advanced *Principles.* However, there is much evidence that there has been evolution beyond the high-school stage, and this new book and its companion manual will certainly be better in normal schools and first year in colleges than in the high schools of to-day.

In the *Human Mechanism* we have at last a thoroly modern presentation of the leading ideas in human physiology and personal and public hygiene. The book is well adapted to the short courses in normal schools and colleges. Sargent's *Physical Education* is an excellent series of essays treating of the urgent questions concerning physical education in America. Those interested in physical education will find the book well worth reading. The discussions of athletics in schools and colleges are particularly timely and suggestive. *Town and City* is Book III of the series of hygienes planned by Dr. Gulick, Director of Physical Education in New York City schools. It is an interesting account of the sanitary problems in which every citizen should be interested—overcrowding, clean streets, sewage and garbage removal, parks and playgrounds, water supply, pure food supply, disease epidemics, hospitals, etc. The required treatment of alcohol is included. The book is a vast improvement over the text-books which try to teach the anatomy and physiology of all organs to young children. *Good Health,* by the same author, is an excellent primer of hygiene far different from the stereotyped books in this line for the primary schools.

History

Outlines of Ancient History. By William C. Morey. New York: American Book Company. $1.50.
A Source Book of Greek History. By Fred Morrow Fling. Boston: D. C. Heath & Co. $1.00.
A Short History of Medieval and Modern Times. By Philip Van Ness Myers. New York: Ginn & Co. $1.10.
Outlines of Nineteenth Century History. By Philip Van Ness Myers. New York: Ginn & Co. 75 cents.
An Advanced History of Great Britain. From the earliest times to the death of Queen Victoria. By T. F. Tout. New York: Longmans, Green & Co. $1.25.
A Bird's-Eye View of American History. By Leon C. Prince. New York: Chas. Scribner's Sons. $1.25.
American History. For use in Secondary Schools. By Roscoe Lewis Ashley. New York: The Macmillan Company. $1.40.
Heroes of Progress in America. By Charles Morris. Philadelphia: J. B. Lippincott Company. $1.25.
Builders of Our Country. By Gertrude Van Duyn Southworth. Book II. New York: D. Appleton & Co. 60 cents.
First Steps in the History of Our Country. By William A. Mowry and Arthur May Mowry. Revised Edition. New York: Silver, Burdett & Co. 60 cents.

The historical offerings this year are rather scant in number. Several of them, however, are of exceptional excellence. Professor Morey's *Outlines of Ancient History* is skilfully planned, the mass of data is well chosen, and the style is simple and entertaining. A generous use is made of maps and drawings, and to each chapter is added a list of references for reading. Professor Fling's *Source Book of Greek History* is arranged as a reader for secondary schools. The copious se-

lections made from the Greek historians and poets are admirably chosen and methodically arranged. Questions, excellent notes, a considerable number of illustrations and a good index all contribute to its value as a classbook. Professor Myers's *Short History of Modern and Medieval Times* is worthy of high praise. Of the larger work on the same subject, noticed in these columns two years ago, we said: "We have here a combination of thoro and methodical scholarship, with vivid and picturesque narrative, qualities not often found in conjunction." The time treated is from the fall of Rome, 476 A. D., and the narrative is brought down to 1906. The chapters which cover nineteenth century history since 1815 have also been published separately under the title *Outlines of Nineteenth Century History,* including a final chapter, very brief, tho exceedingly valuable, on "The New Age: Industrial Democracy." Professor Tout's *An Advanced History of Great Britain* is a scholarly production. It is remarkable for the wealth of accurate detail that has been packed into it. The American references regarding the Revolutionary War and the War of 1812, tho necessarily brief, are fair and exact in statement. Professor Prince, it must be said, has not succeeded so well in his *A Bird's-Eye View of American History.* The tone is too frequently disputatious and even dogmatic, and many of his sweeping assertions reveal a bias that will unfit the book for a classroom. The whole chapter on the Civil War is faulty in the extreme; while the somewhat jaunty dictum in the preceding chapter, that "to discover the real and underlying cause of the Civil War we must look elsewhere than to slavery," displays a wilfulness in pressing a purely individual judgment against the consensus of historians, economists and sociologists everywhere. Mr. Ashley's *American History* is an admirable text-book. In wealth of matter, in accuracy of detail, in excellence of arrangement, in copiousness of citations, and in number and appropriateness of illustrations, it leaves little to be desired. We have no hesitancy in predicting for it an exceptional popularity as a class-book.

The biographical method is unquestionably the best for teaching history to young people, as it is to most of their elders. The three volumes which are intended for this purpose are, as is inevitable, very similar in scope and treatment, suitable either for class use or supplemental reading, compulsory or voluntary. Morris's *Heroes of Progress* is the most comprehensive and is intended for a rather older class of readers than the others. Book II of *Builders of Our Country* begins with Patrick Henry and ends with Andrew Carnegie, and is written in a more interesting manner than its close rival *First Steps in the History of Our Country,* which appears in a revised edition.

Geography and Physiography

Advanced Geography. By Charles F. King. New York: Charles Scribner's Sons.

From Trail to Railway Through the Appalachians. By Albert Perry Brigham. Boston: Ginn & Co. 50 cents.

The World and Its People. Views in Africa. By Anna B. Badlam. Revised Edition. New York: Silver, Burdett & Co. 65 cents.

Physiography. Advanced Course. By Rollin D. Salisbury. New York: Henry Holt & Co. $3.50.

Geographies become more and more sumptuous and attractive every year. King's Concrete Geographies, of which the Advanced Book appears this year, marks the highest level yet reached in its numerous illustrations, some of them colored, and its clear and striking maps, especially the relief maps.

Salisbury's *Physiography* is not merely a school book, but an important contribution to the science. It covers in part of course the same ground as Chamberlin's and Salisbury's Geology, which came out last year, and it is printed and illustrated in the same handsome form. The familiar stock cuts, surreptitiously diagramatic, are conspicuously absent, and in their places we find photographs of real examples of the things described.

Psychology and Education

Psychology. General Introduction. By Charles H. Judd. New York: Charles Scribner's Sons. $1.00.

Aspects of Child Study and Education. By G. Stanley Hall and Some of His Pupils. Boston: Ginn & Co.

Growth and Education. By John Mason Tyler. Boston: Houghton, Mifflin & Co. $1.50.

Classroom Management. Its Principles and Technic. By William Chandler Bagley. New York: The Macmillan Company. $1.25.

Methods in Teaching. Being the Stockton Methods in Elementary Schools. By Rose V. Winterburn. New York: The Macmillan Company. $1.25.

Principles of Secondary Education. The Studies. By Charles De Garmo. New York: The Macmillan Company. $1.25.

School Administration. By John T. Prince. Syracuse: C. W. Bardeen. $1.25.

Hints and Helps From Many Schoolrooms. New York: A. S. Barnes & Co. $1.00.

History of Higher Education in America. By Charles F. Thwing. New York: D. Appleton & Co. $3.00.

The Pestalozzian Movement in the United States. By Will S. Monroe. Syracuse: C. W. Bardeen. $2.00.

Sixty-five Years in the Life of a Teacher. By Edward Hicks Magill. Boston: Houghton, Mifflin & Co. $1.50.

The National Question Book. Questions and Answers for Study, Review and Examination, including special questions for teachers' and Civil Service Examinations. By Edward R. Shaw. Revised and Enlarged Edition. New York: A. S. Barnes & Co. $1.75.

Fiftieth Anniversary Volume of the National Educational Association. 950 Pages. With Index Volume. Winona, Minn.: Secretary of the Association.

A great many different kinds of books come out under the name of psychology. If it were not for the common title one would not guess that the books of Titchener and Thorndike, which we reviewed last year, and this new one of Judd were all three intended to teach the same subject. When you buy a geometry or a chemistry you know what you are going to get, but when you buy a psychology you may get anything from ghosts to logarithms. Professor Judd has produced a sane and solid volume intended as a general introduction to a series of text-books on the methods and principles of scientific psychology. It is well balanced and comprehensive, avoiding fads and dogmatism, utilizing and combining the results of both introspective and physiological researches. The author acknowledges his indebtedness to Professor James for influence and instruction. The reader will regret that the indebtedness did not extend further and include literary style.

IRRIGATION FROM PLATTE CANON.
From King's Advanced Geography.

The veteran apostle of child study in America, President G. Stanley Hall, has collected nine essays, written or inspired by him, in a volume which, as he suggests, might be called "Chips from a Psycho-Genetic Laboratory." It begins with a study of "The Contents of Children's Minds," which was published twenty-five years ago and was the first to call public attention to the desirability of including in a teacher's training a study corresponding to "strength of materials" for architects. Other topics discussed are child fetishism and the use of dolls, the development of curiosity and the collecting instinct, day dreaming and play, all treated in the well known style of the *Pedagogical Seminary*.

Growth and Education should be considered in this connection because it obviously owes much to Clark University thought and investigation, altho it is too important a piece of work to be classed as a "chip." Professor Tyler, of Amherst, has made a careful study of the physical and mental growth of the child, and has come to the conclusion that our schools are trying to cram too much information into unprepared brains supported by undeveloped bodies. He advocates rational physical and manual training to restore the balance disturbed by changed conditions of modern life.

More teachers fail thru lack of ability to manage their pupils than from all other difficulties of their profession combined. Where this is due to radical defects of personal character the case is hopeless, but more often it comes from lack of experience and the self-confidence that comes from conscious possession of experience. After spoiling a roomful or two of pupils the teacher may learn how to get along. This period of mutual distress may be shortened, and anyone's practice improved, by the study of such a book as Bagley's *Classroom Management*, which contains all the tricks of the trade as well as the reasons for them. Such difficult points as how to utilize the first day of school, how to secure attention, when to discipline, and what the Batavia system amounts to receive special attention. The author is a stickler for order and routine yet he presents fairly the arguments of the advocates of freer and more individualistic ways.

The *Stockton Methods* contain many ideas that schools outside of California may profit by, especially the utilization of local material in geography, history and nature study.

An important contribution to the discussion of the function of the high school in American life is made by Professor De Garmo, of Cornell. The educational value of the sciences and humanities and their relations to one another are impartially considered from the philosophical and practical viewpoints, and numerous examples of American and foreign curricula in secondary schools are presented and criticized. In planning courses of study for lower grades Prince's *School Administration* should be consulted. This is a very practical manual on all the details of the organization and supervision of schools, and will be of use to all superintendents and boards. *Hints and Helps* contains 150 minor and miscellaneous suggestions from as many different teachers, reminding one of "Recipes I Have Used" department of the woman's page of a Sunday newspaper.

On the history of education in the United States we have three books worth attention; first, of course, is President Thwing's comprehensive and interestingly written volume; a book for the public library as well as the school library. He has collected material from all sources, college journals and song books as well as catalogs and financial reports, and he carries it lightly along in his narrative and treats vexed questions with fairness and good temper. The other two books throw sidelights on our history. The educational and sociological influence of Pestalozzi in America is traced by Mr. Monroe, and ex-President Magill, of Strathmore, tells of a long life spent in college work.

Miscellaneous School Books

READERS.

Brooks's Readers. By Stratton D. Brooks. 5 Vols. New York: American Book Company. 25 to 60 cents.

Guide Book to English. By Charles B. Gilbert and Ada Van Stone Harris. 2 Vols. New York: Silver, Burdett & Co. 45 and 60 cents.

The Rational Method in Reading. Additional First Reader and Additional Primer. By Mary A. Ward and Madalene D. Barnum. New York: Silver, Burdett & Co.

A First Book in English for Foreigners. By Isabel R. Wallach. New York: Silver, Burdett & Co.
Eclectic Readings. Little Stories of Germany, France and Animal Fables. New York: American Book Company. 40 cents each.
The Cave Boy of the Age of Stone. By Margaret A. McIntyre. New York: D. Appleton & Co.

RECITATIONS.

Standard Selections. Edited by Robert I. Fulton, Thomas C. and Edwin P. Trueblood. Boston: Ginn & Co. $1.25.
Selections for Memorizing for Elementary Schools. Edited by Avery Warner Skinner. New York: Silver, Burdett & Co.
American Poems. With notes and biographies. By Augustus White Long. New York: American Book Company. 90 cents.
Werner's Readings and Recitations. No. 35. Cats and Kittens. Edited by Mrs. Frederick W. Pender. New York: Edgar S. Werner & Co. 60 cents.
Masterpieces of Modern Oratory. Edited by Edwin DuBois Shurter. New York: Ginn & Co. $1.00.

MUSIC.

Natural Music Course. Melodic Readers. By Frederic H. Ripley and Thomas Tapper. 4 Vols. New York: American Book Co.
Songs for School. By Charles Hubert Farnsworth and Harvey Worthington Loomis and B. D. Allen. New York: The Macmillan Company. 60 cents.
The Song Primer. By Alys E. Bentley. New York: A. S. Barnes & Co.
The Song Primer. Teacher's Book. By Alys E. Bentley. New York: A. S. Barnes & Co.
School and Festival Songs. By John B. Shirley. New York: American Book Company. 25 cents.

High School Manual Training Course in Woodwork. Including Cost of Equipment and Supplies and Studies on Trees and Wood. By Samuel E. Ritchey. New York: American Book Company. $1.45.
Elementary Sloyd and Whittling. With drawings and working directions. By Gustaf Larsson. New York: Silver, Burdett & Co.
Modern Penmanship and Its Practical Application. By C. L. Ricketts. Chicago: Laird & Lee. 60 cents.

The Hayload

BY ROSE GOODALE DAYTON

Oh, the hill farms of New England, steep and stubborn tho they be,
Mullein-dotted, woodchuck-burrowed, granite-gray!
Here alone in fullest measure we behold with flawless pleasure
All the curing and the housing of the hay,
All the raking and the making of the hay!

Here the mighty car of progress balks at hillsides walled with stone,
Self-dependent daily labor, all engrossing, holds its sway.
Devon steers obey the goad; home-built hayrack bears the load;
Sun and wind and human effort cure the hay.
Full of meaning is the gleaning of the hay.

And the men who guide the oxen, and the men who place the load,
They are truly master craftsmen in their way.
Thru their kinship with the soil, and their unremitting toil,
They've attained a wondrous knowledge of the hay,
Of the growing and the mowing of the hay!

Breathe it deeply, breathe it long—was there ever air so sweet?
'Tis a fragrance that can rival even May!
Ah! Could any earthly power take me back to childhood's hour,
'Twould be riding on a load of clover hay,
Care-dispelling, joy-compelling, new-mown hay!

South Norwalk, Conn.

Korean Devils and Christian Missionaries

BY DAVID KELLEY LAMBUTH

[The following very interesting contribution to the psychology of religion is based upon letters and reports from American missionaries, of which Mr. Lambuth, of Vanderbilt University, has made a special study. Since the conditions of life and work on the Christian frontier in the Far East are similar to those of the early days of Christianity, this article throws some light upon New Testament narratives. In China the same effect of the environment upon the missionary has been observed. The Rev. John L. Nevius, during his life in China, became convinced of the reality of modern "demon possession," of which he gives many instances in his book of that title.—EDITOR.]

THREE religions nominally occupy Korea: Confucianism, Buddhism and Shamanism, which is a polite name for the worship of devils; but Confucianism, a code of ethics rather than a religion, has left the way open to a simultaneous practice of demon-worship, while Korean Buddhism has largely degenerated into the Shamanism about it. "From the hour of his birth until the spirit leaves his body," says one missionary, "the Korean is surrounded and tormented by innumerable evil spirits"; while another declares that the "only real religion of Korea is the worship of every sort of evil spirit." "So full are they of superstition," comments a third, "that it takes much time and effort for them to understand the simplest truths." In such an atmosphere what more natural than that the missionaries, who live in closest intimacy with the people, and isolated from the daily contact with Western forms of thought, should imperceptibly be wrought upon not only by the persistent fear and belief of the unchristian populace, but also by the exaggerated tendency toward demonology inbred thru ages into those who are now converts to Christianity, who cannot out of hand brush off a lifelong habit of mind? An examination of the facts shows that the missionaries in Korea display a sense of the presence of evil spirits markedly in excess of that manifested in other countries where demonology has no such popular hold. The spirit-saturated air has with insidious power waked in the missionaries all the dormant demonology with which the Christian religion was at one time furnished forth.

The quotations which follow are, with one exception, taken from printed articles or public addresses, and only in two cases are more than one statement taken from the same source, so that they represent authoritative deliverances and cover an extended field.

A peculiar sense of the presence of an evil spirit is evidenced thus:

"In a country where the evil spirit is so dominant and so tangible, one comes to a vital sensation of his presence."

"Certainly I am more conscious of the real presence of the devil in Korea than in America. Many of the missionaries have been acutely conscious of his palpable presence in the very room with them."

"The consciousness of a real personal devil is as vivid as the sense of God's presence, though infinitely removed in kind. In Korea you feel him in the atmosphere."

More important testimony is offered in the evidences of belief in possession by devils, a belief that has fastened with a peculiar and tenacious grip upon the people of Korea, so that one writer calls the country "the haunted house among the nations, afflicted with the delirium tremens of paganism." "The Christians, too," says one missionary, "hold to the possession by evil spirits." "Demoniac possession in that country," says another, "becomes a thing too evident to doubt." "Thousands of people," says a third, "are slaves to evil spirits, in bondage to His Satanic Majesty (sic)," while another describes a woman, "possessed of many devils," and still another tells of "miracles performed, the crazy made of sound mind, the devil-possessed set free."

"At the services was a young man, demoniacally possessed, made dumb by his indwelling spirit for three years. After long prayer and

a command to the spirit to depart, it left him and he began to read aloud."

Another was "a man with every symptom of demoniacal possession, in whom, upon catching sight of the preacher, the demons began to rave." Again, prayer brought "a marked change over the demoniac." He slept that night, the first for many days, and in a vision saw that God had "driven the evil spirits out of his heart and home." Again:

"Five years this woman had been a sorceress, practicing her devilish magic upon all whom she could find. The instant she lay down at her home her muscles contracted, her hands clinched and her eyes set, and the devil would say to her, 'Why do you lie here idle? Go out and do your work.' She burned herself with hot irons to get rid of him, but only found that he did not have a sensitive nature."

Christian neighbors prayed over her, but the "devil cried out, 'I will not listen.' She was rolled in convulsions on the floor by the devil, but continued crying out, 'Depart from me,' until at last he fled out of her."

"During the revival the feeling was so intense that one man fell into raving insanity, his violence and superhuman power breaking to pieces even the iron chains that bound him and snapping an iron bar like glass, evidencing demoniac possession no less real than that of the man in the country of the Gadarenes. The devils were trying to frighten us and our converts into silence."

Prayer was again successfully resorted to. "The spirits left him and he came to himself."

No more complete avowal of belief in demoniac possession than the following could be required:

"In our work in Korea we are continually coming in contact with the most extraordinary cases of apparent demoniacal possession and cure, containing all the phenomena that characterized demonized minds in the days of Christ."

Another writes pertinently:

"If you had lived in the midst of the native quarter with me and heard at midnight the cries of terror of those appealing to the evil spirits for help or being tortured by them, veritable possession by devils would then seem no impossible thing to you."

There is little reason to doubt that this diagnosis of the case is correct, for under circumstances such as these it would indeed be the unusual man that went his way unmoved.

This spirit-laden air has generated a sense not only of possession by devils, but also of their malignant presence on every side, indicated by such statements as "At our preaching the legions of Satan fled," or "Travelers enter these huts," referring to the wayside shrines, "and recognize one or the other of these score of devils that reside inside." But most amazing and unequivocal of all is the actual admission of the possibility of a demon cult, sinful in character, but based upon premises whose validity is unquestioned:

"In truth, these spirits of evil are never hard to find. I have never seen them, but the Koreans do. Not only do they try to propitiate the devils, but they pray to them, *and the devils honor their faith. Of that I have seen too many evidences to doubt.*"

Such facts point irresistibly to a relation of cause and effect between the Shamanistic beliefs of the Korean people and the strangely vivid sense of demoniac presence experienced by the missionaries, since in other countries less devil-ridden they have by no means displayed a tendency to the construction of so liberal a demonology. The point at issue, which is the unconscious and insidious tendency of the foreigner to accept the native point of view, is sufficiently admitted in such phrases as, "the Korean's native power of insight into spiritual matters," or "the Korean's marvelous sense of sin," while most naïve and enlightening of all is a remark that palpably admits the whole contention: "The woman was insane—or, as the Koreans with more accuracy say, 'possessed of a devil!'" And in that word the entire story of the interaction of religious conceptions and modes of thought stands epitomized. On every man must his environment, mental as well as physical, inevitably react. The influence of the missionary upon the unchristian nations, whether for individual or social life, has been both deep and salutary, yet it may be that the evidence of the reaction of these several nations upon the missionary's attitude and formal creed may serve to demonstrate that the mental differences of races must inevitably modify the institutions and beliefs which they may mutually adopt, and that the formal garment of religion in East and West must diverge as radically as the psychology of Orient and Occident differ from each other.

The Transmutation of Metals

No more sensational discovery could be expected in science than that just made by Professor William Ramsay, of University College, London. If he has indeed changed copper into lithium as the preliminary and premature report indicates, he has accomplished what chemists for a thousand years have labored for and despaired of. The transmutation of one metal into another was the earliest dream of the science and for a long time its most powerful inspiration and incentive. But the alchemists in their search for the philosopher's stone found so many other things more valuable that they gave up their unprofitable labors in this direction.

There was nothing absurd about the aim of the alchemists. From an *a priori* standpoint it was just as plausible to think that the number of elements was seven as seventy. Or, since the object of science is to reduce the complexity of things to the greatest possible simplicity of ideas, and since the best way to find out the truth is to start out by assuming that what you think ought to be true is true, why not adopt the working hypothesis that all matter is essentially one, and if we were only a little cleverer we could reduce all the elements to a single form? It was only when chemists found that this working hypothesis did not work that they laid the instrument aside, still never altogether abandoning the secret hope that some day there would be found to be "something in it." Whenever the lecturer on chemistry came to the discussion of the laws of the conservation of matter and energy and said, "we can neither create nor destroy energy but we can change any form of it into any other," he always felt vexed that his science was behind its rival, physics, and that its corresponding law could not be expressed with similar completeness and simplicity, instead of his being obliged to say, "We can neither create nor destroy matter and there are some seventy different forms of it that we cannot do anything with."

There has been a continual increase in the amount of theoretical evidence to show that the elements are not eternal, independent and immutable foundation stones of the universe, but there was no experimental evidence of genetic relationship until it was discovered within the last few years that the metal radium is continuously and spontaneously giving off a heavy gas, referred to as the "emanation" which gradually decomposes into the very light gas helium. But since helium was a parvenu in the circle of the elements, and radium of still more dubious standing, antecedents and authenticity, and the emanation too small to be detected, except by its temporary radio-activity, the old idea of immutable elements was still tenable. Last year, at the British Association for the Advancement of Science, Lord Kelvin, the foremost physicist of England, disposed of the question to his own satisfaction by saying that if helium could be obtained from radium the obvious conclusion was that radium contained helium in the first place.

But a case of transformation of one well-known element into another, like copper into lithium, cannot be dismissed so lightly. Sir William Ramsay says that the emanation from radium decomposes differently according to circumstances. If it is dissolved in water it produces neon. When a solution of copper sulfate is used instead of water, argon is the result. These three gases form a natural group of inert elements by themselves corresponding to the other series of the Periodic Law. In the order of decreasing atomic weights the series is xenon (128), krypton (88), argon (40), neon (20), and helium (4). Apparently

the heavy gaseous emanation, which is still unidentified, gradually breaks down, sinking lower and lower in the scale as it throws off its radio-active electrons, until it is stopped at some stage of its downward career and forms one of these very stable and inert gases.

But this is not all. The emanation seems to exert a bad influence on its associates and degrades them also. When it is conducted into a solution of copper sulfate or nitrate and the copper afterwards removed, the residue shows with the spectroscope the characteristic red line of the element lithium, which was previously absent. Now, as we should expect, these two elements also belong to the same natural family, which is, beginning with heaviest atomic weight, gold (197), caesium (133), silver (108), rubidium (85), copper (63), potassium (39), sodium (23), lithium (7). It is possible that other members of the series like sodium or potassium may be formed also by the degradation of copper, but as they were constituents of the glass vessels used this could not be proved.

If these experiments are confirmed it would suggest that each of the natural families might be reduced to its lowest number, giving eight or nine primary elements, which would be a considerable advance toward the ideal unity. Whether we shall ever be able to go up the stairs is still more doubtful. It is easier to tear down than build up. Any compound can be broken down into its elements, but there are many compounds that we cannot form from their elements. A big molecule like sugar, $C_{12}H_{22}O_{11}$, is easily broken down into its three elements of carbon, hydrogen and oxygen, but we are not able to put them together again right, altho we hope to in time, for it is humiliating to confess that man is inferior in ability to a beet.

The only elements that appear to decompose spontaneously are those with very heavy atoms, uranium (238), thorium (232) and radium (225). That we may be able some time to reverse the process and change lithium into copper and copper into gold is conceivable, but if possible it would not be profitable, because the amount of energy necessary to be absorbed to effect the transmutation would cost more than the gold produced. The important thing from a scientific standpoint is that we have in the electrons, which are thrown off from the radium atom like mud from a carriage wheel, an astonishingly powerful and delicate instrument of research. Our previous attempts to break up an atom and transform it into something else were like trying to pick a lock by firing cannon balls at it twenty miles off.

It has long been known that there is in the universe, as far as we know it, a constant degradation of energy into lower forms. The new discoveries indicate that the same may be true of matter. The universe seems to be running down like a clock. Whether there is somewhere about it a self-winding attachment that continually compensates or periodically restores it, is another and deeper question.

The Controversy in North Carolina

It is reasonable to inquire whether the agreement reached in North Carolina on Saturday last, concerning the dangerous dispute over the enforcement of the new passenger rate law, is an equitable one. By that law the railroad companies' charge for transportation was reduced from $3\frac{1}{4}$ to $2\frac{1}{4}$ cents a mile. They are entitled to more than $2\frac{1}{4}$, and possibly to $3\frac{1}{4}$, if they can prove that the reduction to $2\frac{1}{4}$ is confiscatory and therefore unconstitutional. They have now consented to collect only $2\frac{1}{4}$, pending the final decision. If that decision shall be in their favor, they will lose the difference on all the tickets sold during the interval, for they never can collect it from those by whom the tickets were bought. On the other hand, under Judge Pritchard's restraining order, every buyer of a ticket at the old rate was receiving a rebate coupon, and the roads were bound to pay back the excess, upon application, if the law should be sustained in the court of last resort. In that event, the excess would have been collected by a very large majority of the holders of coupons.

This was a just provision, and Judge Pritchard's action was more equitable than that of Judge McPherson, who directed that the roads in Missouri should try the 2-cent rate for a few months.

Those roads, if the Missouri law should be pronounced confiscatory and void, cannot recover the loss on their tickets.

These considerations relating to the controversy in North Carolina may seem unimportant, when compared with the larger aspects of the case, but they tend to show that the Federal judge proceeded with caution and sought to safeguard the rights of all parties. It was his duty, as we understand it, to restrain temporarily the enforcement of the law if the evidence presented (at a hearing in which both parties were represented) made, in his opinion, a *prima facie* case against the statute. He did undertake so to restrain enforcement, but provided for a prompt examination of all the facts by a commissioner, sought to hasten the expected appeal, and endeavored to guard the rights of ticket buyers. So much for his action in the early stages of this dispute, which promises to be a memorable one. He knew that in some way the question must go to the Supreme Court. The most direct path was thru his court. His method of procedure was not unusual, and it promised less delay than other methods.

It is plain enough that the order of Judge Pritchard, an equitable one and an order of the Circuit Court of the United States, was disobeyed by the Governor of North Carolina, who virtually directed, in his letters to State judges, that it should be ignored, and then, in various ways, exhibited his purpose to disregard or oppose it. Governor Glenn has now succeeded in imposing his terms upon the railroad companies, who see nothing to be gained by continuous fighting with the State Government, but his course was unworthy of a man holding so high an office. It was in harmony with that of the judge who sentenced two ticket agents, respectable citizens who were obeying the orders of the railroad company's offices, to serve for thirty days in the chain gang. The order of the Circuit Court should have been respected, and from the beginning the State's officers should have co-operated with that court in procuring a final decision at the earliest possible date. The terms of the order were such that the rights of the humblest ticket buyer would be protected.

Judge Pritchard's estimate of the evidence laid before him on June 20th may have been incorrect. As to that, the Supreme Court will eventually decide. But he was acting in the line of his duty, and we see no indication that he was moved by anything but a desire to administer justice. He has not yet expressed the opinion that the rate reduction of the law is unconstitutional. His opinion on this point was to be based mainly upon the report of the commissioner and the arguments at a final hearing. In holding that the statute's penalty clauses—enforced, in two instances, by chain gang sentences—are unconstitutional, he seems to have ample warrant in Supreme Court decisions.

But the question is not whether this judge is infallible. It is whether the controlling officers of a State Government ought to disobey and defy the just orders of the Federal Circuit Court, orders which involved no oppression and which could be respected without a loss of dignity by a State whose authorities approve chain gang punishment for decent men who follow the directions of their superior officers and of the Federal Court in selling railroad tickets at a certain price.

This controversy directs attention to the effect of State regulation of railroad rates upon interstate rates and the regulation of them by national authority. It may easily happen that severe reduction of rates, for freight as well as for passengers, by a State, will compel changes in the interstate rates outside of that State and thus interfere with the orderly adjustment of such charges under the direction of the Federal Commission. A sharp reduction in one State might suggest and cause a compensatory increase elsewhere.

State regulation should be subordinated to national regulation or in harmony with it. Otherwise, the efficiency of national regulation must be impaired. Our internal commerce tends more and more to ignore State boundaries. Frequent recurrence of such conflicts of authority as this one in North Carolina would tend to prove that, for the public good, national supervision and regulation should prevail. Our people will not insist upon State regulation that affects interstate traffic if they shall become convinced that

it is hostile to the public interest; and if then the Constitution shall not permit the desired national control, they will amend it.

The Real Work at The Hague

We fear the average individual has gained a very erroneous impression of the Peace Conference now in session at The Hague from the reports that have been published in the American dailies and weeklies. One would think from reading these that the delegates, when not automobiling over the shaded brick roads of Holland, or giving dinner parties for their wives to outjewel each other, are for the most part spending their time discussing the probable trajectories of dum-dum bullets, squabbling over the trivialities of legal definition, or in other respects chasing the iridescent rainbows of impracticable impossibilities.

It is quite true that the Second Peace Conference will not bring about the millenium. Indeed, it can go no further than the most backward nation is willing to go. In his striking speech at the recent National Arbitration and Peace Conference, held in New York City, Secretary Root well illustrated this point when he said:

> "Such a Conference is an agency of peace; not the peace of conquest, but the peace of agreement; not enforced agreement, but willing and cheerful agreement. So far as the nations can go together in such an agreement the Conference can go and no further."

Unanimous consent is the rule of the Conference, and nothing is referred back to the nations for ratification without it.

What, then, can we reasonably expect from the delegates of the forty-seven nations of the world who now for the first time in the annals of history are assembled in what will some day grow into the Parliament of Man? The session of this Conference will be divided, as was the first Conference, into four main periods: (1) organization, (2) preparation and introduction of propositions for discussion, (3) discussion and acceptance or rejection of these propositions, and (4) welding the accepted propositions into final form and adopting them. The present Conference past thru the first period in less than a week, very much quicker than the first conference, because public sentiment has greatly changed during the past eight years, and the unpreparedness and suspicion that were manifest in 1899 have given place today to mutual confidence and a determination on the part of delegates to get down to business and waste as little time as possible over details and red tape. Indeed, this faith of the delegates in themselves and in the outcome of their mission is one of the most striking features of the present Conference, and is evident to any visitor at The Hague except the typical diplomat or journalist. Unfortunately, these two classes of public servants seem congenitally incapacitated from comprehending the philosophy of the Peace Movement or conceiving the possibility that the delegates can consider any questions apart from their effect on domestic politics, triple alliances, balance of power, Drago doctrines, benevolent assimilations or yellow perils. It would surprise these cynics to visit the headquarters of any of the delegations at The Hague and see the delegates reinforced by half a dozen attachés and clerks hour after hour ransacking blue books, state papers, and international law books to discover all that has been said and done in the past that will throw light on present problems. And while it is true that etiquet will require each delegate to take time enough to leave in person about a thousand visiting cards on his colleagues before his departure from The Hague, it is equally true that nearly every one of them is putting in as many hours of hard study a day as the average Yale undergraduate does the week before semi-annuals. With such a spirit of hard and conscientious work prevailing, it means that the home governments are expecting results.

At the present moment the Conference is at the end of the second period of presenting propositions, and in the beginning of the third period where these propositions are discussed and passed upon. The criticism, therefore, that nothing has yet been done is manifestly out of order, for nothing can be finally accomplished until the fourth stage is reached.

Yet even now much can be pretty safe-

ly predicted. The rules of war on both land and sea will be more clearly defined and the actual conduct of war will be made more humane. This is the negative work of the Conference. In the much more constructive work of extending the scope of international law and finding practicable substitutes for war, it is almost sure that the present Hague Court, epochal as was its establishment, will be superseded by a much more permanent and compact tribunal, that the collection of debts by force can only be made after a resort to arbitration, thus removing the chief cause of war between Europe and South America and incidentally freeing us from intervening in such disputes on account of the Monroe Doctrine, and that future Conferences will assemble hereafter automatically and periodically, or at least be taken out of the hands of Russia.

We look to see the American delegation make a very strong stand for this principle of the periodic and automatic assembling of future Conferences, and if success crowns their efforts our delegates will have done as great a thing for this Conference as Mr. Holls, of the American delegation, did in the first Conference, when he persuaded Germany to reverse her attitude of opposition to the establishment of The Hague Court and support it, thereby creating a supreme tribunal of the world. To carry this out in detail the American delegation should introduce some such proposition as the following: (1) that the next Hague Conference should meet in June, 1912, and every five years thereafter unless called together sooner by the signatory Powers; (2) that the diplomats at The Hague who now constitute the administrative council of The Hague Court should also be the administrative council of The Hague Conferences; (3) that they should notify the signatory nations a year ahead of the convening of the court and ask each nation to send in propositions for discussion, which should immediately be transmitted to all the other nations for study and which should be put in the hands of every delegate when he arrives the following year at The Hague, and (4) that the Conference should organize itself so that no nation can dictate the program or hold any of the offices by precedent or right.

These four provisions would make the next Hague Conference the first parliament of the world. We have reason to believe the delegation of the United States sees the opportunity. President Roosevelt and Secretary Root should realize that this is the paramount issue.

The Haywood Verdict

It was not anticipated—not at all—that the jury would acquit Haywood of conspiracy for complicity in the murder of Governor Steunenberg. It is not easy nor right to go back of a verdict of twelve men. Beyond question they honestly believed, or eight of them who were for acquittal from the beginning, that the evidence did not prove beyond reasonable doubt that Haywood and his associate officers of the Western Federation of Miners conspired with Orchard for the murder. Four members of the jury voted at one time or another for conviction, but they were overborne by the arguments of the rest. We expected, as did most, that the jury would disagree, for, while Orchard's testimony was corroborated to some extent, it seemed impossible that among twelve men so chosen there would not be some who were fixt in their mind beyond the possibility of change.

It is agreed that the judge's charge did it. It was a fair charge, the same that is always given, that there must be evidence beyond "reasonable doubt" to convict. But many minds cannot balance what is a reasonable doubt. If they can imagine any concatenation of circumstances that would explain away the evidence, some men will call that reasonable, which is really unreasonable, doubt.

Nevertheless, the great public, which has no local prejudice or fear on either side, believes that what Orchard, the assassin, did he was told to do, and that he was provided for in the doing of it. The severest cross-examination only confirmed his direct testimony. There certainly was a succession of murders. They were plotted, beyond all doubt. There was a band of conspirators for these murders. Orchard clearly did not travel and spend money and kill on his own bare initiative. He was unquestionably the tool of other men, and it is these men that most deserve to die. Who were

they? The verdict says that it was not proved that Haywood was a conspirator. Nevertheless there was a conspirary of murder somewhere, and so long as he lives Haywood will rest under suspicion, for four of the jury believed it and the rest voted to acquit him because of "reasonable doubt."

Murder in a passion, or murder for private malice, is a sad thing; but vastly graver is the evil to society when a company of men are banded in the conspiracy to murder their enemies. Unfortunately such conspiracy is not easy to prove, even when we have no moral doubt of it. It requires the confession of one of the band, and his testimony is worthless unless abundantly confirmed. Here in these Eastern States we have Italian conspiracies and an Armenian conspiracy, and murder after murder in each, and only the weak and ignorant tool caught, while those who plotted and directed these murders cannot be proved guilty. A multitude of Armenians will tell us that they know who is the pock-marked priest who is at the head of the band, and the police know his name, but they have not the evidence to hold him.

We are told that such a contest as that which existed in those regions between the miners and the operators was a state of industrial and social war, and that in war everything is permissible. The doctrine is atrocious, it is horrible, it is barbaric. In a time of peace we may speak of war in a figure, but it is only a figure. It is not war, and those who kill or do other lawless acts are not heroes; they are assassins and deserve to be hanged. But on both sides acts of real war were done. Miners were seized by violence and railroaded out of the State with no legal authority; and on the other side even men like Governor Steunenberg were marked out for assassination because they had incurred the enmity of the members of the Federation.

It is a fearful thing that bands of men should so far condone the murder of those whose interests are against them that they should rejoice in their death by violence. Where men talk so, as did that Armenian priest the other day, or as we hear everywhere in these "industrial wars," it is to be expected that there will be plots and conspiracies for murder. If those who talk most violently are put in authority they will plot murder and find their chosen tools, vile men, but not so vile as those that employ them. Here is a terrible menace to society, and it will be fortunate for society when, as in the Molly Maguire murders, those who are most guilty can be convicted.

We hope the result of this trial will be to check the tendency on both sides to use violent methods and still more violent language in the settlement of industrial questions. It is the duty of the great mass of the people who are not directly and vitally interested in these struggles to see that both sides play fair, and keep within the forms of law.

Academic Exchange: Domestic and Foreign

Baron Kaneko Kentaro writes wisely on the way to bring about a better understanding between the East and the West. It is true, as he says, that the Orient and the Occident would hardly be estranged in these days by reason of their religious differences, while, unfortunately, race prejudice, or something that passes for that, is at the present moment not decreasing in acrimoniousness.

To sensible folk, the seriousness with which a good many persons talk about the probability of war between the United States and Japan seems almost as incomprehensible as it is monstrous. Until recently Japan and the United States have maintained with one another the most friendly relations. Japanese students who have attended American colleges and universities have carried home not only an almost worshipful admiration of American institutions, but also an affectionate personal regard for their American teachers. Japanese industry, education and legislation have copied much from American models. The people of the United States were openly sympathetic with Japan during the recent war with Russia. That such relations should suddenly give place to suspicion and irritation is a circumstance that points to causes that lie among the

blind instincts and passions of the human mind. They are not facts of the rational understanding.

The unhappy truth is that prejudices, including the so-called race prejudice, have ceased to be to any great extent the phenomena of religious difference, confusion of tongues and difference of color that they once were. The prejudices of today spring from economic sources. The hostility of California to the Japanese has precisely the same industrial antecedents that the Chinese exclusion policy had.

The same explanation holds, when all has been said, for the race conflict between blacks and whites in our Southern States. If there had never been any other white population in the South than the aristocratic plantation owners, and if these had come out of the Civil War with fortunes unimpaired, and ready to employ negro labor on a large scale, there could never have been such bitterness between blacks and whites as now exists. The cause of trouble has been, and is, the increasing economic competition of an improving black race with the population descended from the so-called poor whites of earlier days.

Again, the same explanation holds for most of the prejudices that in some degree mark off various sections of the Northern United States from one another: New England, the Middle States, the Middle West, the Pacific Coast. Economic competition becomes year by year more strenuous. The economic life determines manners, morals and legislation, so that in forms of intercourse, in demeanor, in habits and in the petty hostilities of local types there appear those relatively unimportant, yet real, differences that distinguish the populations of the various economic areas.

These differences reveal themselves for the most part in feelings, instinctive attitudes and dogmatic convictions, rather than in reasoned out opinion. Really educated men the world over understand one another. The intellectual life is cosmopolitan. The philosopher is the only true man of the world. Therefore it is that so long as differing economic interests and the rivalries that they engender tend to create misunderstandings, and the whole brood of prejudices and ugly passions, the only counteracting influence that can be depended on is that of ideas. The diffusion of knowledge and the interchange of thought lift men above pettiness and reveal to them the greater interests that constitute the large human weal.

It is characteristic of the clear, scientific Japanese vision that Baron Kentaro looks directly to the academic class for this higher educative influence. Travel and merchandising are contributory forces, but they cannot act with the power and precision of the minds that are themselves creative of new ideas and broad, intellectual relations. To put such minds from time to time into new environments where, from advantageous centers, they can act directly upon the populations whose misunderstandings are elements of danger, is to use with greatest possible effect such resources as we have for creating that comprehension of class by class, of people by people, of race by race, which may in some measure diminish strife.

And if the interchange of professors can exert this influence of nation upon nation, why may it not be resorted to as the obvious means of bringing about a completer knowledge and sympathy between one part of the American people and another? Why should not professors in Northern colleges and universities lecture from time to time at Southern seats of learning, and professors from the South give courses in the Northern institutions? There have been conspicuous cases of excellent results from the calling of Southern men to Northern universities and Northern men to Southern. The current of influence thus created could be much quickened by the introduction of the yearly exchange. Even between the greater institutions of the North exchange would be in a hundred ways beneficial. Harvard and Columbia, Yale and Princeton, Columbia and Chicago are sufficiently different one from another to have each its atmosphere and point of view. The professors in each would benefit by occasional residence and work elsewhere, and they would carry to their temporary chairs a certain freedom of expression and handling of subject

which would be liberalizing and stimulating to their new students and associates.

Boys' Social Culture Club

Vashon College is the prominent feature of the landscape above the small village of Burton, on Vashon Island, which lies in Puget Sound half way between Seattle and Tacoma. Its students, all native-born Americans, and all under twenty-one years old, come from the neighboring States and Alaska. In the common dining-room a teacher and five students sit at each table. Last autumn there was much criticism by some students concerning the table-manners of their mess-mates, and at one table a "Social Culture Club" was organized, under a constitution prescribing certain rules of conduct at meals. This wakened interest at the other tables and resulted in general membership in the club, a president, general secretary and treasurer being elected, with a sub-treasurer at each of the ten tables, to collect all fines imposed there. By-laws were adopted, prescribing fines as follows:

Using toothpick in public	2c.
Hand in pocket at table	2c.
Scuffling under table	2c.
Not sitting erect at table	1c.
Tilting chair back	2c.
Chewing with mouth open	2c.
Talking with mouth full	2c.
Putting crackers in soup	1c.
Slangy or blustering talk	2c.
Uncomplimentary remarks about food	2c.
Pushing individual dishes away	1c.
Placing another dish on plate	2c.
Knife or fork misplaced	1c.
Spoon left in cup	1c.
Incorrect holding of knife or fork	1c.
Arms or elbows on table	2c.
Overreaching	1c.
Eating from point of dessert or table spoon	1c.
Buttering large piece of bread	1c.
Eating from knife	2c.
Buttering bread on table	1c.
Untidy appearance	2c.
Napkin badly soiled or absent	2c.
Selfish conduct at table	2c.
Flagrant misuse of English	1c.
Talking across from table to table	2c.
Spearing bread with fork	2c.

The club, in which all the faculty and their families as well as all the students became members, effected a marked improvement in the manners of the students. At the close of the school-year, last June, it was found that every member of the club had paid fines, and that there were no delinquent debtors. The amount of the fines, eight dollars, provided strawberries for the closing banquet, in which all culprits shared. This we publish for whom it may concern.

Express Rates

The second pound of a parcel from Kansas City to Denver is .10; the second pound of a parcel from Boston to San Francisco is .05; 5¼-pound package by express from St. Louis to Denver is $1; 11-pound package by express from Liverpool, England, to Denver is $1; a 7-pound package from Maple Grove, Me., to Denver is $1; an 8-pound package from Maple Grove, Me., to Denver is $2.05. Maple Grove, Me., is an exclusive point of the American Express Company, which company is not directly represented at Denver, and the injustice of the rule is clearly shown by comparison of the foregoing example of rates under the rule, with the following example of rates which do not come under the rule: A 7-pound package from Boston, Mass., to Denver is $1; an 8-pound package from Boston, Mass., to Denver is $1.35. The rates of American Express and British Parcels Post are compared in the following table:

	London to Denver.	Denver to London.	Denver to New York.
1 lb	$0.50	$0.70	$0.30
2 lbs.	.50	.75	.35
3 lbs.	.50	.85	.45
4 lbs.	.75	1.15	.60
5 lbs.	.75	1.35	.80
7 lbs.	.75	1.55	1.00
10 lbs.	1.00	2.05	1.35
11 lbs.	1.00	2.30	1.75

Library Exhibitions

The Free Library Association of Newark, N. J., when building, had in view not only the ordinary purposes of such a library, but exhibitions of an economic and instructive sort were specially anticipated. These exhibitions have been very numerous and largely attended. Recently there was a notable show of native wood, of insects that injure our trees, of materials illustrating the uses of our forest trees, and pictures of parks, gardens, forests and notable trees. The exhibition is worthy of special comment, and should draw the attention of other

cities and towns for similar purposes. The Forestry Department of the National Government has assisted the association, and several of the States have contributed; so also a large number of park commissions as well as landscape gardeners and nurserymen. The first object of the exhibition is to popularize the study of trees, and by showing their utility to farther the ends of economic forestry. But very much can be done, in this way, to call the attention of the people to the beauty and the glory of nature, and teach them the real poetic value of a noble tree. There should be a municipal or town improvement association in every township in the United States. Why it should not be associated with public libraries we do not understand. It looks, however, more likely that in the near future our public-school system will have so evolved and perfected itself that it will be the town center for this very sort of work. The old and the young should work together in beautifying and glorifying the town; and anything of this sort is in its highest sense educative.

No Penguin Poet

The Indiana prairies are full of poets, and one of them, possessed of unusual fluency, when told that he cannot be one of the wingless penguin poets lately described by THE INDEPENDENT, but that his cursory muse allies him to the *Cursores,* or running birds, which include the ostrich, cassowary, etc., sent us the following jubilant lines:

I am the Ostrich Poet,
I'm past the Penguin state;
And tho you may not know it,
I'm "going some" of late.
And so I'll set a lively pace
For nimble birds and fleet.
And in this literary race
Just use poetic feet.

Yes, I'm the Ostrich Poet,
No Penguin, for my strides
Conclusively will show it
To all the birds; besides,
My muse is not a mere pretense,
Because, at any rate,
When other poets take *offense*
I always strike a gait.

He well deserves the plume. One so agile on his feet may well claim to be the Ostrich Poet, unless he prefers to take the name of that swiftest of American avian racers called the road-runner.

A Library or a Statue

Mr. Clement Shorter, an Englishman, wants fewer books and more statues. Thus he writes:

"It was a happy thought—this monument to Mrs. Gaskell. I wish we could persuade other rich men to do similar things. If only Mr. Carnegie, instead of subsidizing these ridiculous libraries, would cover the London parks with statues after the fashion of the Tuileries Gardens! I want at this moment two thousand pounds for a statue of Dr. Johnson to stand in Kingsway, looking toward Fleet street. I have got the sculptor and the design, but I have not yet found the millionaire with the two thousand pounds. Yet what a chance for him!

So instead of helping us toward a tame little village structure, built of dark refuse brick and covered with vines, with its interior finished in oak beams and panels of dull green, historically harmonious with its architecture, Mr. Carnegie ought to have given us a $10,000 statue of Dr. Johnson! To the casual observer it is not an excessively "ridiculous" charity that attracts boys from the streets into a warm, softly lighted room, with small tables and wide chairs, where undisturbed they lean comfortably over magazines and illustrated papers; that provides an adjoining room, where children, some from bookless homes, spend many a rainy Saturday or idle and quarrel-breeding Sunday afternoon, having free access to the shelves that contain such pure delight.

Increasing Cost of Production

A writer in THE INDEPENDENT lately assumed that, with the perfection of machinery and the more careful oversight of manufacture, the product per hour or man has much increased of late years. This conclusion is far from being accepted by students of the subject. A recent Bulletin of the Department of Commerce and Labor indicates that our American manufacturing industries have for ten years past been decreasing in efficiency, in the sense that the output per workman and the net product per one thousand dollars of capital invested are diminishing; and trade

unionism is not the principal cause of the decline. Reduction in the hours of labor and the prohibition against working too hard may have something to do with the loss; but consolidation and trust organization, so far from diminishing the cost of production, have apparently increased it over wide areas. The chief waste is in the loss of close personal attention to details which the old-time manufacturer was wont to exercise in his mill or factory. The waste in fancy salaries, unnecessarily elegant office furniture and decorations, and other things to match which have crept into the expenditures of consolidation are sometimes appalling. If the United States Government should happen to carry out its threat to put two or three big trusts into the hands of receivers, it would be well not merely as a means of making them obey the law, altho that is important enough, but because it will expose the unbusinesslike and costly methods of these supposedly able men of affairs, who are making their fortunes not by superior methods and diminishing cost of production, but by illegal monopoly and financiering. The last illustration of the fact that profits are lessening seems to appear in the threat to raise the price of thread to ten cents a spool because there is no profit in the old price.

The "Masque of Medieval Learning."

All the English critics are agreed that the most charming, and in a literary point of view the best, thing in the Oxford Historical Pageant was the "Masque of Medieval Learning." We had observed that in one English journal its authorship was credited to a young American student named Markoe, but our account of it, following an official program, credited it to Prof. Walter Raleigh. But Professor Raleigh has written to the press saying that this was a mistake, and that the author is Francis Hartman Markoe. Mr. Markoe is the only undergraduate who contributed to the Pageant. He is twenty-three years old, a son of Dr. Francis H. Markoe, a well-known New York surgeon, was graduated at Yale last year, and was taking a year of study in Oxford, intending to study subsequently in Paris, Munich and Bologna. It was an amazing compliment that he was asked to write for the Pageant, and all agree that his work was the climax of the show from the literary point of view, and that his part of the Vain Student in the Masque was brilliantly played. At Yale he took many prizes for original literary and dramatic work, and was a prominent actor in feminine rôles in the Yale Dramatic Association. Mr. Markoe is quoted as saying that he greatly values Oxford for the teaching of repose in manner and judgment, and an appreciation of the value of tradition. He would have students go there for a short time, but not stay long enough to impair their originality and independence.

Americans in Korea

Under date of Seoul, Korea, June 22d, Mr. Philip S. Gillett, General Secretary of the Seoul Young Men's Christian Association, writes us seriously traversing an article in our issue of April 25th on "Korea," by William T. Ellis. He says:

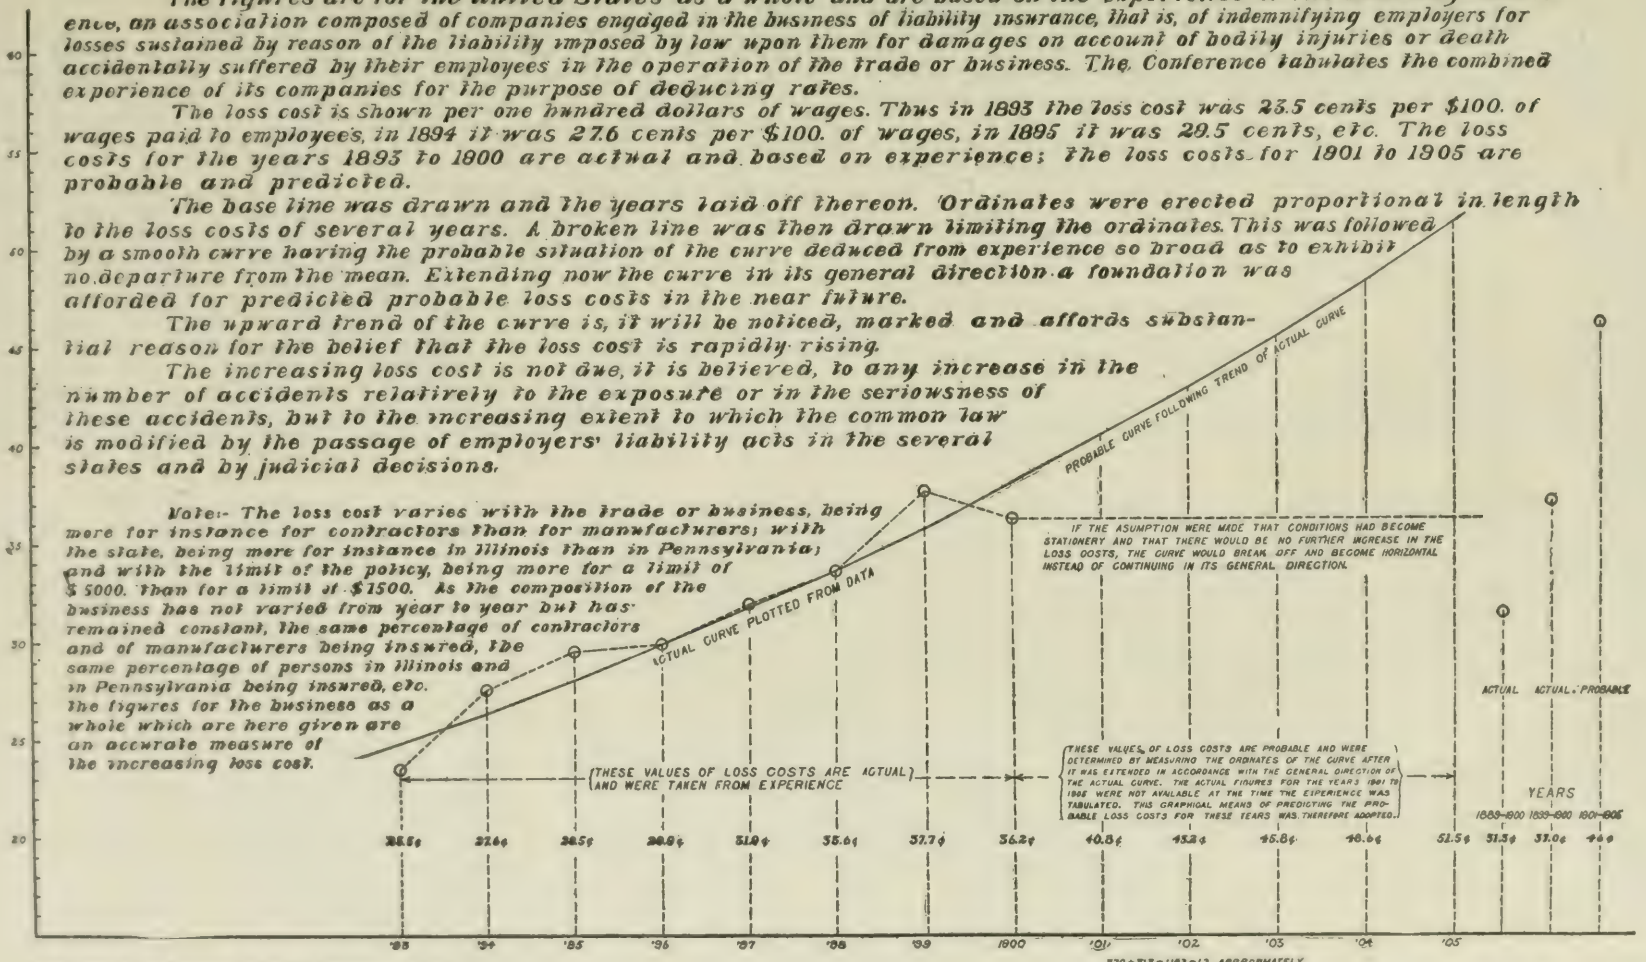
Without wishing to cross swords with Mr. Ellis I feel that it is obligatory to say that he has a wrong idea of the attitude of the American and English missionaries in this country. For example he says, "An American went on to declare, what I have heard stated a score of times in different parts of Korea, that there is today not a white man in all the land (except the Advisor to the Japanese Government) who is not bitterly opposed to Japan's course." If Mr. Ellis thinks this gives a fair idea of the present attitude of the missionaries he is a much mistaken man. I was present at a casual meeting of four missionaries yesterday who were angry when this sentence was read to them. I give it as my opinion that most of the missionaries in Korea approve in general of what the Japanese Administration is now doing in Korea and believe that it is both sincere in its declared purpose and is proving itself practically capable in the working out of national reforms in Government administration, education, financial and commercial lines.

The Japanese Government has a hard enough probem to deal with the long-standing enmity of the two races, the corruption of Korean officials and the greed and aggressiveness of many of the Japanese immigrants, who rushed into the country just after the war, without having resident and traveling American citizens block her progress by withholding their sympathy and by intentional or unintentional misrepresentation.

On June 19th Marquis Ito attended a meeting of the Methodist missionaries in Korea, and sympathetic and appreciative addresses were made by him and by Bishops Harris and Cranston.

CHART ILLUSTRATING INCREASING LOSS TO EMPLOYERS IN THE UNITED STATES BY REASON OF THE LIABILITY IMPOSED BY LAW UPON THEM FOR DAMAGES ON ACCOUNT OF BODILY INJURIES OR DEATH ACCIDENTALLY SUFFERED BY THEIR EMPLOYEES.

The figures are for the United States as a whole and are based on the experience of the Liability Conference, an association composed of companies engaged in the business of liability insurance, that is, of indemnifying employers for losses sustained by reason of the liability imposed by law upon them for damages on account of bodily injuries or death accidentally suffered by their employees in the operation of the trade or business. The Conference tabulates the combined experience of its companies for the purpose of deducing rates.



The loss cost is shown per one hundred dollars of wages. Thus in 1893 the loss cost was 23.5 cents per $100. of wages paid to employees, in 1894 it was 27.6 cents per $100. of wages, in 1895 it was 29.5 cents, etc. The loss costs for the years 1893 to 1900 are actual and based on experience; the loss costs for 1901 to 1905 are probable and predicted.

The base line was drawn and the years laid off thereon. Ordinates were erected proportional in length to the loss costs of several years. A broken line was then drawn limiting the ordinates. This was followed by a smooth curve having the probable situation of the curve deduced from experience so broad as to exhibit no departure from the mean. Extending now the curve in its general direction a foundation was afforded for predicted probable loss costs in the near future.

The upward trend of the curve is, it will be noticed, marked and affords substantial reason for the belief that the loss cost is rapidly rising.

The increasing loss cost is not due, it is believed, to any increase in the number of accidents relatively to the exposure or in the seriousness of these accidents, but to the increasing extent to which the common law is modified by the passage of employers' liability acts in the several states and by judicial decisions.

Note:- The loss cost varies with the trade or business, being more for instance for contractors than for manufacturers; with the state, being more for instance in Illinois than in Pennsylvania; and with the limit of the policy, being more for a limit of $ 5000. than for a limit of $1500. As the composition of the business has not varied from year to year but has remained constant, the same percentage of contractors and of manufacturers being insured, the same percentage of persons in Illinois and in Pennsylvania being insured, etc. the figures for the business as a whole which are here given are an accurate measure of the increasing loss cost.

ABSCISSAS, THE HORIZONTAL DISTANCES, REPRESENT YEARS
ORDINATES, THE VERTICAL DISTANCES, REPRESENT LOSS COSTS PER $100 OF WAGES FOR ALL TRADES AND BUSINESSES AND FOR THE UNITED STATES AS A WHOLE

$37.0 \div 31.3 = 1.182 = 1.2$ APPROXIMATELY
$46.0 \div 31.3 = 1.46 = 1.5$ " "
THE MEANING OF THESE FIGURES IS THAT THE LOSS COSTS IN 1898 AND 1900 WERE TWENTY PER CENT. (20%) HIGHER THAN THE AVERAGE LOSS COST FOR THE PERIOD 1889 TO 1900 INCLUSIVE, AND THAT IT IS EXPECTED THE LOSS COST FOR THE PERIOD 1901 TO 1905 INCLUSIVE WILL, WHEN ALL CLAIMS HAVE BEEN SETTLED, BE FOUND TO BE FIFTY PER CENT. (50%) HIGHER THAN THE AVERAGE FOR THE PERIOD 1889 TO 1900 INCLUSIVE.

Tariff Questions

FORMAL protest against the new tariff agreement with Germany was made last week by the American Protective Tariff League. At a meeting of the board of managers and executive committee the subject was discussed, and long resolutions offered by General William F. Draper, of Massachusetts, were adopted. Copies of these resolutions have been forwarded to President Roosevelt, the members of his Cabinet, and members of the Senate and House. The league's complaint relates to the concessions as to "export prices" for dutiable market value, the waiving of the demand for a statement of cost of production in the case of consigned goods, and the use of special agents acceptable to the German Government. This last concession is equivalent, the league says, to a discontinuance of investigations in Germany as to fraudulent undervaluation. Taking into account all the concessions, it asserts that "these modifications or annulments of the statutes will result in a reduction of from 10 to 25 per cent. of the duty levied by law upon merchandise imported from Germany on which ad valorem duties are assessed." Therefore the league

"—earnestly protests against the provisions of the German tariff agreement as contrary to law, contrary to the policy of protection, injurious to American labor, unfair to the honest American importer who buys in the foreign market and makes entry at the price he is compelled to pay, demoralizing to the customs service generally, and in effect a material and indiscriminate reduction in the tariff which should be made only after hearings granted, and then by the legislative branch of the Government."

If action taken at our ports under the agreement is in violation of law, the league should find some way of proving this in court.

There are signs that the Democratic party will strive to make tariff revision a leading issue in next year's campaign. In this it may be assisted by the work of the Tariff Committee of the National Manufacturers' Association, altho this committee does not desire such a revision as a Democratic Congress would make. Mr. Miles, the committee's chairman, prefers revision thru the agency of a commission, and he predicts that Congress will create a commission next winter. We expect that he will be disappointed, if, as it is reported, he looks for a permanent body "somewhat like the Interstate Commerce Commission," by which the tariff shall be "taken out of politics." Congress will create no Tariff Commission of that kind.

....Surveys have been made and a company formed, with a capital of $5,000,000, for the construction of a trolley line from Atlanta to Augusta, Ga., a distance of 160 miles.

....A new subsidiary company has been formed by the New York, New Haven & Hartford Railroad Company to take charge of express business on the latter company's many trolley lines.

....Stocks listed on the New York Exchange during the first half of 1907 amounted to $432,609,630, against $662,769,450 for the entire year 1906, and $533,434,900 in 1905.

....Electric motors have displaced steam locomotives in passenger service between New York and New Rochelle on the New Haven road, and will probably be in use as far as Stamford by September 1st.

....John F. Stevens, formerly Chief Engineer of the Panama Canal, has been made a vice-president of the New York, New Haven & Hartford Railroad Company. He has recently been engaged in making a valuation of the company's property.

....A decision of much importance with respect to telephone service is the recent one of Judge Hunt, of the United States Court in Montana, that one company must furnish connections to another, when desired, at reasonable compensation.

Survey of the World

The Oil Trust Fined $29,240,000

A fine of $29,240,000 was imposed upon the Standard Oil Company by Judge K. M. Landis, of the United States District Court, in Chicago, on Saturday last. This is the largest fine ever assessed by a court against a convicted individual or corporation. The defendant is the Standard Oil Company of Indiana, all of whose capital stock, except $400, is held by the central Standard Oil Company or Trust. Acceptance of concessions, in the form of low and unlawful freight rates, from the Chicago & Alton road, upon shipments of oil from Whiting, Ind., to East St. Louis, was the offense, and the company was found guilty on 1,462 counts. Under the law, the fine on each count may be any sum from $1,000 to $20,000. Judge Landis imposed the highest fine for which the statute provides. His review of the case and his statement of his reasons consumed a little more than an hour. Then he unexpectedly ordered the calling of a special grand jury, for August 14th, to consider the criminal aspect of these violations of law, the conduct of the other party (the Chicago & Alton Railroad Company), and the evidence as to a conspiracy with respect to the unlawful rates in question. It is predicted that the railroad company will be found guilty, upon the evidence already submitted, and some expect that officers of each of the companies will be convicted of offenses punishable by imprisonment. The Standard Oil Company will appeal to the Circuit Court of Appeals or directly to the Supreme Court at Washington. Against the company there are seven similar cases yet to be tried. These involve 4,422 counts, with respect to which, in case of conviction, the law would permit the imposition of fines amounting to $88,000,000.——In his statement preceding the imposition of the huge fine, Judge Landis reviewed the evidence and considered one after another the pleas of the defense. Referring to his request that the defendant's attorneys should give him information as to the company's earnings, and to their refusal, he remarked that he would waive the question of "the studied insolence" of the language of their answer. He was "unable to indulge the presumption that in this case the defendant was convicted of its virgin offense." Taking up the plea that nobody had been injured because there was no other competing shipper of oil, he said:

"It is novel, indeed, for a convicted defendant to urge the complete triumph of a dishonest course as a reason why such course should go unpunished. Of course, there was no other shipper of oil, nor could there be, so long as by a secret arrangement the property of the Standard Oil Company was hauled by railway common carriers for one-third of what anybody else would have to pay."

"The men who thus deliberately violate the law," he continued, "wound society more deeply than does he who counterfeits the coin or steals letters from the mail." It had been argued by the defendant that to hold it for 1,462 offenses would be a violation of the constitutional prohibition against the imposition of excessive fines. To this he replied as follows:

"It is the view of the court that for the law to take from one of its corporate creatures as a penalty for the commission of dividend-producing crime less than one-third of its net

revenues accrued during the period of violation falls far short of the imposition of an excessive fine, and surely to do this would not be the exercise of as much real power as is employed when a sentence is imposed taking from a human being one day of his liberty. In this connection it may be observed that the figures exhibiting the net earnings of the Standard Oil Company of New Jersey during the period covered by this indictment are exceedingly instructive because of the peculiarly intimate relation between the character of the crime and the revenues of the offender."

Secretary Pratt had testified that the net earnings for 1903, 1904 and 1905, the years in which the offenses were committed, were $199,800,000, and that the dividends paid in those years amounted to $117,603,000, leaving $82,000,000 to be added to the surplus. Dividends declared in the last ten years have been nearly $400,000,000. "Where the only possible motive of the crime," said Judge Landis, "is the enhancement of dividends and the only punishment authorized is a fine, great caution must be exercised by the court lest the fixing of a small amount encourage the defendant to future violations by leading him to regard the penalty as in the nature of a license." He pointed out that the law prohibiting preferential rates was twenty years old, and that when the Elkins law was passed (in 1903) there was an earnest hope that it would put an end to the use of such rates; "and yet, beginning a few months thereafter, the Standard Oil Company procured 1,900 carloads of property to be shipped at an unlawful secret rate." The Elkins law was obviously defective in authorizing punishment only by fine, but it was his duty, he said, to administer the law as he found it rather than to expatiate upon the inadequacy of the punishment authorized for violations of it:

"It is the judgment and sentence of the court that defendant Standard Oil Company pay a fine of $29,240,000."

John D. Rockefeller received the news by a telegram delivered to him on the golf links. He did not permit it to interrupt his game. A statement was published by officers of the company. This is mainly a repetition of the arguments of the company's attorneys at the trial. It asserts that the rate paid was a lawful one, or was issued to the company as a lawful one, and that the company, being not even technically guilty, ought not to have been prosecuted. "If the only desire had been," it says, "to give this defendant a square deal, this prosecution would never have been instituted."

Commissioner Smith's Report

Another long report on the Standard Oil Company and the petroleum industry, by Herbert Knox Smith, Commissioner of Corporations, was published on the 5th. It deals with prices and profits. In a letter submitting it to the President and summarizing its contents, Mr. Smith says it disproves the claim that the Standard has reduced the price of oil. The company, he asserts, "has used its power to raise the price of oil during the last ten years, not only absolutely but also relatively to the cost of crude oil." Proof of this is found in the price tables of the report. Since 1899, the average margin, or difference, between the cost of crude oil and the price of refined has been increased by 1.3 cents a gallon, or from 5.3 to 6.6; and from .7 of a cent to 1 cent yields a good profit. The increase has been much larger for gasoline, lubricating oil and paraffin wax. The average increase of the margin for all the Standard's products from 1899 to 1905 was 1.8 cents a gallon, which would account for a profit in 1904 exceeding that of 1899 by $21,000,000. From 1882 to 1906 the Standard paid $551,922,904 in dividends, and the entire net earnings "were at least $790,000,000." The prices charged by the company are "higher than those which would exist in the absence of such a combination." Railroad discrimination was "the cornerstone on which the Standard's power was first built up," and the company has been "able to maintain in position this primary support of its domination down nearly to the present time," or until the official exposure in May, 1906. It has also used unfair methods of competition. The company's domination has been acquired "not by superior efficiency," but by railroad discrimination and these unfair methods. Concerning the latter there will be an additional report.——The Government's petition in its suit against the Powder Trust was filed in the Federal Court at Wilmington, Del., on the

30th ult., the defendants being 27 corporations and 17 individuals, one of whom is Senator Du Pont. He exercises a dominant influence, the petition says, in the leading company. As to the three great operating companies of the combination, the appointment of receivers is suggested, as in the similar suit against the Tobacco Trust. The combination now monopolizes the production of smokeless powder and controls 95 per cent. of the output of other explosives. This suit is due partly to the efforts of Robert S. Waddell, of Peoria, an independent manufacturer, who has proved, he says, that the Trust exacts from the Government a price yielding a profit of 115 per cent.

Events in San Francisco

In the case of Louis Glass, vice-president of the Pacific States Telephone Company, the jury disagreed, last week, standing seven for conviction to five for acquittal. It was charged in the indictment that Glass, thru the agency of T. A. Halsey, had bribed the Supervisors to withold a franchise from a rival company. Glass will be tried on other indictments. He was defended by Mr. Delmas, recently leading counsel for Harry K. Thaw. All except one of the corrupt Supervisors have resigned, and the men appointed in their places by Mayor Robinson have been installed. Eugene E. Schmitz, recently sentenced to be imprisoned for five years, who claims that he still is Mayor, has appointed fourteen labor union men to fill the vacancies caused by the resignations of as many Supervisors, and these men have accepted their appointments. A decision as to Schmitz's claims will be made by the courts in a test suit instituted by Mayor Robinson's secretary.——The strike of the granite cutters, who have been idle for three months, was settled on the 3d by a compromise. They had demanded an increase from $4.50 to $5.50 a day, and they will receive $5. It is expected that the sandstone cutters, out since May 1st, will compromise on $5.50. They were receiving $5, and they demanded $6. Five hundred telephone girls, on strike for fourteen weeks, will now resume work. They gain an eight-hour day, but no increase of wages. The company will maintain an open shop, but will not interfere with the girls' union. Construction of new buildings has been delayed by the stone-cutters' strike.

Election in the Philippines

At the first election in the Philippines, on the 30th ult., a large majority of the Assembly members chosen were Nationalists. Their party, as well as the party of the Independents, stands for immediate independence, more Filipino employees in the Government service, and a reduction of the salaries now paid to Americans. Complete returns will not be received until about two weeks hence, but the provinces already reporting show 34 Nationalists, 10 Independents and 13 Progressives elected. There will be 81 members in the Assembly. Governor-General Smith says the number of Progressives will not exceed 20. Their party, which had a better organization than any other, is willing to wait for independence until the United States is ready to grant it. They ask for wider public education, a readjustment of the tariff, good roads and an enforcement of sanitary laws. It is stated that the Nationalists and the Independents maintain distinct organizations because of the political ambitions of their leaders. In the Nationalist party there are two factions, each of which had candidates in Manila, where even this division did not enable the Progressives to win. In the first Manila district, Gomez received 1,270 votes and Lukban 1,241. Both are Nationalists. Only 438 votes were cast for the Progressive candidate. In the second district the Nationalists had 3,204 votes (2,096 for Guerrero, the radical editor of the *Renacimiento,* and 1,108 for Delpan), while the Progressives polled only 916. Much has been said about the election of Dominador Gomez in Manila. This man, an energetic agitator, was president of the Workingmen's Union when he was arrested, in 1903, for misappropriating the union's funds and for aiding the insurgents. He was sentenced to be imprisoned for twenty-six months. A receiver appointed by the court had suppressed a paper which he

had been conducting. He resumed the publication of it, and was sentenced to be imprisoned six months for contempt. This sentence was recently confirmed, but execution was stayed. In 1904 he was tried for treason. The court held that the evidence was insufficient, and he was discharged. In 1906 he undertook to procure the surrender of Montalon and several other ladrone commanders, and was successful. It is said that he promised light punishment. The Government said he had no authority to do so. All who surrendered were convicted and sentenced to death. The sentences were confirmed a few weeks ago. Gomez's election is deplored by the Government and by conservative Filipinos. His picture and that of Guerrero were displayed in Manila, after the election, draped in insurgent flags. Press dispatches say that, owing to the result of the election, the ignorant masses expect independence in October next. The more conservative branch of the Nationalist party asserts that half of those voting for Gomez were American negroes. The Philippine Commission will act as a Senate, and no legislation proposed by the Assembly can be enacted without this Senate's concurrence and approval. Many of the Nationalist members were insurgent leaders. Less than 62,000 voters registered, but nearly all of these went to the polls. Twice as many voted at the municipal elections in 1903. Secretary Taft will sail for the islands from Seattle on September 10th.

The Harrisburg Capitol Frauds

Announcement was made on the 30th ult. by John S. Fisher, chairman of the commission appointed to investigate the Harrisburg (Pa.) Capitol frauds, that the commission's report to Governor Stuart would recommend the criminal prosecution of at least five former State officers, two contractors, and other persons. The report contains 71,000 words. It will probably recommend also that civil suits be brought to recover more than $3,000,000 from John H. Sanderson, the contractor to whom about $5,000,000 was paid for furnishings, and from the Pennsylvania Construction Company, which is controlled by Congressman H. Burd Cassel, and to which more than $2,000,000 was paid for metallic files and the like. A report from the expert employed by the investigators says that $412,500 would have been a fair price for the metal furnishings for which $2,072,000 was received by Cassel's company, and that even at $412,500 there would have been a profit of 25 per cent. Documents given to the press by the commission show that Sanderson paid sub-contractors 12 cents a square foot for painting and received $2.52 per foot for the same work, or about $700,000 in all. Sanderson is said to be in Canada. Joseph M. Huston, the architect in charge, who is seriously affected by the charges, has for some time been in the Adirondacks, not far from the Canadian line, in company with his brother, a clergyman. It is asserted that the investigators have obtained possession of several checks representing payments made by contractors to prominent Republican politicians, who say that the sums thus paid were contributions to the campaign fund.

Cuba

Senator Beveridge predicts, in a magazine article, that the Cubans will tear down the Government which the United States will soon assist them to erect, and that the United States, compelled to intervene again, will then retain possession of the island forever. ——Governor Magoon has directed the chief of detectives to put an end to duelling by arresting all challengers. In a recent duel between Napoleon Galvez, a journalist, and Benito Celorio, the son of a prominent lawyer, the former was dangerously wounded.——The new cable line of the Central & South American Company, from New York to Guantanamo and thence to Colon, was opened for service on the 1st. The cost of sending cable messages to Panama has been reduced one-half by the competition thus established.——Small parties of bandits have been attacked and dispersed in the Province of Santiago and elsewhere by the rural guards. The acts of these outlaws have been the subject of much discussion, but they appear to have no political significance.

The Hague Conference

The Hague Conference has now reached its most important stage, and the dispatches that are sent out to the world are becoming more optimistic. Those who have been complaining that nothing was done up to the present moment are now painting rosy pictures of what the world can expect. On Tuesday the cornerstone of the Carnegie Peace Palace was laid "symbolically." We expect to print an article from Mr. Hayne Davis, who is at The Hague, regarding this ceremony next week, so we shall only say that it was a brilliant affair and over 1,000 people were present. It caused considerable comment, however, that Queen Wilhelmina was not present. The greatest achievement at the Conference last week was the acceptance of the American plan for making the Hague Court a more permanent and compact body. This is a great triumph for Mr. Choate, who had the proposition in charge, for all the nations accepted it except Austria, Belgium, Spain, Greece, Rumania, Servia, Siam, Switzerland, Turkey, Uruguay, Luxemburg and Salvador, and these simply refrained from voting. Thus the proposition has past unanimously. As our readers already have been told, this Court will be composed of fifteen or seventeen judges. Disputants will be free to go to it or not, and it will be open to every one. It will meet annually, and the judges will enjoy diplomatic immunity, and will be paid from the joint contributions of all states. Decisions shall be made by majority of the Court, and the judges shall not sit in any case where their own country is concerned. The Court is also an appeal tribunal to which recourse can be had after the findings of commissions of inquiry or of special arbitration tribunals. To give a fair representation in the Court to all countries it is proposed that the judges be appointed for ten years, but this period of time be divided among two or more nations, where a nation on account of lack of population would not be entitled to have a judge for the whole period. Thus Spain and Portugal would have only one judge for five years; Sweden, Norway and Denmark one each for three years; and Servia, Bulgaria, Rumania, Montenegro and Greece one each for two years.——Great Britain and Germany, which have each introduced a proposition for the establishment of an international prize court, have practically agreed on a joint proposition. It is to have the same number of judges as Mr. Choate's permanent court, and it now looks as tho the personnel of both courts would be identical, tho the British-German plan is for the United States, Japan and six of the European Powers to furnish one judge each, Latin America to furnish two, and the remaining to be sent from the other countries represented in the Conference. The prize court will also include two admirals to be furnished by the belligerents, but to be present in an advisory capacity only. Great Britain's proposition to abolish contraband of war has been defeated, altho the vast majority of the nations supported her proposition. The United States, Germany, France, Russia and Montenegro, however, opposed the measure, and Japan, Spain, Panama, Greece and Rumania abstained from voting. In regard to the question of future conferences, the United States and England are both working on this proposition. The United States proposes to have the congress assemble hereafter quinquennially, the diplomats at The Hague to act as an administrative council for the future conferences just as it now acts as an administrative council for the Hague Court, and the Conference on assembling to organize itself. The British plan differs from the American in that the Conference shall meet every seven years instead of five and that it shall be convened by the Queen of Holland instead of by the Administrative Council of the diplomats at The Hague. Leon Bourgeois, who is frequently referred to as the ablest delegate at The Hague, has sounded the keynote of the Conference when he said, "Our purpose is not the pacific organization of war, but the judicial organization of peace."

The Belfast Strikes

The police strike which was ordered for August 3d failed to materialize, owing perhaps to the energetic action of the Government in rushing troops to Belfast. The First Battalion of the Cameron

Highlanders, with a Maxim gun and a detachment of cavalry, were the first to arrive, and they were followed by the Thirteenth Hussars and the Middlesex and Berkshire regiments, making altogether nearly 7,000 troops stationed in the city. Constable Barrett, leader of the mutiny, was dismissed from the force and five other constables active in the movement were suspended. Four hundred constables from various parts of Ulster were brought to Belfast to replace the disaffected men, who will be dispersed to remote rural districts in various parts of Ireland. Constable Barrett, in his public address, claimed that one of the grievances of the force was the fact that under the present Dublin Castle régime only those men who were willing to play the part of provocative agents could gain promotion, and he hoped that the present agitation would put a stop to the "abominable system of manufacturing crime." The police in other Irish cities have shown symptoms of similar disaffection and are agitating for more pay. The negotiations between the employers and the striking carters and dockers have continued, and it is reported that a settlement has been reached in which concessions have been made on both sides. The men gain an increase in pay, but the employers refuse to recognize the union. Claims have been filed against the city to the amount of $150,000 for malicious damages to property during the strike of the dock laborers.——Parliament has passed a grant of $250,000 to Lord Cromer in consideration of his services in Egypt for fourteen years. It received a unanimous vote in the House of Lords and in the House of Commons, with the exception of Socialists and Irish.

The Russo-Japanese Treaty

A treaty has just been signed at St. Petersburg which settles all questions between Japan and Russia concerning commerce, fishery rights, the junction of the Manchurian railroads, the delimitation of frontiers and political relations. The commercial convention expires in 1911 and that relating to the fisheries in 1919. There are no provisions for tariff regulations, but it is understood that the most favored nation clause will cover this. The two Powers mutually guarantee each other's rights and territory, and, except in the Kwan-Tung Province, it is stipulated that the subjects of each shall enjoy equal treatment, equal rights of residence, equality under the law, equal commercial opportunity, without hindrance or discrimination, and that neither shall be subject to special imposts. The fisheries convention embraces the Okhotsk, Yellow Sea and Bering Strait areas. It includes all sea animals, with the exception of the sea otter. The coast is to be mapped into sections, the fishing rights for which will be auctioned publicly to the highest bidder. The Russian Government is obliged to furnish to the Japanese Consul at Vladivostok two months' notice of intention to hold such auctions. The Japanese holders of concessions have the right to cure fish on the beach. Russia makes unusually liberal concessions to Japanese fishing interests on the Russian coast and the Amur River, and it is said that under these privileges Japan will dominate the fisheries of the Pacific. The convention bestows on Japanese subjects the right to fish along the entire coast, with the exception of thirty-four inlets and rivers; to repair their fishing vessels and to erect sheds for the drying of fish in the sun or by fire, and other necessary buildings. The Japanese are to pay the same taxes as Russians, and the export of fish to Japan is made free from all export duty. The Japanese holders of concessions may employ Japanese laborers along the coast, except at the mouth of the Amur River, where they are obliged to employ Russians. In view of the cheap price of coolie labor it is believed that the Japanese will be able to beat down all competition at the public auctions at Vladivostok and become possessed of nearly all the fishing concessions. It is also reported that Russia and Great Britain have come to a complete and satisfactory agreement about all matters in dispute, including the Central Asian spheres of influence, and that a treaty has been signed covering these points.——China has added seven more Manchurian cities to the list of those opened to international trade and residence, making sixteen altogether, in accordance with the requirements of the Japanese-Chinese treaty of 1905.

Anti-Clerical Violence in Italy

In consequence of the newspaper attacks upon the Catholic schools and monastic institutions by the publication of alleged exposures of a frightful state of immorality prevailing in them, serious riots have broken out in many parts of northwestern Italy. Prominent ecclesiastics have been insulted and hissed when they appeared in the streets of the cities. In Milan it was found that a woman, who purported to be a nun, had been running an immoral house under the guise of a home for destitute young girls supported by charity. The woman and two priests, her accomplices, were arrested. The affair aroused anti-clerical feeling to fury, altho the ecclesiastical authorities protested that they had repeatedly denounced the woman and her methods to the police, who had protected instead of suppressing the house. Mass meetings denouncing the corruption of the priests have been held in all the cities of the region. A Salesian college at San Pier d'Arena, a suburb of Genoa, was attacked by a mob with stones. Seven of the priests defended themselves with revolvers, which angered the crowd so that they broke into the building and set it on fire. The priests were with difficulty rescued by the troops. The Salesian Fathers from their college at Varazze had to be locked up in the prison at Savona to protect them from the mob. At Mantua and Spezia churches were pillaged and the sacred vessels and furniture burned in the square. In the fights between the mobs and the police a number of persons have been wounded or killed on both sides. The Director-General of the Salesians has brought suit for damages against the newspapers which published the scandalous accusations. The Government has announced that martial law will be imposed in Northwestern Italy unless the violence comes to an end. The Premier, Signor Giolitti, has issued an order to have church buildings protected by troops and also a thoro investigation made into the alleged exposures. He denies that the Government intends to follow the example of France in suppressing the religious corporations and closing their schools.

Rioting in Morocco

The Moroccan situation has become acute thru an attack made by the tribesmen on Casablanca and the murder of a number of Europeans. Casablanca or Dar-el-Beida is a walled town of 18,000 to 25,000 inhabitants, including 5,000 Jews and a few hundred Christians. It is one of the most important Moroccan ports on the Atlantic coast. On July 30th the chiefs of the Kabyle tribes entered Casablanca and demanded of the Pasha that he put a stop to the construction of the harbor improvements as a foreign and Christian enterprise and an invasion of tribal lands by the railroad. The Pasha replied that he could not stop the work because it was authorized by the Sultan. The tribesmen then declared that they owed no allegiance to the Sultan since he obeyed the Christians. The Pasha, in order to gain time, told them he would give them an answer if they would return the following morning. They returned at that time, but instead of appealing to the Pasha they went thru the city proclaiming a holy war and calling upon the people to massacre all the Christians and Jews. Two Europeans were stoned in the streets and their bodies hacked to pieces. A locomotive that had left the harbor for the quarry a quarter of a mile away was surrounded and the engineer killed by the mob, his native assistant striking the first blow. The French Consul, M. d'Euville, demanded an escort for the recovery of the bodies, but when the Frenchmen reached the spot Moroccan soldiers of their escort threatened to fire upon them, and they were obliged to fly for their lives. It is known that five Frenchmen, two Spaniards and one Italian were murdered, but there may have been others, as all the bodies were thrown into the sea. The harbor shops were looted and burned, and the boats in which the laborers tried to escape were fired upon. The foreigners took refuge in the consulates and the Jews barricaded themselves in their houses or crowded on to the ships in the harbor. The refugees had to bribe the Moroccan soldiers heavily before they were allowed to escape from the town. Dr. Merle was sent by the French Consul in a German steamship to Tangier to ask aid, and the

French cruiser "Galilée" was at once dispatched to Casablanca. An attempt was made to land troops, but as the natives threatened to kill the foreigners as hostages they were withdrawn. Five other French warships and 2,500 troops have been ordered to Casablanca, and Spanish, Italian and British vessels will follow. The Sultan has at last given his consent to the organization of the international police force under French and Spanish control, which, according to the plan devised by the Powers at Algeciras, is to police the ports of Morocco. It may be too late, however, to put the plan in force, if the anti-foreign movement continues to spread and strengthen.——The Sultan's troops are said to have won another victory over the Pretender, Bu Hamara, tho at severe loss to themselves. ——Kaid Sir Harry Maclean is still held as a captive by Raisuli, but the Sultan's troops under Kaid Bagdani are approaching his mountain stronghold from two sides and have defeated the Kmass tribesmen in several engagements. Kaid Mac lean maintains his courage, defying Raisuli openly, refusing to ask for a ransom, and working on the superstitions and fears of the Arabs to induce them to desert Raisuli or surrender him to the authorities.

The Korean Army Disbanded

The Japanese have successfully carried out their plan of disarming and disbanding the Korean army without serious opposition. One battalion attacked the three mounted Japanese officers who appeared at the Little West Gate barracks to demand their arms, but the Japanese saved their lives by quick flight. At the South Gate a Japanese officer and two soldiers were killed. The Japanese returned in force and compelled a surrender. According to the official Japanese report there were 120 casualties connected with the disbandment of the troops. Over a hundred of the Korean soldiers escaped with their arms, but many of these have been captured and imprisoned. About half the army, some 3,000, offered no resistance, marching to the parade ground without arms and receiving gratuities of from $12 to $40 according to rank. One of the Korean officers, on his return to the barracks, committed suicide from chagrin. The Emperor is allowed to keep six battalions of Koreans as a guard of honor. Except for these, the only troops in the country will be Japanese. Prince Tiyong Oui Yi, of the Korean delegation which went to The Hague, has arrived in New York City and is endeavoring to arouse American sympathy for his distressed country.

Advanced Theology in Germany

The current type of advanced theological thought, especially in Germany, differs from all other earlier schools of the kind, by the determination to prove that progressive and new theology can meet and satisfy the religious needs of the people as well as the orthodox can. It is accordingly organizing for the purpose of gaining control of the pulpits and pews of the country and taking in hand all kinds and forms of church work, such as foreign missions, home missions, etc. The Freunde der Christlicher Welt, or liberal associations named after their chief weekly organ, edited so brilliantly by Professor Rade, of Marburg, are found thruout the churches and are engaged in the systematic spread of their convictions. The old Protestanten Verein has been revived and shows unwonted vigor in its work among the masses. An extensive homiletical literature, collections of sermons and the like illustrating the ways and manners in which modern theology preaches, is a marked feature of the newer theological literature, chief among these modern preachers being, perhaps, Lit. Dr. Niebergall, now of the University of Heidelberg. A new journal, called *Evangelische Freiheit*, has just been established, with Professor Baumgarten, of Kiel, as editor, with the official program of demonstrating how advanced theology is to solve the great problems of the hour in State and Church and society. It is accompanied by a Chronik, arranged by Lit. Schiele, of the Marburg University, in which the leading church events are reviewed from the standpoint of this school. In the *Religionsgeschichtliche Volksbücher*, which has appeared in nearly two hundred thousand copies in all, the new theology appeals to the people at large for recognition and acceptance.

Boredom

BY MAXIM GORKY

[The following article is a remarkable proof of the trite saying that what is seen depends upon the eye which sees it. To most people Coney Island, the playground of the metropolis, seems a place of gayety and comparatively innocent tho somewhat vulgar amusements. But to the man who has assumed the name of "Gorky," "The Bitter One," it only affords further evidence of the stupidity and depravity of the human race and of the tyranny of capital. When Maxim Gorky was in this country last summer he seemed to find life and its conditions everywhere as bad as in darkest Russia. Finally, to cheer him up, his friends took him to Coney Island, and this is the impression it made upon his sensitive mind. After reading it one knows better how to interpret his pictures of Russian life.—EDITOR.]

WITH the advent of night a fantastic city all of fire suddenly rises from the ocean into the sky. Thousands of ruddy sparks glimmer in the darkness, limning in fine, sensitive outline on the black background of the sky, shapely towers of miraculous castles, palaces and temples. Golden gossamer threads tremble in the air. They intertwine in transparent, flaming patterns, which flutter and melt away in love with their own beauty mirrored in the waters. Fabulous and beyond conceiving, ineffably beautiful, is this fiery scintillation. It burns but does not consume. Its palpitations are scarce visible. In the wilderness of sky and ocean rises the magic picture of a flaming city.

Over it quiver the reddened heavens, and below the water reflects its contours, blending them into a whimsical blotch of molten gold.

Strange thoughts fill the mind at the sight of this play of fire. In the halls of the palaces, in the radiant gleam of flaming mirth, methinks, strains of music float, soft and proud, such as mortal ear has never heard. On the melodious current of their sounds the best thoughts of the world are carried along like sailing stars. The stars meet in a sacred dance, they throw out dazzling sparks, and as they clasp in a momentary embrace, they give birth to new flames, new thoughts.

I see a huge cradle, marvelously wrought of golden tissue, flowers and stars rocking yonder in the soft darkness, upon the trembling bosom of the ocean.

There at night rests the sun.

But the sun of the day brings man nearer to the truth of life. Then the fiery magic castles are tall white buildings.

The blue mist of the ocean vapors mingles with the drab smoke of the metropolis across the harbor. Its flimsy white structures are enveloped in a transparent sheet, in which they quiver like a mirage. They seem to beckon alluringly, and offer quiet and beauty.

The city hums with its constant, insatiate, hungry roar. The strained sound, agitating the air and the soul, the ceaseless bellow of iron, the melancholy wail of life driven by the power of gold, the cold, cynical whistle of the Yellow Devil scare the people away from the turmoil of the earth burdened and besmirched by the ill-smelling body of the city. And the people go forth to the shore of the sea, where the beautiful white buildings stand and promise respite and tranquillity.

The buildings huddle close together on a long, sandy strip of land, which, like a sharp knife, plunges deep into the dark water. The sand glitters in the sun with a warm, yellow gleam, and the transparent buildings stand out on its velvety expanse like thin white silk embroidery. The effect is as of rich garments thrown carelessly on the bosom of the island by some bather before plunging into the waters.

I turn my gaze wistfully upon this island. I long to nestle in its downy texture. I would recline on its luxurious folds, and from there look out into the wide spaces, where white birds dart swiftly and noiselessly, where ocean and sky lie drowsing in the scorching gleam of the sun.

This is Coney Island.

On Monday the metropolitan newspapers triumphantly announce:

"Three Hundred Thousand People in Coney Island Yesterday. Twenty-three Children Lost."

"There's something doing there" the reader thinks.

First a long ride by trolley thru Brooklyn and Long Island amid the dust and noise of the streets. Then the gaze is met by the sight of dazzling, magnificent Coney Island. From the very first moment of arrival at this city of fire, the eye is blinded. It is assailed by thousands of cold, white sparks, and for a long time can distinguish nothing in the scintillating dust round about. Everything whirls and dazzles, and blends into a tempestuous ferment of fiery foam. The visitor is stunned; his consciousness is withered by the intense gleam; his thoughts are routed from his mind; he becomes a particle in the crowd. People wander about in the flashing, blinding fire intoxicated and devoid of will. A dull-white mist penetrates their brains, greedy expectation envelopes their souls. Dazed by the brilliancy the throngs wind about like dark bands in the surging sea of light, pressed upon all sides by the black bournes of night.

Everywhere electric bulbs shed their cold, garish gleam. They shine on posts and walls, on window casings and cornices; they stretch in an even line along the high tubes of the power-house; they burn on all the roofs, and prick the eye with the sharp needles of their dead, indifferent sparkle. The people screw up their eyes, and smiling disconcertedly crawl along the ground like the heavy line of a tangled chain.

A man must make a great effort not to lose himself in the crowd, not to be overwhelmed by his amazement—an amazement in which there is neither transport nor joy. But if he succeeds in individualizing himself, he finds that these mil-

lions of fires produce a dismal, all-revealing light. Tho they hint at the possibility of beauty, they everywhere discover a dull, gloomy ugliness. The city, magic and fantastic from afar, now appears an absurd jumble of straight lines of wood, a cheap, hastily constructed toy-house for the amusement of children. Dozens of white buildings, monstrously diverse, not one with even the suggestion of beauty. They are built of wood, and smeared over with peeling white paint, which gives them the appearance of suffering with the same skin disease. The high turrets and low colonnades extend in two dead-even lines insipidly pressing upon each other. Everything is stripped naked by the dispassionate glare. The glare is everywhere, and nowhere a shadow. Each building stands there like a dumbfounded fool with wide-open mouth, and sends forth the glare of brass trumpets and the whining rumble of orchestrions. Inside is a cloud of smoke and the dark figures of the people. The people eat, drink and smoke.

But no human voice is heard. The monotonous hissing of the arc lights fills the air, the sounds of music, the cheap notes of the orchestrions, and the thin, continuous sputtering of the sausage-frying counters. All these sounds mingle in an importunate hum, as of some thick, taut chord. And if the human voice breaks into this ceaseless resonance, it is like a frightened whisper. Everything 'round about glitters insolently and reveals its own dismal ugliness.

The soul is seized with a desire for a living, beautiful fire, a sublime fire, which should free the people from the slavery of a varied boredom. For this boredom deafens their ears and blinds their eyes. The soul would burn away all this allurement, all this mad frenzy, this dead magnificence and spiritual penury. It would have a merry dancing and shouting and singing; it would see a passionate play of the motley tongues of fire; it would have joyousness and life.

The people huddled together in this city actually number hundreds of thousands. They swarm into the cages like black flies. Children walk about, silent, with gaping mouths and dazzled eyes. They look around with such intensity, such seriousness, that the sight of them feeding their little souls upon this hideousness, which they mistake for beauty, inspires a pained sense of pity. The men's faces, shaven even to the mustache, all strangely like one another, are grave and immobile. The majority bring their wives and children along, and feel that they are benefactors of their families, because they provide not only bread, but also magnificent shows. They enjoy the tinsel, but, too serious to betray their pleasure, they keep their thin lips pressed together, and look from the corners of their screwed-up eyes, like people whom nothing can astonish. Yet, under the mask of indifference simulated by the man of mature experience, a strained desire can be detected to take in all the delights of the city. The men with the serious faces, smiling indifferently and concealing the satisfied gleam of their sparkling eyes, seat themselves on the backs of the wooden horses and elephants of the merry-go-round and, dangling their feet, wait with nervous impatience for the keen pleasure of flying along the rails. With a whoop they dart up to the top, with a whistle they descend again. After this stirring journey they draw their skin tight on their faces again and go to taste of new pleasures.

The amusements are without number. There on the summit of an iron tower two long white wings rock slowly up and down. At the end of each wing hang cages, and in these cages are people. When one of the wings rises heavily toward the sky the faces of the occupants of the cages grow sadly serious. They all look in round-eyed silence at the ground receding from them. In the cages of the other wing, then carefully descending, the faces of the people are radiant with smiles. Joyous screams are heard, which strangely remind one of the merry yelp of a puppy let to the floor after he has been held up in the air by the scruff of his neck.

Boats fly in the air around the top of another tower, a third keeps turning about and impels some sort of iron balloon, a fourth, a fifth—they all move and blaze and call with the mute shouts of cold fire. Everything rocks and roars and bellows and turns the heads of the people. They are filled with contented

ennui, their nerves are racked by an intricate maze of motion and dazzling fire. Bright eyes grow still brighter, as if the brain paled and lost blood in the strange turmoil of the white, glittering wood. The *ennui*, which issues from under the pressure of self-disgust, seems to turn and turn in a slow circle of agony. It drags tens of thousands of uniformly dark people into its somber dance, and sweeps them into a will-less heap, as the wind sweeps the rubbish of the street. Then it scatters them apart and sweeps them together again.

MAIN PROMENADE, LUNA PARK, CONEY ISLAND.

Inside the buildings the people are also seeking pleasure, and here, too, all look serious. The amusement offered is educational. The people are shown hell, with all the terrors and punishments that await those who have transgressed the sacred laws created for them.

Hell is constructed of papier maché and painted dark red. Everything in it is on fire—paper fire—and it is filled with the thick, dirty odor of grease. Hell is very badly done. It would arouse disgust in a man of even modest demands. It is represented by a cave with stones thrown together in chaotic masses. The cave is penetrated by a reddish darkness. On one of the stones sits Satan, clothed in red. Grimaces distort his lean, brown face. He rubs his hands contentedly, as a man who is doing a good business. He must be very uncomfortable on his perch, a paper stone, which cracks and rocks. But he pretends not to notice his discomfort, and looks down at the evil demons busying themselves with the sinners.

A girl is there who has just bought a new hat. She is trying it on before a mirror, happy and contented. But a pair of little fiends, apparently very greedy, steal up behind her and seize her under the armpits. She screams, but it is too late. The demons put her into a long, smooth trough, which descends tightly into a pit in the middle of the cave. From the pit issue a gray vapor and

tongues of fire made of red paper. The girl, with her mirror and her new hat, goes down into the pit, lying on her back in the trough.

A young man has drunk a glass of whisky. Instantly the devils clutch him, and down he goes thru that same hole in the floor of the platform.

The atmosphere in hell is stifling. The demons are insignificant looking and feeble. Apparently they are greatly exhausted by their work and irritated by its sameness and evident futility. When they fling the sinners unceremoniously into the trough like logs of wood, you feel like crying out:

"Enough, enough nonsense, boys!"

A girl extracts some coins from her companion's purse. Forthwith the spies, the demons, attack her, to the great satisfaction of Satan, who sits there snickering and dangling his crooked legs joyfully. The demons frown angrily up at the idle fellow, and spitefully hurl into the jaws of the burning pit everybody who enters hell by chance, on business or out of curiosity.

The audience looks on these horrors in silence with serious faces. The hall is dark. Some sturdy fellow with curly hair holds forth in a lugubrious voice while he points to the stage.

He says that if the people do not want to be the victims of Satan with the red garments and the crooked legs, they should not kiss girls to whom they are not married, because then the girls might become bad women. Women outcasts ought not to steal money from the pockets of their companions, and people should not drink whisky or beer or other liquors that arouse the passions; they should not visit saloons, but the churches, for churches are not only more beneficial to the soul, but they are also cheaper.

He talks monotonously, wearily. He himself does not seem to believe in what he was told to preach.

You involuntarily apostrophize the owners of this corrective amusement for sinners:

"Gentlemen, if you wish morality to work on men's souls with the force of castor oil, you ought to pay your preachers more."

At the conclusion of the terrible story a nauseatingly beautiful angel appears from a corner of the cavern. He hangs on a wire, and moves across the entire cave, holding a wooden trumpet, pasted over with gilt paper, between his teeth. On catching sight of him, Satan dives like a fish into the pit after the sinners. A crash is heard, the paper stones are hurled down, and the devils run off cheerfully to rest from their labor. The curtain drops. The public rises and leaves. Some venture to laugh. The majority, however, seem absorbed in reflection. Perhaps they think:

"If hell is so nasty, it isn't worth sinning."

They proceed further. In the next place they are shown "The World Beyond the Grave." It is large, and also made of papier maché. Here the souls of the dead, hideously garbed, wander in confusion. You may wink at them, but you may not touch them. This is a fact. They must feel greatly bored in the dusk of the subterranean labyrinth, shut up within rugged walls, in a cold, damp atmosphere. Some souls cough disagreeably, other silently chew tobacco, spitting yellow saliva on the ground. One soul, leaning in a corner against the wall, smokes a cigar.

When you pass by them they look into your face with colorless eyes. They compress their lips tightly, and shiver with cold as they thrust their hands into the gray folds of their rags of the other world. They are hungry, these poor souls, and many of them evidently suffer from rheumatism. The public looks at them silently. It breathes in the moist air, and feels its soul with dismal *ennui*, which extinguishes thought, as a wet, dirty cloth extinguishes the fire of a smoldering coal.

In another place again "The Flood" is displayed. The flood, you know, was brought on to punish the inhabitants of the earth for their sins.

And all the spectacles in this city have one purpose: to show the people how they will be punished after death for their sins, to teach them to live upon earth humbly, and to obey the laws.

Everywhere the one commandment is repeated:

"Don't!"

For it helps to crush the spirit of the

majority of the public—the working people.

But it is necessary to make money, and in the commodious corners of the bright city, as everywhere in the world, depravity laughs disdainfully at hypocrisy and falsehood. Of course the depravity is hidden, and, of course, it's a wearying, tiresome depravity, but it also is "for the people." It is organized as a paying business, as a means to extract their earnings from the pockets of the people. Fed by the passion for gold it appears in a form vile and despicable indeed in this marsh of glittering boredom.

The people feed on it.

The people are always constrained. As yet they have never acted as free men. So they permit the enslavement of their bodies and their souls; for this alone are they to blame.

They pour in thick streams between two lines of dazzingly illuminated houses, and the houses snap them up with their hungry jaws. On the right they are intimidated by the terrors of eternal torture.

"Do not sin!" they are warned. "Sin is dangerous!"

On the left, in the spacious dancing hall, women slowly waltz about, and here everything cries out to them:

"Sin! For sin is pleasant!"

Blinded by the gleam of the light, lured by the cheap, but glittering sumptuousness, intoxicated by the noise, they turn about in a slow dance of weary boredom. To the left they go willingly and blindly to Sin, to the right to hear exhortations to Holy Living.

This aimless straying stupefies the people. But for that very reason it is profitable both to the traders in morality and the venders of depravity.

Life is made for the people to work six days in the week, sin on the seventh, and pay for their sins, confess their sins, and pay for the confession.

The fires hiss like thousands of excited serpents, dark swarms of insects buzz feebly and dismally, and the people slowly wind about in the dazzling cobwebs of the amusment halls. Without haste, without a laugh or a smile on their smoothly shaven faces, they lazily crowd thru all the doors, stand long before the animal cages and chew tobacco and spit.

In one huge cage a man chases Bengal tigers with shots from a revolver and the merciless blows of a thin whip. The handsome beasts maddened by terror, blinded by the lights, deafened by the music and revolver shots, fling themselves about between the iron bars, and snort and roar. Their green eyes flash, their lips tremble; they gnash their teeth in fury, and menacingly raise now one forepaw now the other. But the man keeps shooting straight into their eyes, and the loud report of the blank cartridges and the smart blows of the whip, drive one powerful, supple creature into a corner of the cage. All in a tremble of revolt, seized with the impotent anguish of the powerful, choking with the sharp pang of humiliation, the imprisoned beast sinks down for a moment, and looks on with dazed eyes, his serpentine tail writhing nervously.

The elastic body rolls itself into a firm ball, and twitches, ready to leap into the air, to bury its claws in the flesh of the man with the whip, rend him, annihilate him.

The hind legs of the animal quiver like a spring, his neck stretches, the green irises flash blood-red sparks. The watchful, waiting eyes that blaze in the vindictive countenance confront beyond the bars the dim, coppery blotch of a thousand colorless eyes, set in uniform, yellow faces, coldly expectant.

The face of the crowd, terrible in its dead immobility, waits. The crowd, too, hankers for blood and it waits, not out of revengefulness, but from curiosity, like a satiated, long-subdued beast.

The tiger draws his head in his shoulders and looks out sadly with his wide-open eyes. His whole body sinks back softly, and his skin wrinkles up, as if an icy rain had fallen on a surface heated by the passion for vengeance.

The man runs about the cage, shoots his pistol and cracks his whip, and shouts like a madman. His shouts are intended to hide his painful dread of the animals. The crowd regards the capers of the man, and waits in suspense for the fatal attack. They wait; unconsciously the primitive instinct is awakened in them.

They crave fight, they want to feel the delicious shiver produced by the sight of two bodies intertwining, the splutter of blood and pieces of torn, steaming human flesh flying thru the cage and falling on the floor. They want to hear the roar, the cries, the shrieks of agony.

But the brain of the throng is already infected by the poison of various prohibitions and intimidations. Desiring blood, the crowd is afraid. It wishes, yet does not wish. In this struggle within itself it experiences a sharp gratification—it lives.

The man has frightened all the animals. The tigers softly withdraw into a corner of the cage, and the man, all in a sweat, satisfied that he has remained alive that day, bows to the coppery face of the crowd, as to an idol. He endeavors to conceal the tremor on his pale lips with a smile.

The crowd shouts and claps its hands and sighs—is it relief or is it regret?

Then the crowd breaks into dark pieces, and disperses over the slimy marsh of boredom.

Having delighted their eyes with the picture of man's rivalry with beasts, the human animals go in search of other

LUNA PARK AT NIGHT, CONEY ISLAND.

amusements. There is a circus. In the center of the arena a man tosses two children into the air with his long legs. The children dart over them like two white doves with broken wings. Sometimes they fall to the ground. Then they cautiously look into the blood-suffused face of their father or master, and again ascend into the air. The crowd have disposed themselves about the arena, and look on. When the children slip from the performer's legs, a thrill of animation passes over all the countenances, as a wind sends a light ripple over the slumbering waters of a stagnant pool.

You long to see a drunken man with a jovial face, who would push and sing and bawl, happy because he is drunk, and sincerely wishing all good people the same.

The music rends the air. The orchestra is poor, the musicians worn out. The sounds of the brass instruments stray about as if they limped, as if no even course were possible for them. Even the circus horses, who are used to everything, turn cautiously aside, and nervously twitch their sharp ears, as if they wanted to shake off the rasping tin sounds. This music of the poor for the amusement of slaves puts strange notions into your head. You would like to tear the very largest brass trumpet from the musician's hand, and blow into it with all the power of your lungs, long and loud, so terribly that all the people would run from this prison, driven by the fury of the mad sounds.

Not far from the orchestra is a cage with bears. One of them, a stout brown bear with little, shrewd eyes, stands in the middle of the cage, and shakes his head deliberately. Apparently he thinks:

"All this is sensible only if it's contrived to blind, deafen and mutilate the people. Then, of course, the end justifies the means. But if people come here to be amused, I have no faith in their sanity."

Two other bears sit opposite each other, as if playing chess. Another is busy raking up straw in a corner of the cage. He knocks his claws against the bars. His snout is disappointedly calm. He seems to expect nothing from this life, and has made up his mind to go to bed.

The animals arouse the keenest interest. The waiting eyes of the spectators follow them steadily and minutely. The people appear to be searching for something long forgotten in the free and powerful movements of the beautiful bodies of the lion and panther. They thrust sticks thru the gratings, and silently experimenting prod the animals' stomachs and sides and tickle their paws, and look to see what will happen.

The animals that have not yet become familiarized with the character of human beings are angry. They thrust their paws against the bars, and roar. This pleases the spectators. Protected from the beast by the iron grill, and assured of their safety, the people look calmly into the blood-shot eyes and smile contentedly. But the majority of the animals pay no heed to the people. When they receive a blow with a stick, or are spat upon, they slowly rise, and without looking at the insulter retire into a distant corner of the cage. There the lions, tigers, panthers and leopards couch their beautiful, powerful bodies. In the darkness their round irises burn with the green fire of scorn for mankind. And the people glancing at them once again walk away, saying:

"Uninteresting!"

A brass band plays desperately at a semi-circular entrance, a kind of dark, wide-gaping jaw, within which the backs of chairs stare like a row of teeth. In front of the musicians is a post to which a pair of monkeys are tied by a thin chain. It is a mother and her child. The child presses closely against the mother's breast, and its long, thin hands, with their little fingers cross over the mother's back. The mother encircles the baby in a firm embrace with one arm. The other is cautiously extended forward, its fingers nervously crooked, ready to seize, to scratch, to strike. The mother's strained, wide-open gaze clearly bespeaks impotent despair, the anguished expectation of unavoidable insult and injury, melancholy rage. The child has nestled its cheek against its mother's breast and looks slantwise at the people with cold terror, motionless, hopeless. Apparently it has been filled with dread from the first day of its life, and the dread has frozen and congealed

in it for all days to come. Displaying her white teeth the mother, without for a second removing the hand that clasps the child of her flesh, continually rebuffs the canes, the umbrellas, the hands of the onlookers, her tormentors.

The spectators are many. They are all white-skinned savages, men and women in straw hats and hats with feathers. It is fearfully amusing for all of them to see how skilfully the monkey mother shields her child from the blows they aim at its little body.

The mother quickly turns on a smooth space the size of a plate. She risks falling any second under the feet of the crowd, but she tirelessly repels everything that threatens to come in contact with her child. Sometimes she does not succeed in warding off a blow, and then she shrieks out pitifully. Her arm quickly cuts the air like a lash, but the onlookers are so many, and every one desires so much to pinch, to strike, to pull the monkey by the tail or by the chain around its neck, that sometimes she misses. Her eyes blink thoughtlessly, and radiate wrinkles of injury and distress appear around her mouth.

The child's hands squeeze her bosom. It clasps her so firmly that its hands are almost hidden in her thin hair. It has sunk down motionless, and its eyes stare fixedly at the coppery blotch of the faces all around.

Sometimes one of the musicians turns the stupid, brass bellow of his instrument upon the monkey, and overwhelms the animal with a deafening noise. The little baby timidly clasps the mother's body still harder, shows its teeth and looks at the musician sharply.

The people laugh and nod their heads approvingly to the musician. He is satisfied and a minute later repeats the feat.

Among the spectators are women, some apparently mothers. But no one utters a word of protest against this cruel fun. All are satisfied.

Man is nurtured on terror, so he endeavors to inspire others with terror of himself. But he arouses only disgust, the poor, unfortunate wretch!

This torture continues thru the whole long night and part of the morning.

Alongside the orchestra is the cage of an elephant. He is an elderly gentleman with a worn, glossy skin. He thrusts his trunk thru the grating and swings it with serious mien. He looks at the public, and, good wise animal that he is, he thinks:

"Of course, these scoundrels, swept together by the dirty broom of tedium, are capable of making sport even of their prophets. So I've heard old elephants tell. But I'm sorry for the monkey, any way. I've heard also that human beings, like jackals and hyenas, sometimes tear one another to pieces. But that's no consolation to the monkey."

You look at the pair of eyes in which is depicted the grief of a mother powerless to protect her child, and at the eyes of the baby, in which the deep, cold, dread of man has congealed into immobile rigidity. You look at the people capable of deriving amusement from the torture of a living creature, and turning to the monkey, you say:

"Little beast, forgive them! They know not what they do. They will become better in time."

Thus, when night comes, a fantastic magic city, all of fire, suddenly blazes up from the ocean. Without consuming, it burns long against the dark background of the sky, its beauty mirrored in the broad, gleaming bosom of the sea.

In the glittering gossamer of its fantastic buildings, tens of thousands of gray people, like patches on the ragged clothes of a beggar, creep along with weary faces and colorless eyes.

Mean panderers to debased tastes unfold the disgusting nakedness of their falsehood, the *naïveté* of their shrewdness, the hypocrisy and insatiable force of their greed. The cold gleam of the dead fire bares the stupidity of it all. Its pompous glitter rests upon everything 'round about the people.

But the precaution has been taken to blind the people, and they drink in the vile poison with silent rapture. The poison contaminates their souls. Boredom whirls about in an idle dance, expiring in the agony of its inanition.

One thing alone is good in the garish city: You can drink in hatred to your soul's content, hatred sufficient to last thruout life, hatred of the power of stupidity!

CAPRI, ITALY.

The Latest Art Treasure in Rome

BY ARTURO CALZA

Minister of Instruction

ON the shore of the Tyrrhenian Sea, at an extremity of Lazio, between Civitavecchia and Gaeta, rises a town whose origin is lost in the mists of antiquity, the pleasant retreat in summer thru the ages of a large colony of Romans. Porto d'Anzio, the ancient city of the Volsci, was founded, according to tradition, by Antias, son of Ulysses and Circe; indeed, it stands not far from the magnificent Mount Circeo, where the famous sorceress kept Ulysses prisoner, and on the summit of which some majestic and imposing ruins are still called the "Palace of Circe." Anzio was ever unfaithful to the Romans during the whole of the Republic, and in the league of the Latin sisters against the Eternal City, the antique Volscian city, whose inhabitants were animated by a high conception of liberty, was always at the head of the separatist movement, Rome inflicting many times most severe punishment on the rebel colony.

On the pacification of the country under the Emperors, Anzio became a delightful resort, and after two of the most famous of the Roman Emperors saw the light of day within her walls, she acquired even greater splendor. Caligula was born there August 31, 12 A. D., and Nero, December 15, 37 A. D. Nero, especially, was very fond of his native town and went there often, passing several months at a time at his villa. He was in Anzio when the fire which destroyed half Rome and which led to the terrible persecution of the Christians broke out, while it was at Anzio that he ordered the attempt on his mother's life at sea to be carried out.

"*O Diva gratum quae regis Antium*," exclaimed Horace, and neither the verse nor the praise of the poet were exaggerated. Coming out of the wood which surrounds the town on the inland side, and thru which the modern road leading to the town passes, a magnificent scene is presented. To the west rises the promontory of Anzio, before which opens out a smiling bay which terminates at the mouth of the Tiber, more than 40 miles away; toward the east is the little island of Astura, where, in the fourth century, the famous battle of Rome against the Latin League was fought, and where, many centuries after, Corradino, the last flower of his house, was taken prisoner; further on is the imposing peninsula of Mount Circeo, which recalls the most ancient legends of Italica, where Cicero, the prince of Roman orators, had a sumptuous villa.

In this enchanting spot Nero built an imperial residence, described by Svetonius, and of which there are still many notable remains. Just overlooking the sea, and now called "Arco Muto," are precious ruins of this villa, not only for their memories, but also because there, in the time of Pope Julius II, was found that great masterpiece of Grecian art which was afterward called the Apollo Belvedere. In still later times from these ruins emerged the famous Gladiator now in the Diocletian museum, and only a few years after another incomparable work of antique sculpture came from the Neronian villa,, returning after so many centuries to astonish the world. The singular and romantic circumstances under which this last discovery came to light contributed to render it, if possible, even more interesting.

The night of December 26, 1878, the wind rose and lashed the sea into enormous waves, which broke on the promontory of Anzio toward the "Arco Muto," where, as we have already said, the imperial villa rose twenty centuries ago. The impetus of the sea bore away earth, sand and stones, so that the morning after the first rays of the rising sun revealed to the astonished inhabitants of the village new walls of a large hall, and in a niche, standing erect, the statue of a maiden in all its pristine beauty of line and color. This work was examined by

the most celebrated connoisseurs in Rome, who pronounced it to be of undreamed of beauty. The statue in Greek marble, white and little transparent, is five and a half feet high, and rests on a plinth which in Roman times evidently stood in a hollow base. The statue is formed of two pieces, one including the whole body from the upper hem of the drapery to the feet, the other the head and the right shoulder. On the whole it is well preserved, the extreme tip of the nose, the right forearm and a part of the left arm only being missing. There is also lacking half of the plate she is carrying, which was resting on the left forearm, and several of the objects which were upon it. The motive of the statue is singular and absolutely unique among the antiques which have come down to us. It represents a young woman clothed in the *chiton*, which has slipped from the right shoulder and which, with the high girdle, supports the breast. She also wears a mantle which drapes the figure and is wound about the waist in such a way as to scarcely cover the hip, and passing to the left side is apparently held in place by the elbow. The girl rests on her left foot, while the right leg, free and straight, seems in the act of taking a quick step forward. The head is inclined to the left shoulder, with the eyes fixed on the objects which she is carrying.

THE ANZIO STATUE.

On the plate is a roll which was at first believed to be a parchment or papyrus, but Professor Furtwängler has demonstrated with absolute certainty that it is a rolled sacrificial band. This interpretation, the importance of which, as we shall see, is very great for the solving of the mystery of the subject of the statue, is justified not only by the form of the roll and the concavity of the ends, but also by its size. There is also on the plate a branch or wreath of laurel or olive, and a small base on which is the paw of a wild animal and the beginning of another; thus evidently this plinth supported a little tripod. Altho the left arm is missing, the use to which it was put is easily understood, helped by fragments of laurel which were found near the figure. It is abundantly evident that she was in the act of either laying down or raising a wreath of laurel or olive. From the movement of the girl it is seen that the statue was conceived in relation to another figure which probably was meeting her. In the work of the drapery and especially in the distinction between the *chiton* and the mantle, the artist showed a really singular ability, and it is worthy of note that the whole figure, even down to the folds of the draperies, is executed in such a way that the eye is always attracted to the point on which the girl's attention is concen-

trated, *i. e.*, the objects on the plate. It cannot be said that the artist has made the drapery more important than the body, but at the same time it certainly is not less so. The sculptor, however, has revealed all his art in the beautiful head of the girl. It is slightly turned, as I said before, toward the left shoulder, while the hair, not too voluminous or too long, but smooth and light, is arranged with great simplicity, rolled above the ears from the back of the neck to the forehead, the head in this way joining the neck without sharp lines. The oval of the face, pure but not too long, the forehead smooth but powerful, the chin strong, and the eyelids accentuated, give to this face a something not masculine, but still scarcely feminine; something which, preserving the lineaments of a feminine figure, renders it firm and strong, taking away all delicacy and softness.

In the whole figure the beauty of the composition is equaled by the perfection of the material execution. The sculptor knew how to get from the marble every shade of difference between hair and flesh, between flesh and drapery, and knew how to gain effect cleverly, concentrating the greatest care and diligence on the dominant parts, leaving the others in shadow, which reveals the sure and mature artist who has executed an original work.

Not even the most illustrious art critics have attempted to give a name to the author of this masterpiece. Only Professor Klein has suggested Praxiteles, while Professors Altmann and Amelung have demonstrated that it is impossible to name him, because the statue is something new, really original at the time of its creation, so that it can only be designated as one of the best Greek works, especially among those of Asia Minor. Others, among them the illustrious Professor Loewy, think it should be put down to that great period of art which flourished in Rome at the beginning of the Empire, to which period the studied elegance of the work belongs, a classical reminiscence of the art of Praxiteles. If this hypothesis were true the value of the Anzio statue would be greatly added to, given the increasing importance which the art of the Roman period, until now so obscured, is taking every day in the study of art and archeology, and given also the scarcity of original works of the beginning of the Empire.

What does the statue represent?

This question has been left to the last because of its difficulty and the controversies over it. With this statue all is mystery—the way in which it came to light, the sculptor, and what it represents.

Professor Rosa, the well-known antiquarian, who was the first to see and appreciate the statue, judged it to be a priestess of the worship of *Fortuna Gemina Anziate*, a divinity which, as is seen by the name, had a temple at Anzio and a special worship.

Altmann sees in it a priestess of Apollo of Patara, in Licia, attributing the remains of the little feline paw to the small figure of a lion, the animal sacred to that god; but as there are indubitable signs of the remains of a tripod this interpretation cannot be sustained.

Amelung contends that it is a poetess in the act of consecrating her crown of victory to a divinity, but he began with the hypothesis that the object on the plate was a roll of parchment, which further study showed to be untenable.

The fact is that the sacred emblems are completely wanting to this figure, and it is only a superficial observation which could have pronounced them to be such.

Can the statue instead be, for example, a Sibyl? This cannot be totally excluded, but in this case the attributes which are known to us in the most celebrated statues and pictures of the Sibyls are lacking.

Furtwängler, acknowledged by all as most competent in art criticism, from his belief that the roll on the plate is a sacrificial band, deduces that the statue represents a sacrificial figure or an attendant at the sacrifice; and this opinion is confirmed by other signs—the form of the sandals, composed of a sole and strap, which is too simple and modest for a priestess or a poetess; also one foot is quite free from the drapery with a certain carelessness, the *chiton* leaves the shoulder bare, and the mantle is rolled about the waist without any preoccupation as to elegance; it would seem almost

that the artist had taken special pains to demonstrate that his figure was walking and moving without impediment. All these points apparently prove that the illustrious German archeologist is in the right, and that the Anzio statue does not represent, as has up to the present been supposed, a priestess, who would have been in a more solemn and dignified pose, but one of the virgins attached to the sacrifice, who, because of her office, has to be quick and ready with the sacrificial attributes for the priest or priestess. This hypothesis explains the position of the right forearm and the concentration of the attention of the girl on the plate; she was perhaps lifting a crown or olive branch for the one who was sacrificing to the god, and as the virgin had no office other than to help and supply the objects of the cult, she shows her earnestness in the action.

Finally, it may be added that the beautiful statue owned by Prince Lancellotti, who is the proprietor of the land where it was found, was to have been bought by the Italian Government for 450,000 francs, but now some difficulties have come to the front, as it seems that the Government itself claims the statue, saying that it was found on the shore and that the shore belongs to the state.

ROME, ITALY.

Concerning King, Lords and Commons

BY JUSTIN McCARTHY

JUST at present the attention of the public in these islands is turned for the most part to the visit of King Edward and Queen Alexandra to Ireland. The welcome given to the King and Queen everywhere during the visit has been of the most enthusiastic nature, and I feel well assured that the enthusiasm is, on the whole, not merely genuine, but actually national in its character. There may, of course, be sections among the Irish population who have grown into a positive distrust of everything British, and a feeling that an English monarch can only be a representative of England's oppression directed against Ireland. But these sections, I feel well assured, are very limited in numbers and in influence, and I am convinced that among the great mass of the Irish population, and even of the Irish Nationalists, there has always been a firm hope that with King Edward's coming to the throne there has come a sovereign whose sincere purpose it is to make Ireland a free, contented, and prosperous partner in the British Empire. The large majority of the Irish people would be well content with such a partnership, a partnership like that which Scotland has long enjoyed, like that which is now enjoyed by the Canadian and Australasian colonies. Ireland demands, has long demanded and will soon have with the full sanction and approval of King Edward VII, a National Parliament for the domestic government of her own people by the legislation of her own representatives. I cannot but believe that the establishment of such a Parliament will meet with nothing but approval from the present sovereign of this Empire. There is a general feeling of the same kind thruout the great mass of the Irish people, and we are all inclined to regard the present visit of King Edward as auspicious of some such near solution of our national troubles.

Just before starting on his visit to Ireland, King Edward performed an act which cannot but be regarded as an indication of a sympathy with Irish National sentiment even where that sentiment has now and then made itself known by acts of direct opposition to existing British laws. The King sent a complete pardon to Arthur Lynch, the distinguished and highly gifted Irish Nationalist who fought against England in the South African War, was sentenced to

death in consequence, but was released from the extreme penalty of the law, was imprisoned for a term of years, and afterward held in a sort of mitigated captivity. The King has now as a prelude to his Irish visit given to Arthur Lynch his full and absolute freedom. No one can possibly doubt that when King Edward proclaimed this act of pardon he did so with the object, among other objects, of expressing to the people of Ireland his hope and his belief that the causes for rebellious movements in Ireland belong already to the past. I feel therefore well assured that the King and Queen will be met all thru Ireland with an enthusiastic welcome.

THE KING.

Every educated and intelligent Englishman is now ready to admit that the government of Ireland by England down to the accession of Queen Victoria and even for some years after was such as must have kept in constant rebellion any people who did not "lack gall to make oppression bitter." I do not need to go over the old sad story of that oppression, and I only touch upon it with the object of showing that England always had it in her power to make Ireland a contented sharer in her imperial system, and that the time has now arrived when the sovereign and the great majority of the English people are desirous that such a free and contented partnership shall be established. King Edward has, of course, when Prince of Wales, paid several visits to Ireland before, and was always well received there, but his going to Ireland at the present time is significant of a meaning and purpose entirely different from any which it could have had while he was not yet the crowned representative of the Empire.

The whole course of political movement in Great Britain and Ireland has undergone a change destined to be memorable in our history, a change of which it is impossible as yet to foreshadow the full influence. That change is found in the formation of an independent and a powerful Labor party inside the House of Commons. We have had for many years some representatives of labor in that House—we have had these since the extension of the franchise gave to workingmen the opportunity of voting for a candidate of their own choice and of their own order. But only of very recent years has there been established in the House of Commons a regular avowed and independent Labor party considerable enough in numbers to affect any party division in the House and acting when occasion requires with especial or even with exclusive regard to the interests of their own order. Such a party is now prominent in the House, and it acts as independently of all other parties as the Irish Nationalists do, and it makes its influence felt on the constituencies and on the country as well as on the parliamentary assembly.

A remarkable illustration of this new influence was given lately in the case of the Jarrow election, where four candidates were set up in contest, one representing the Liberal party, a second the Conservatives, a third the Irish Nationalists, and the fourth the Labor party. Every effort was made by the leaders of

those several parties to win success for their candidate. The Prime Minister recommended the Liberal candidate; Mr. John Redmond spoke for the Nationalist; the Conservative leaders did all they could for the man of their own political views, and when the poll was taken it was found that the Labor candidate had been elected by a decisive majority.

It has to be borne in mind by observers in general that there is nothing revolutionary, according to the ordinary and more formidable sense of the word, in the purposes and the demands of the Labor party. It is not necessarily a Socialist party, nor does it proclaim or suggest any projects of attack upon throne and altar or upon private property such as one would naturally associate with the representatives of the laboring masses in some Continental political movement.

One of the most distinguished, most influential and most capable representatives of the Labor party is John Burns, who now holds an important place in the Cabinet of the present Liberal Ministry. Everybody who knows John Burns or knows anything about him must feel well satisfied that laws worth having and order deserving of the name could not have a more sincere supporter than is found in him.

THE QUEEN.

But none the less do we find a memorable era created in our whole system of administration by the existence of an independent and a cohesive Labor party established in our representative assembly. I need perhaps hardly tell my readers that I for myself regard the upcoming of this new party with gratification, with hope and with confidence. The interests of the working classes were left too long in our legislative system to be merely the care of the enlightened, high-principled and far-seeing few who could turn their attention and give their support to those interests as they might do to any other philanthropic work. Now and henceforward the interests of the working classes may be trusted to take care of themselves, and they will make their claims an important condition, a condition which cannot be left out of account, in every election and in every political movement.

Thus far the interests of labor have received but small encouragement, where political interests are concerned, from the Conservative party, but I cannot help believing that the Conservatives will soon find it convenient to make some efforts toward securing the help of the Labor party in this or that division in the House of Commons or election in one of the constituencies. We see the opening of a new political era.

The Liberal Ministers have their work very distinctly cut out for them during the approaching sessions. That work, indeed, has been announced and proclaimed from the hour of their coming into office, but we have learned lately what the precise course of action is to be. The next two sessions we are explicitly given to understand will see the work disposed of one way or other for the time, and then comes the appeal to the country. The Government proposes in the next session to deal with the licens-

ing laws, concerning which there is certain to be an impassioned struggle between the advocates of temperance and all those, the brewers, the distillers and the publicans, whose interests are involved in the making and the selling of wines and spirits and ales, and I need hardly say that among the brewers and distillers are many men of great wealth and widely spread influence.

Then in the following session the Government will enter definitely on the policy which is directed toward the abolition of the controlling power exercised by the House of Lords over the decisions of the representative chamber. On the result of this effort, whatever that immediate result may be, the Government will appeal to the country and ask the constituencies of these islands whether or not they approve of that policy. Even tho the Government policy should be sustained, as it unquestionably will by a great majority in the House of Commons, Sir Henry Campbell-Bannerman and his colleagues are none the less determined to give the whole electorate of these kingdoms an opportunity of at once pronouncing upon it. There hardly can be any doubt that the constituencies will emphatically sustain the policy of the Liberal Government, and the result will be that this country will at last be set free from the over-ruling power of a second chamber, which is absolutely irresponsible to the people of these countries. The House of Lords will then become in some form or other just such a Senate or second chamber as most other countries have, a Senate directly responsible to the sovereign authority of the people. The Government of the Liberal statesmen who accomplish this great change in our legislative system will be at least as memorable in history as that of the government who compelled William IV to pass the great reform measure of 1832.

I have seen a letter addressed to the editor of THE INDEPENDENT by a Scottish gentleman who finds fault with my using the words "England's Parliament" and the "English Parliament" to describe our legislative institution. The writer contends that there is no such thing as an English Parliament, and that it ought to be spoken of as the British Parliament, inasmuch as it represents Scotland as well as England, and that it ought therefore to be described as the British Parliament. I quite admit that the words "English Parliament" do not strictly and properly describe our legislative institution, but then the writer of the letter seems to forget that "British Parliament" would also be an inadequate description. The official title of our legislative body is "The Imperial Parliament of Great Britain and Ireland," and my critic will see that his phrase "British Parliament" is likewise an inadequate and imperfect title. The truth is, however, that I wrote according to the fashion we adopt in ordinary speaking and writing and without taking the pains to use terms of strictly technical accuracy. My American readers I well knew would quite understand what was meant by "England's Parliament," and would not for a moment imagine that I was wilfully neglecting the rightful claims of Scotland and of Ireland.

I mentioned in my last letter that Messrs. Chatto & Windus had just published a new volume of their series of Color Books. This volume, called "The Color of London," is illustrated by the Japanese artist, Yoshio Markino. It has an introduction by M. H. Spielmann, the well-known art critic and author of many books on art. The book itself is written by Mr. W. J. Loftie, and gives an extremely interesting account of London from early times to the present. The pictures by the Japanese artist are wonderfully clever, and reproduces exactly both the color and the atmosphere of London—the peculiar atmosphere, the haze, which seems over everything there quite apart from fog or mist, and which sometimes makes the color look even more vivid. It has a beauty of its own quite distinct from that of any other great city, and nowhere have I seen it better conveyed than in some of these pictures. The essay by the artist himself is one of the most interesting impressions of London I have read. He has a great appreciation of our metropolis and much sympathy with its history and its people, and even the few criticisms he makes are in a sympathetic spirit. The essay is charmingly written, and adds greatly to the interest of this book.

LONDON, ENGLAND.

Our Co-operative Country Home

BY MILES ROBERTS

AS the population becomes each year more and more congested in the cities and the demands of business and social duties more exacting, the necessity for relaxation and rest is increasingly apparent. Thus it has come about that almost every other person one meets is looking for a place in the country where he can get away for a time and enjoy what Nature has in store, without a thought for the demands of business or society, or even of the daily newspaper. While these changes are going on in the city, the exact reverse is true of the country districts. The hills of New England and Northern New York are being abandoned by the tillers of the soil to such an extent that the price of farm lands has been steadily going down, until now in many places large tracts of land can be had with good buildings on them at $4, $5 and $6 per acre, so that it would seem that all who desire may have homes of their own for the summer months amid attractive surroundings.

The trouble and expense of keeping up an individual place, however, is so considerable that the writer and four friends, after carefully going over the matter, decided to try a co-operative camp. We located at Tolland, Hampden County, Mass., where we found a township having an area of upward of 18,000 acres with a population of some 250 persons and less than 50 voters in the entire township. The country is rolling, with an elevation of from 1,400 to 1,800 feet above sea level, covered largely with growing timber of white pine, sugar maple, hemlock, beech and oak, with an abundance of mountain laurel and blueberries on the upland pastures. Here we found one of the prettiest of mountain lakes, covering an area of some 300 acres, around which we bought 1,300 acres of land, at a cost of but $5 per acre. There was a good farmhouse on the property, with barns and other buildings, all in good repair. Another house and barn near the lake were also purchased, and these were converted into a comfortable tho modest clubhouse, at an expense of some $1,200. This afforded ample accommodation for several years, as not more than two families were ordinarily at the camp together. Some members would be there for trout fishing in the spring; others for the summer vacation or for the fall shooting; while others enjoy fishing thru the ice for pickerel or the winter sports of sleigh riding, snowshoeing and tramping thru the fields and forests for partridge or hare, or for the mere love of the country and the wildness and restfulness of the place.

Last summer, however, three other friends were invited to join the camp, making eight members in all, and as additional accommodations had to be provided, the time seemed ripe for carrying out the original plan of having individual lodges. Accordingly, three bungalows are being built by members on the shores of the lake, another on a mountain top four miles away, and the trees are already cut for a log cabin, to be built in the autumn. The houses will all contain large fireplaces, which are much appreciated on rainy days and cool evenings, and will cost from $750 to $2,000 each, the former for a two-story shingled bungalow, 26 feet by 30 feet, with an 8-foot veranda on three sides, built without a cellar. Native pine and hemlock are used in the construction, except for the flooring and partitions, which are of North Carolina pine. The rooms are not ceiled, the studs and sheathing boards being simply planed and stained. The latter builds a house, 30 feet by 53 feet, ceiled thruout, with cemented cellar walls and native beech flooring.

Our first purchase was made seven years ago. Since then the preserve has been enlarged to upward of 3,000 acres, and the individual members have acquired nearly as many more, making a total area of some 6,000 acres, or over

NEAR SPRINGFIELD, HAMPDEN COUNTY, MASS.

The land around this lake, 1,500 feet above sea level, cost $5 per acre. Here we found one of the prettiest of mountain lakes, covering an area of 300 acres, around which we bought 1,300 acres of land.

9 square miles of territory. These were purchased at prices varying from less than a dollar up to $6 an acre, with the exception of one farm of 60 acres, which it was necessary to obtain to round out the tract, and that fact known to the owner; $800 was paid for this piece. One tract of 280 acres was bought at a sheriff's sale for $250; another farm of 300 acres that formerly kept sixty head of stock was actually abandoned by the owner, and one of the club members got it for the preserve for the amount due on the mortgage—about $1,200. Another farm of 300 acres was bought for $400, and after selling enough standing timber from 15 acres of it to pay for the place, the club sold the farm itself for $1,200 to one who appreciated the view which it commanded. This farm was detached from the rest of the tract and therefore not required for the preserve. Another farm of 350 acres was bought for $800, with a good house on it, and others at similarly low prices, tho $4 and $5 were about the average prices paid. Some of these farms have since been sold or traded off, until the estate is now in one compact tract surrounding the lake. Here we are endeavoring to build up a great white pine forest and game preserve, where we can go with our friends at all seasons of the year for rest and recreation, at a minimum of expense.

As the simplest way of holding title to and managing the property, a corporation was organized under the laws of the State of New York, our home State, and the necessary officers and directors elected, all of whom serve without salary. Each member subscribed for five shares of stock, which gave an ownership of $500 in the property, in addition to which he pays $10 semi-annual dues, and is given a deed to a camp site if he cares to build. Board and produce from the farm are furnished at cost. A garden is planted each year, and the camp has its own dairy, horses, oxen and farm utensils, as well as maple sugar and

syrup from the sugar bush. An ample supply of ice is gathered, the streams and lakes are stocked with fish, and everything possible is done for the convenience and comfort of members and their guests, who naturally become more and more attached to the place each year. They enjoy the freedom and complete absence of everything that reminds one of the city; they like to ride and boat; to wander thru fields and woodland paths or stroll along the shaded shores of the lake; they love the birds and trees and know many of them by name; they enjoy searching for rare flowers, mushrooms and mineral specimens. They delight to view the fields of laurel in full bloom, the great white birches by the lake, the sugar maples towering a hundred feet overhead, the stately pines and hemlocks, the smooth gray trunks of the beech, the fiery red berries of the mountain ash and holly, the coloring of the foliage in the autumn. They love the rocks and hills, the lake and streams. They enjoy it all, and the more so because they have an ownership in it. Wood roads are being cleared thru the forests and around the lake, as the men have time to spare from other work, to serve as drives and bridle paths, as well as to make easy access to all parts of the preserve. A few acres of young pines have been planted at a cost of about $8 per acre, in addition to the large tracts of natural pine forests. The latter are being thinned under the direction of competent foresters, sent out from the Bureau of Forestry of the Department of Agriculture, without expense to the owners. These thinnings are made for the good of the forests, and to make them more attractive as well, as the removal of some of the trees gives more light to those remaining and enables them to grow more rapidly and to more perfect form. These thinnings are made whenever the timber to be cut out is of sufficient value to pay a profit over and above the cost of removal. In one grove of pine 25 per cent. of the trees were taken out, and these produced a net in-

come of $4 per 1,000 feet board measure. Such thinnings will be continued each year, and should yield an ever-increasing revenue, until a net annual return of at least $2 or $3 per acre from all properly treated forest lands is reached. Some of the best of the land is kept in grass and pasture, but the greater part is allowed to grow up to forest, which in the long run is the most profitable use to which it can be put. Timber today is worth almost twice what it was when the first

Built of native stone with a rough hewn log of red maple as a mantel.

purchase was made, and the price will certainly make even greater advance because of the ruthless way in which the forest-covered hills of the country are being denuded; yet these farms can be bought today as cheaply as then, tho the timber on them is worth double.

To the farmer who is advancing in years the constant fight against the encroachment of bushes and forests on the pastures and meadows is a hard one, and he finally gives up the unequal task and offers his farm for sale, often for less than the timber on it is worth, for the average farmer knows little of the value of standing timber. And then, too, as one family sees a neighboring farm sold and the home broken up, they, too, want to sell, with the result that these hill farms are the more rapidly being abandoned. What is to be the future of these places? Plainly one of two things. Either the foreigner is to come in and occupy them, as he has already done in many other places, or they are to become the recreation ground for the residents of the cities, and especially for those who spent their childhood days among the hills and are ever glad to return whenever opportunity is presented. To these what matters it if the roadsides do grow up to bushes? It makes driving all the more delightful. If old houses become abandoned and untenantable they are easily taken down or sold for what the timbers in them are worth, and lilac and raspberry grow up around the spot, and with a clump of cinnamon

roses or a bed of tansy are soon the only reminder that a house once stood there, for nature quickly heals all wounds. What if the old back pasture or the meadow does grow up to pines? It can produce nothing more profitable or that more delights the eye. What if the old family burying-ground does grow up to balsam fir, seeded from trees planted years ago by loving hands? Is it not in keeping with the rest of the landscape and emblematic of rest? What if the hill pastures do grow up to blueberries; can anything be more luscious than those berries when picked and eaten off the bushes after a tramp thru the fields?

Such is Tolland—an ideal spot for a summer vacation—a place that becomes more attractive to the nature lover each year, where there is not a store, saloon or public house of any kind, other than the one-room town hall and the meeting-house on the top of the hill, where nature is taking possession of everything, where the winters are long and bleak, and the snow comes early and stays late, where the summers are delightfully cool. Who shall say that this last is not what these hills are best fitted for? The members of the camp believe it is, and are solving for themselves the problem of the summer vacation for the whole family. Each member has his own cabin or bungalow if he likes, as well as the use of the club house, and the farm house is always open for the children who desire to spend a holiday there. A competent superintendent, with the necessary assistants, look after the place, the planting of gardens and field crops, the care of the dairy and horses, the gathering and selling of products, or the shipment to members of apples, potatoes, maple syrup and sugar, or other winter supplies. He is always on the place to care for the buildings and look after the thousand and one things on a large estate, all of which is left as nearly as possible as nature made it.

We started in a small way, and have never attempted great things. We found one man who owned about a thousand acres of land on the shores of the lake, the rest of the shore front being owned by other parties. He was getting along in years and wanted to sell. We agreed to buy his place if he would first get the remaining tracts bordering on the lake. This he did with no great difficulty, and we signed a contract with him for the entire tract, paying $200 on the signing of the agreement and $600 upon delivery of the deed. A mortgage was given for the balance, and this we agreed to pay off in annual instalments of $600. Other farms have been bought on like favorable terms. The mortgages on the 3,000 acres of the preserve now aggregate less than $2,000. We hired an energetic man who had been brought up and married in the place as superintendent and farmer. We paid him $30 per month, which was subsequently increased to $35. He worked for us for three years as faithfully as he could have done for himself, until the lure of town life and its educational advantages for his daughter, as well as the higher wages offered by some one else, won him away from us. For a couple of years we were not so fortunate in finding a man who would work as faithfully in our absence to fill his place, with the result that during this period little was done on the estate in the way of farming or improvement.

After this we found another man who had always lived in a neighboring town and therefore understood farming in that section, whom we were glad to engage. He has done good and faithful work, and we trust that we shall not have to make a change for many years to come. He has one helper the year round, and engages additional men in haying time and as needed. We have not undertaken to raise much produce for sale, but simply to take care of the property and produce sufficient for our own consumption. Considerable standing grass is sold and some hay, as well as surplus potatoes and apples, and occasionally some butter. The privilege of picking blueberries on some of the pastures also brings in a little revenue. The chief income from the place, however, is from the sale of lumber, and so soon as we are properly equipped to handle it should prove very profitable. For the first few years we made arrangements with a family to move into the club house and board members at an agreed upon price, but of late years, with the aid of a housekeeper and cook and the necessary help, we have run

the club house ourselves during the summer season, members being cared for at the farm house when there during the winter. Each spring we ascertain as nearly as possible the number that will be at the club during the summer, and make our arrangements accordingly. In other words, we are organized in such a way that we can at any time extend or curtail our arrangements and expenses to meet such demands as will be made upon us.

It is not our desire to make this a place of fashion. We do not want a big hotel or crowds of people. That would destroy the charm of the place. It is rather our aim to make this a place where we can go and throw off the conventionalities of city life and enjoy rational sports in a rational way—where, in the words of another, we can do as we like, when we like and in the way we like.

There is another successful co-operative club (described by Mr. Emigh in THE INDEPENDENT some years since), in the southerly part of the township, and the friendly relations and co-operation in matters of public improvement existing between the two suggest some of the advantages that would result from clubs with similar aims locating in sections by themselves, in effect, establishing club communities, where large sections and even townships could be taken for preserves, in which natural conditions would prevail for the native game, and pheasants and other desirable species could be introduced with better chance of success, because of the large area in which game of all kinds would be protected and fed thru the winter, if necessary. Wild rice would be planted in the numerous small ponds over a larger area to attract wild ducks, which would breed here in greater numbers were more food thus furnished; larger areas of buckwheat and sunflowers would be planted and left ungarnered for quail and pheasants. Many trout ponds and lakes would be restored as of old by throwing embankments across narrow valleys and streams where opposing hills formerly met and formed a natural lake, the beds of which are now easily discernible. Much can be done in this direction by an individual club, but if a number of preserves were grouped together with a total area of, say, 25,000, 50,000 or even 100,000 acres, which could be obtained here and in many other parts of New England, the resulting benefits to the members of the several clubs would be multiplied many times over, as all would share to a large extent in the success of each.

TOLLAND, MASS.

One of Many

BY CHARLOTTE MELLEN PACKARD

NONE sought for beauty in that rugged face,
Her form revealed no subtle lines of grace,
But in the quiet of her fearless look
One read the life, as in an open book.

Sorrow had walked with her; she shunned despair.
Love drew the poison from gray thorns of care.
Close to her staff of strength the helpless clung,
While little bells of Hope about them rung.

A lovely woman, on Life's common street,
Where myriads go, who never pause to greet,
She has no record in the Hall of Fame,
But lips grow tender as they speak her name.

BRUNSWICK, ME.

Statehood for Oklahoma?

BY GRANT FOREMAN,

[Since this article was written by a very capable onlooker in Oklahoma the President has ordered a census to bring evidence as to the charge of the gerrymander.—EDITOR.]

A CONSTITUTION for the proposed new State of Oklahoma has been framed, but there is a serious question whether it will ever be submitted to a vote of the people; and whether, if submitted, it will be ratified by the people and, if ratified, whether it will be approved by the President. The sense in which the approval of the President is used here refers to the legal requirement that after it is ratified by the people, the President must issue a proclamation announcing that the constitution conforms in every respect to the enabling act before statehood shall be an accomplished fact. The reason that the answers to these questions are obscured by doubt is to be found largely in the actions of the Constitutional Convention and the character of the instrument brought forth by it.

The election held on November 6th, 1906, resulted in the selection of 99 Democrats and 13 Republicans as members of the Constitutional Convention. These figures were pointed to as disposing of all doubt that politically as well as geographically, Oklahoma is to be not only a Southern State but part of the solid South.

In preparing the way for the admission of the State of Oklahoma, Congress was engaged in a task differing from all previous efforts. Oklahoma will be the first Southern State admitted to the Union since the admission of Texas, over sixty years ago. In the admission of the Western States no such diverse interests and sentiments have been found as exist in the new State of Oklahoma. For many years the administration of affairs in Indian Territory, and to a less extent in Oklahoma Territory, has been placed in the hands of Federal appointees.

In the effort to protect the Indians in their treaty rights the Administration has not made friends with a large number of people who have crowded into this beautiful and fertile country, and have developed it into a great civilized community ripe for statehood. Congress essayed an enabling act under which it was believed the various interests could get together. The energy and wealth of the newcomers would find healthful encouragement. The Indians would be protected in their property and suffrage would be secured to the negroes. And an acceptable constitution would be framed. But the result has not justified the hopes of Congress.

The making of the constitution was a great undertaking and a delicate one, but the members of the convention did not rise to the occasion. A more tactless handling of the great responsibility can hardly be imagined. If the members of the convention had exercised the degree of sagacity expected of them, they would have endeavored to limit their critics and the opponents of the constitution to the inevitable disgruntled interests, and not needlessly add numbers and strength to force that is bound in any event to combat statehood and good government.

They would have reflected that Congress and the President were not overjoyed at the prospect of the admission of Democratic Oklahoma; that if they would succeed, they must so conduct themselves as to make friends at Washington rather than to alienate those they had; that they must not lay themselves open to attack by Republican opponents of statehood, and they would have profited by the experience of other States whose admission was opposed by influential forces at Washington.

But such considerations were not for them. They seemed to assume that as the enabling act was passed the bars were down for good and nothing could keep the State out of the Union.

Foolish demagogy was forecasted in the campaign; most of the Democratic candidates pledged themselves that if

elected, they would vote to incorporate in the constitution provision for negro disfranchisement and Jim-Crow cars, tho these things were expressly prohibited by the enabling act as well as by the Constitution of the United States; and incredible as it may seem, in view of certain defeat for the constitution, if such a provision were included, most of the candidates meant to keep their promises and they would have succeeded but for warnings from Democratic leaders in Washington. And when the question was decided on the floor of the convention after days of debate, the vote was a close one.

With consistent stupidity the members exhibited sectional prejudice in the convention by arguing long and earnestly against including in the constitution of the new State a provision recognizing the Constitution of the United States as the supreme law of the land, tho such a provision was expressly required by the enabling act. On the vote, however, the opponents were defeated and the provision was incorporated in the constitution.

Such acts, which are not recorded in the constitution, but are not the less a matter of history, naturally disappointed and estranged many friends of the new State, Democrats as well as Republicans, who are inclined to question whether such sentiments accord with the obligations of a State about to be admitted to the Union.

But as to the merits of the constitution itself, it falls so far short of the standard expected of it as not only to open it to attack by opponents of statehood, but to interpose serious objections to the admission of the State under such organic laws. The convention was not satisfied to confine its efforts to the allotted ninety days of agreeing upon principles and measures belonging strictly to a constitution, but crowded in where, without due preparation, angels might have hesitated and enacted legislation without end. The members apparently could not trust the matter to future State officers and resolved themselves into a legislature to show what they could do along that line. There are many excellent measures in the constitution, especially those intended to curb the lawless power of organized wealth, but they are so obscured by a mass of legislation as to detract from their value.

So charged were the members with legislative ideas that they did not adjourn until they had worked several weeks overtime and had brought forth a document of nearly 50,000 words, about one-sixth of which were employed in making counties of the proposed State, which their critics say was no part of the function of the Constitutional Convention. In a very frenzy of power, its constitutional horizon, limited by party counsels and partisan considerations, this ultra-Populistic-Democratic convention, forgetful of a submission of its work to judicial and constitutional tests, sated itself with legislation, fantastic, untried, impractical, and with great glee put the Republican party out of business in the new State for years to come if the constitution shall be adopted.

The enabling act provided that the convention should form a constitution which shall be republican in form and not repugnant to the Constitution of the United States and the principles of the Declaration of Independence. But there are several features in the constitution which are urged as proof that it does not comply with the enabling act. The initiative and referendum, so framed as to hold legislative enactments in abeyance, is one of them. It provides that the vote of the people on referendum is not directory to the Legislature, but is final as to measures voted on, which it is claimed is inconsistent with a republican form of government.

While obeying the enabling act in the letter by providing that the Legislature shall never enact any law restricting or abridging the right of suffrage on account of race, color or previous condition of servitude, the constitution says that "the Legislature may make additional limitations on the right of suffrage and may add additional disabilities thereto." The negroes say that this leaves the way clear to disfranchise them by the "grandfather clause" or a similar subterfuge employed in other Southern States, and that in spirit the constitution in respect to suffrage is repugnant to the enabling act.

The provision that "no officer, soldier

or marine of the regular army or navy of the United States shall be entitled to vote at any election in this State" has been the subject of sharp criticism, and the G. A. R. of Indian Territory, at the encampment on May 17th, 1907, passed caustic resolutions condemning the constitution and asking the President not to approve it.

It provides also that "any person accused of violating or disobeying any order or injunction or restraint made or rendered by any court or judge of the State shall, before penalty or punishment is imposed, be entitled to a trial by jury as to the guilt or innocence of the accused." The possibility that the accused may appeal to a jury in a court of jurisdiction inferior to that of the court whose injunction is violated, and the probability that this provision will make it impossible for courts to command respect for their proceedings, is pointed to as a serious objection to it.

This startling provision is found:

"No foreign corporation licensed to do business in this State shall, without the consent of the other party to any suit or proceeding brought by or against it in any court of the State, remove the same to any federal court without forfeiting its license to do business in the State."

The constitution has many friends in the new State, including all of those of Populistic tendencies, who hope to see it adopted. And there is another large class of people who admit that it is very defective, but who are disposed to vote for it in order to attain Statehood at the earliest possible date, and trust to being able to amend the constitution as soon as possible after the State is admitted.

But there are strong influences working against the constitution within the proposed State. The railroads and other large corporations in Indian Territory have never paid any taxes except such as were voluntarily paid in incorporated towns and cities in 1907, and naturally are interested in prolonging that pleasant situation as much as possible, and corporations generally will oppose the constitution because of the measures intended to control them. The negroes thruout the new State are against the constitution almost to a man because of threatened disfranchisement, which they claim to see in it. The enabling act requires that the constitution shall provide for prohibition for twenty-one years in that part of the new State now known as Indian Territory and the Osage Indian Reservation. But the convention went farther than this. Beside making the proper provision in the constitution for prohibition within the area mentioned, a separate provision making prohibition extend over the whole of the new State is attached to the constitution to be voted on. The way in which the measure is to be submitted to vote makes it likely that if the constitution is adopted State-wide prohibition will also carry. While this provision meets with the approval of the better element thruout the new State, it has aroused the hostility of the thriving liquor interests of Oklahoma, which will do their utmost to defeat the constitution.

The readjustment of county lines in Oklahoma Territory has made many enemies of communities that feel they will be hurt if the constitution is adopted, and they will vote against it. There is a small army of Federal officeholders thruout the new State whose jobs will terminate with the advent of Statehood, and their votes and influence against the constitution are to be reckoned with. The Democrats have been pleased to disparage them as carpet baggers, and have done what they could to alienate them. A large majority of the Republicans of the new State are aggrieved at the gerrymander in the constitution, which is intended to place the Democrats in power for years to come, for it is provided that the gerrymander cannot be changed except by an amendment to the constitution. Sharing with all classes the common desire for Statehood, some of the Republicans are giving the constitution perfunctory support, but it is probable that they will vote nearly solidly against it.

When Congress passed the enabling act the Senate appointed a special Senate committee to visit Indian Territory, make an investigation and report to the Senate what legislation was needed from Congress to prepare the new State for admission to the Union. This committee was composed of Senators Clark of Wyoming, Clark of Montana, Long of Kansas, Teller of Colorado, and Brandigee of Connecticut, four of them Western men and peculiarly fitted to

recommend wise measures bearing on the situation. In November, 1906, they traversed Indian Territory from one end to the other, had public hearings, took several volumes of testimony, and subsequently recommended to the Senate that a bill be passed removing the restrictions from the alienation of the homesteads of freedmen allottees (the alienation of the rest of their land having been authorized previously), and on all but homesteads of Indian allottees other than fullbloods, so as to make such lands bear their burden of taxation. This the Senate refused to do. As such a large part of the land of Indian Territory is still the property of the Indian and freedmen allottees, and under the law not subject to taxation, the burden of the expenses of Statehood would fall upon the white people, nine-tenths of whom are residents of towns and cities. There are many people who will refuse to vote for the constitution because of this situation. The Indians as a class will either vote against the constitution or will not vote at all, as they do not wish to commit themselves as favoring Statehood of any kind.

The Republican National Committee is also taking notice of the difficulties of the new State, but so far it has not been quoted as expressing any deep-seated regret on account of them. Naturally the Republicans of the country will not grieve over the absence from the next electoral college of the seven Democratic votes from the proposed new State of Oklahoma, and no strain of the imagination is required to see the Republican leaders of the country emphasizing the defects of the constitution, which make it an unfit document to receive the President's seal and approval.

The Democrats, apparently optimistic concerning the question of early statehood, have been carrying on a furious campaign for nomination at their primaries on June 8th, to every office in the proposed State, in which they have spent an amazing amount of money. There have been candidates galore for every office in sight. Unterrified by considerations of propriety, a large number of the Democratic members of the convention are campaigning the length and breadth of the proposed State for the offices created by them, preparing to profit by the outrageous gerrymander which they were instrumental in making. A year ago the Republicans were sanguine of about an even break with the Democrats at election time; now they are apathetic; they have no candidates, there has been no campaign or plan of campaign provided for. In a measure this is due to the big Democratic majority in the Constitutional Convention and the Democratic gerrymander of the State, which, like a killing frost, have withered in its incipience the hope of Republican participation in the government of the new State. But to a greater extent it is due to a general belief among Republicans that there will be no statehood under the present enabling act.

Seven injunction suits have been brought and are now pending to restrain the calling of an election on the constitution. They are based on various grounds attacking the constitutionality of the constitution and raising the question of its non-compliance with the enabling act. The wrong most often urged in the courts against the constitution is that the convention had no business and no power to change the county lines in Oklahoma Territory fixed by Congress years ago. One of these cases has been heard and the trial court awarded the injunction restraining the calling of an election on the constitution as now framed. The case is now pending on appeal in the Supreme Court of Oklahoma. Whatever view that court may take of the question there is still the threat of a further appeal by the defeated party to the Supreme Court of the United States. But if that case should be disposed of there are still others presenting other questions to be decided by the courts, before it will be known when an election can be held. And no one can tell when an election will be held. The leaders of the convention have been urged to reassemble the convention which has not adjourned *sine die,* and eliminate the objectionable features from the constitution in order that an election may be held and to get on the right side of the Federal Administration which is suspected of being hostile to the constitution, but so far they have refused to make any concessions.

Apathy among Republicans has be-

come decidedly marked since the return of Republican delegations who recently went to Washington to see the President about the constitution; they profess to believe that the President will refuse to approve the constitution in its present form, but that he prefers the people of the new State to take the responsibility of defeating it, if it is ever submitted to a vote.

The Democrats have also attempted to sound the President and the Attorney-General on the question of the constitution, offering to make such changes as are suggested to make it acceptable to the President. Naturally Mr. Bonaparte declined to give any opinion on the matter until so requested by the President, and the latter refused to give any forecast of his views in advance of the submission to him of the constitution after the election, in the manner provided by Congress in the enabling act. Leaders of the convention have attempted to square themselves with the President by saying that some of the extreme measures in the constitution were inspired by the speeches of the President.

The several occasions on which the Democratic leaders of the convèntion have attempted to secure approval from Washington of what they had done or were about to do concerning the constitution has not added dignity to their proceedings nor enlisted confidence in their constitution.

No one can say with any confidence when the constitution will be voted on, whether it will be ratified by the people, or whether, if ratified, it will be approved by the President. The utmost that can be said of statehood for Oklahoma is that it is decidedly "up in the air." It is not at all unlikely that the next Congress will extend the laws of Oklahoma Territory over Indian Territory until another enabling act is passed for the new State.

MUSKOGEE, INDIAN TERRITORY.

Three Cent Fares in Cleveland

BY TOM L. JOHNSON

MAYOR OF CLEVELAND, OHIO

FOR upward of forty years the street railway interests in Ohio have been busy at the State capital evolving a complex and cunning system of laws governing the granting of street railway franchises. The result of all this work may be briefly summed up when it is said that the laws as now on the books make it extremely easy for an existing company to secure an extension into new territory or an extension as to the time of its grant or the renewal of an expired grant, while it is extremely difficult for a new and competing company to get anything.

Full advantage of this state of the law has been taken by the street railway interests which are opposing my efforts to bring about 3-cent fare thru competition in Cleveland.

Before an original grant can be made, the law requires that a route be established by an ordinance of the Council and that this route be bid upon, the bidder of the lowest rate of fare to be the successful one, and nothing but the subject of fare can be considered in the bid.

A bid having been made successfully, no franchise can be granted until as a second step the written consents of the owners of a majority of the foot frontage on each street traversed by the proposed route are produced to the City Clerk.

The existing company may extend without bidding, and its expiring grants may be renewed without consents being obtained.

In preventing the competition of 3-cent fare lines, The Cleveland Electric Railway Company, which had a monopoly of

the street railway business in Cleveland, relied principally upon a war of injunctions, having brought in all upward of forty injunction suits against the low-fare lines. At the very outset, however, six years ago, a campaign of commercial and financial persecution aimed to cripple the credit of the low-fare enterprises, so as to make the construction of their roads difficult. To meet this attack on the credit and practicability of 3-cent fare, in several instances I guaranteed the payment of bills contracted by the low-fare railway company to the extent of saying that in my judgment the enterprise was perfectly sound and that I was so sure of it that if the company did not pay its bills I would. I also guaranteed investors against loss by reason of investment, but at no time did I own any of the stock of the road or stand to make any profit out of its success, standing merely to make a loss in case of failure of the project. This is the extent of the so-called "financial interest," which has been the basis of numerous injunction suits brought by the Cleveland Electric Railway Company. In brief, they attacked the credit of the company so that it seemed necessary for some one to assure the public that a 3-cent fare was feasible, and then attacked the franchises given to the 3-cent fare companies because the Mayor of the city had so endorsed them.

The Cleveland Electric, in its litigation, has subdivided its causes of action into the smallest possible fractions, and has started a lawsuit on each infinitesimal technicality. Each one of these suits has then been forced to drag its weary way up thru State courts, and several of them to the Supreme Court of the United States. In this way six years of unending litigation have been fought out, and while seldom unsuccessful in the lower courts in the matter of obtaining preliminary injunctions or temporary restraining orders, the old company has never won an important case in the court of last resort.

Interspersed with the campaign of litigation has been political activity, but since my first election I have been twice re-elected, and each time by increasing majorities. In the last election I carried twenty-five out of the twenty-six wards of the city, altho the city is districted so as to make thirteen Republican and thirteen Democratic wards. Among the Councilmen the question of party politics has seldom cut any figure at all; Republicans and Democrats divide on party lines on other subjects, but are either for or against the low fare.

The net result of the six years' war has been the construction and present operation of some fifteen miles of railway in Cleveland which are being operated at 3-cent fare with a pledge to give universal transfers on any lines to be built in the future. This road has been built at a cost of $50,000 a mile in an era of unprecedented high prices, as against a capitalization of $150,000 a mile upon which the old company bases its estimates when it says that a 3-cent fare will not produce reasonable dividends. On the other hand the stock of the old company has shrunk in value from somewhere about 94 to a present quotation of 48.

In the meantime the Cleveland struggle has attracted attention all over the country, the traction companies elsewhere are lending their influence to defeat the low-fare movement and the people of Cleveland. This is shown in the activity at Columbus at every session of the State Legislature, a powerful lobby opposing any relaxation of the laws which favor monopoly and prevent competition.

In a recent interview the president of The Cleveland Electric Railway Company said: "This is merely a question of who has the longest bank account." With this as its cry the street railway monopoly is proceeding to test its theory that the will of an overwhelming majority of the people of the seventh city of the Union can be absolutely thwarted by reason of the length of the bank account of the public servant which is monopolizing its streets.

Active efforts are now being made among all shades of political factions in Cleveland to line up all the possible opposing forces against my re-election in November, and meantime injunction suit after injunction suit is being filed in an effort to prevent the further extension of the 3-cent fare roads in the city.

The 3-cent fare line has been in actual

operation since the middle of November last and has demonstrated absolutely that the best of service can be given for a 3-cent fare, with payment of 6 per cent. dividends on unwatered securities, *i. e.*, on the actual cost of construction of the road.

CLEVELAND, OHIO.

Oklahoma

BY HARRY H. KEMP

As the New State advanced with the splendor of dawn in her eyes,
A mighty antiphony filled with its volume the skies;
For the Old States were singing a ballad of love as she came,
And the confident voice of the Maiden replied to the same.
In the tones of the Old States I heard a Niagara roar,
Heard the rush and recession of waves on the storm-beaten shore
Of the heaving Atlantic, the creep of the West-kissing seas
And the whirr of machinery fusing its echoes with these:
"From Florida's reefs to the lakes and the mountains of Maine,
From Oregon's coasts to the mesas unloved of the rain—
States tried and approved by the measures and standards of worth,
All born of the passion of men to inherit the earth—
We welcome thee, Sister, and proffer affectionate hands,
Dear Mistress of traffics and farms and delectable lands."
Then heard I the New State replying full joyous and strong,
And her rivers and forests and prairies flashed forth in her song:
"My song is the work I am doing, the riches I bring,
And my hardy-limbed pioneer sons are not fashioned to sing;
For their lives are their poems and ballads; they work out in steel
And timber and soil of the prairie the passions they feel."
Yet, deep as the bass of an organ, there struck in a note
Like the voice of a multiple thousand comprest in one throat
From all occupations and travails which busily ply,
Glad-hearted and wholesome beneath the unlimited sky:
"Ho! Echoing axes afar in dim forests a-swing,
'Gainst wind-swaying trees where the sun-colored orioles sing!
Ho! Hammer and plane of the carpenter building up towns,
On the bosom of desolate prairies and undulant downs!
While princes and rulers devise and amend and discuss
Our farmers and workers are building an empire for us.
The Indian chieftain his peace with the white man has made,
Has laid by his arrow and bow for the plow and the spade.
Near his cabin quaint where the beautiful corn stands a-row
The negro is conquering worlds with the blade of a hoe.
'Tis thus on the rock and the bed of material things,
The soul must prepare for her heavenward thunder of wings;
From the ground soars the lark, tho it fades in the sky as it sings."
Yes! Crudely they sang from the ranch and the forest and mart,
But the best song of all is the song that comes straight from the heart—
Sincerity's ever the surest foundation for art.

LAWRENCE, KANSAS.

Literature

Nelson's Encyclopedia

THE preface to this new encyclopedia* says:

"In the allocation of space to the various topics, *Nelson's Encyclopedia* differs considerably from its predecessors. It is essentially a modern book. While subjects of classical or antiquarian interest are not neglected, a new and special emphasis has been laid on subjects which are of living interest to-day, such as the biographies of living persons, recent developments in science, and the progress of recent inventions."

Whether one regards this paragraph as an inducement or a warning will depend on what he wants an encyclopedia for. Certainly its extreme modernity and decided Americanism produce some remarkable changes in relative values according to customary standards. "Every subject," we are notified, "receives its due allotment of space." And we find allotted to Washington's biography six and a half columns, to Mr. Roosevelt's five and a half, to Lincoln's three and a half and about fifty words over. Without disparagement to the President it may be said that he has not yet intervened between the "Father of his Country" and the "Preserver of the Union." Or does the disparity of space merely record that Lincoln is not "of living interest today"? Such is the pit into which fall scholarly encyclopedists walking by the twin tapers of "living interest" and "Americanism." They tell us further that "the effort has been made to portray each character in an altogether unbiased manner"; and so they have committed Mr. Roosevelt's biography to the altogether unbiased pen of Mr. Roosevelt's Commissioner of Indian Affairs, who owes his office mainly to the campaign panegyric, "Roosevelt the Man." As heroes recede in time, so, almost invariably, do they diminish in space. Cæsar—antetype of Mr. Roosevelt as statesman, soldier and historian of his own exploits—"imperious Cæsar, dead and turned to clay," is exceptionally favored with a column and a half less, and Themistocles, also statesman and soldier, victor at Salamis, "one of the greatest geniuses of Greece," is conceded one column and a quarter. Of Britain's great protagonists, Cromwell — Mr. Roosevelt's Cromwell—is compressed into one and two-thirds columns; while William Wallace, pride of the Scot, is dismissed with a trifle over half a column (less, by the way, than the space assigned to the author of "Ben Hur"). The same penalty is affixed to remoteness from American territory. The distance which divides our littoral from the German frontier reduces Mr. Roosevelt's only extant rival as a "strong man" to two-thirds of a column; but the "living interest" principle exalts William II above William I, founder of the German Empire, who gets only half a column. Could not these "greatest encyclopedia experts in the world" remember how many naturalized Americans of "today" fondly keep watch on the Rhine? The irrepressible Clémenceau, still eclipsed by the Boulanger fiasco when his biography was being written for these pages, is thrust into one-third of a column—but, alas for encyclopedial opportunism! he has since become premier of France and one of the most spectacular notorieties of the time.

"Living interest," it would seem, relegates to oblivion, or obscurity, or subordinate place the historic lives and movements and institutions of Christianity. Track and field athletics can command two-and-a-quarter pages of text (with ephemeral "best records") and two pages picturing the feats of the latest collegiate celebrities; Tractarianism, one of the most fascinating of religious and intellectual episodes, is disposed of in less than half a column. Trusts require an exposition of over seven pages; the immense historic structure of Catholicism is summed up in three and a third pages. Japan, the prodigy of the hour, demands thirteen

*NELSON'S ENCYCLOPEDIA. Everybody's Book of Reference. Edited by Frank Moore Colby, New York, and George Sanderman, Edinburgh. 12 vols. New York: Thomas Nelson & Sons. $48.

and a half pages of text and illustration; Jesus Christ is set forth in ten.

"There is nothing between its covers handed down from an earlier work," we are assured. But how hard it is to break away from the old stereotyped information is shown by the following parallel:

THE INTERNATIONAL.
("Guns, Naval").

"The earliest record of the use of guns on shipboard is derived from an old Japanese painting of the repulse of the Mongol fleet off the shores of Japan in A. D. 1281, the fleet being shown wreathed in smoke from its guns. Kublai Khan, Mongol-Chinese Emperor, certainly had an ordnance department at this time, and it is not unlikely that he mounted some guns on the vessels of his fleet."

NELSON'S.
("Guns, Naval").

"When guns were first used at sea is not absolutely certain, but in a celebrated old Japanese painting of the repulse of the Mongol fleet off the shores of Japan in A. D. 1281, the Chinese vessels are shown wreathed in smoke from their guns. Kublai Khan, the Mongol-Chinese Emperor, had an ordnance department at this time, and it is likely that he mounted guns on his ships."

But in justice to *Nelson's* let us say we have yet discovered no parallel to the International's: "Horace (Odyssey, iii, 4, 22) finds equal charm in *frigidum Prœneste*" (article "Prœneste"). America still awaits a Brockhaus or a Meyer, but until we get one—and it is likely to be long—the needs of many people will be served by *Nelson's*. It is closely packed with very condensed information, under numerous headings. The pictures, tho not handsome, are pertinent, and the type, tho small, is large enough to serve in a work of brief reference. It is satisfactorily accurate, later by several years than any other except its British twin, and much lower in price. The peculiarities to which we have called attention will undoubtedly make it useful to a larger public than if it were framed on conventional lines.

Novels of High Finance

MR. EDWIN ASA DIX tells us in *Prophet's Landing*[1] of a rural captain of finance in the seventies of the last century, a man already much in advance of the methods of the rural usurer and mortgage absorber of its fifties. This general storekeeper knows the tricks of secret rebating on his freight, of depressing real estate by false rumors of the direction of a projected branch railroad, of manipulating its annual reports for the purpose of acquiring the stock far below par, and all the other resources of high finance as they were already practiced in that far-off day in the country's financial capital. The reader sees how he is being led straight to Wall Street, even tho this rural storekeeper, unlike many others, never reached it to apply his undoubted talents to larger ventures. The story has all the qualities that have made its author's earlier novels of New England life deservedly popular—a clear, comprehensive understanding of the New England character, which implies, of course, a sense of humor, an admirably graphic touch of description, which visualizes the village as it does its inhabitants, the peaceful beauty of a New England summer as the severity of its winter, and the co-ordination of details which produces "atmosphere." The story is entitled to a place in the honorable line of our New England fiction.

High finance on a gigantic scale, worthy of this day of trusts in which its scenes are laid, furnishes the plot of Mr. John Corbin's *The Cave Man*.[2] As the title proclaims, the story goes down deep to primitive instincts, to the love of money which is the root of all evil, but also to the strong foundations of character. The external struggle of the independent manufacturer with the heads of the trust that would absorb him goes on side by side, is, in fact, bound up with an inner struggle between love and commercial honesty, and, be it added, that delight in battle which the Cave Man, who slumbers in all of us, knows and welcomes, most of all when his cause is just. There is conspiracy, bribery, theft, misrepresentation in this story, all the outfit of modern questionable business methods, and, on the other hand, quickness of wit, courage and determination. It is dramatic, but it is kept free from melodrama, the touch of sensationalism, of exaggeration to which we have become so accustomed. Mr. Corbin has succeeded in making his heroine worthy of his hero—hence a love-story that has depth and strength, that means more than the usual pretty, unconvincing obligatory romance in most of the current novels of this genre.

[2] THE CAVE MAN. *By John Corbin.* New York: D. Appleton & Co. $1.50

R. M. Lovett's *A Winged Victory*,[3] should leave an impression, but it does not. It is realism, but it is not focused. It has been said that there are no full stops in life, only commas, until the end is reached, but an application of this theory to fiction is apt to result disastrously. Beginning with the childhood of the two daughters of an unsuccessful financier, who is driven from a disastrous real estate speculation to bucket shop keeping, with the result that he is ruled off the Chicago Stock Exchange, the author takes us thru their early vicissitudes, the life of the younger one at a Western co-educational institution, the worldly marriage of the elder and the emotional experiences of the younger, which end in her marriage to a budding playwright; his flirtation with her sister, her meeting of an earlier love and a tragedy. The climax is long in coming, and when it does arrive one fails to see clearly its relation to most of what has gone before. This may be true to life, it may be "imaginary biography," but it certainly is not sound fiction.

A Notable Labor Book

It was Mr. Hutchins Hapgood's aim to find in Chicago a man whose personality reflected the general character of the labor movement, and to record his life in the guise of an autobiography. He did not find just the man he sought for, and he became convinced that the autobiographical form was not the one best suited for the purpose of picturing so complex a movement. But he found one who fulfilled many of his expectations, and he attempts, by the biographical and descriptive mode—by a delineation of the character of his hero, a record of his activities and a description of his environment—to set him forth as a microcosm of the labor world.*

It cannot be conceded that Mr. Hapgood has wholly succeeded in his task. To those who know the labor world best his work is more likely to appear as a vexatious blending of great merits and gross defects. His hero is not a typical representative. The life, the character, the opinions of this man are out of the common. His autocratic methods, his rather violent and quarrelsome temper, his vague, sentimental anarchism, are anything but typical of either the leadership or the following of the American labor movement. The environment, too, is in large part fictitious. The little groups of vapid, cigaret-smoking, free-loving and non-working Anarchists which he sketches may be true enough in themselves, but they are an insignificant part of the world which he essays to picture. One is led to wonder where the large body of Socialists come in, and also where the much larger body of workmen who are neither Anarchists nor Socialists is to be found. Mr. Hapgood evidently failed to see them. He has simply taken the license of a literary man, and finding "atmosphere"—which is usually only another name for the curious and the unusual—in the petty Anarchist groups, he has devotedly pictured them as a setting for his hero. The book is thus hopelessly wrong in perspective and proportion.

But tho the book deserves the severest censure for its false coloring, its fatuous confusion of the anomalous with the typical, and its obliviousness of many of the distinctive characteristics of the movement, there are other respects in which it deserves cordial praise. The personal characterization is often admirable. There is no doubt whatever about the hero, Anton. He proves himself real at every step, whether or not he proves himself the typical leader of labor. His wife, too, is sketched, tho in fainter outline, with a convincing fidelity.

The ideals and the standards of the workers are often happily interpreted, and it is with a rare sympathy that the author touches here and there upon their interests and their aims. Of the workers whom he came to know he writes:

> "I was astonished by their practical knowledge of mankind; I was fascinated by their temperament and robustness and joy in life; I was touched by their altruism and feeling of human solidarity; I felt a kind of class sweetness under their rough manners, and also a class rebelliousness. . . . I saw how a new morality was forming on the basis of a new public opinion different from the past public opinion upon which much of the present law is based."

All this is truly felt and finely ex-

[3] A Winged Victory. *By R. M. Lovett.* New York: Duffield & Co. $1.50.

*The Spirit of Labor. *By Hutchins Hapgood.* New York: Duffield & Company. $1.50.

pressed; and it is unfortunate that so quick and sensitive a responsiveness to some of the temperamental characteristics of this movement should not have been joined with a better understanding of its material framework. But the book, in spite of its faults, is one that should be widely read. There are many who will readily recognize its errors of estimate and proportion; there are many who will be rudely shocked. But there is no one who will not find in it vivid and instructive glimpses of that most interesting phenomenon of the twentieth century—the movement of the progressive proletariat.

Some Women of the Court of France*

By the Salic law debarred from personal political position, women yet wielded at the French Court a more prominent influence than at any other. With Mary, Elizabeth, Anne and Victoria among its rulers, yet England has hardly a name to stand with those many leaders of French society whose fascinations have not vanished with their time. The world is never tired of learning the details of their brilliant days, and besides the critical accounts of famous French women which scholars of their own people have given us, a host of minor histories of these famous ladies come from the presses of England and America. Why is the salon so exclusively a French institution? Is it due to the taste of the French man or the quality of the French woman? The answers to these perennial questions are not to be found in the books before us, altho Mr. Williams's pleasant volume on Mme. Récamier shows us so remarkable and charming a character that we fancy her like would create a salon in London, Berlin, Chicago or, for that matter, in the Sahara.

Mme. Récamier's biography and the sketches of Le Brun and La Marquise de Montagu save these recent publications from the title of "The Scandal Series," and lend them an interest that Marie Mancini, Madame de Genlis and even poor Anne of Austria do not deserve. Mrs. Grant has given a full and interesting account of the colorless Queen Mother of Louis XIV, but she cannot convince a skeptical world of any disinterested sentiment on the part of the wily Mazarin. We feel for Anne as we might for any commonplace and humble lady, to whom the fates have been adverse, but surely no less forceful woman was ever placed in a position of so great power. She had as slight conception of her responsibilities as even that astute little adventuress, Mazarin's niece, Marie Mancini, who aimed to be queen, indeed. Her sinister charm Arvéde Barine makes evident, as she does also that of the less attractive schemer of the next generation, Madame du Maine. The reader cannot but feel a humorous sympathy with the energy, the enthusiasm, for even the grotesque tastes and the absurd pretensions of the tiny Duchess. The other essays of the volume on the mad Queen Christina of Sweden; the piteous Margravine of Bayreuth, and a harlequin Arab princess are aside from the topic of this review. Careless proofreading has turned Nonteuil into some unknown engraver, but the translation of "Barine's" amusing gossip is excellent and in distinct contrast to the slovenly English frequent in two volumes of the group, and to be found now and again in Mr. Williams's more careful pages.

Anything more utterly inconsequent, selfish, useless than the life of the French Court in the reign of Louis XIII, Louis XIV and the earlier years of Louis XV it would be hard to find, and the student waits with impatience the tempest that shall sweep such futilities from the land. It is even hard to see the attraction in those years that show no spark of nobility, no glow of romance in all their glittering magnificence. But with the approach of the Revolution other characteristics show forth. Mrs. Bearne has, in Mme. Tallien, a theatric personality, but one who knew how to choose great scenes. In Mme. de Genlis she has a hypocrite, but one seeking power rather than adulation. The Marquise de Montagu gives a picture of exquisite French family life, of which, because French life had for women so many other

*Queen and Cardinal. *By Mrs. Colquhoun Grant.* New York: E. P. Dutton & Co. $3.50.
Princesses and Court Ladies. *By Arvède Barine.* New York: G. P. Putnam's Sons. $3.
Heroines of French Society. *By Mrs. Bearne.* New York: E. P. Dutton & Co. $3.
Madame Récamier. *By H. Noel Williams.* New York: Chas. Scribner's Sons. $2.

sides, it is easy to lose sight. La Fayette, brother-in-law to the Marquise, is treated with a familiarity and certain family condescension startling to the American reader, but making him a most human personage. Mme. Le Brun gives us a bowing acquaintance with almost every one of note at the time in France, Italy, Austria and Russia. Despite her sorrows, the painter is a joyous as well as a lovable spirit, carrying thruout her exile two sources of happiness, devotion to her art and love for her fellows.

Mme. Récamier, as a character, is even more remarkable than Mme. Le Brun. With no commanding ability such as in itself might draw a group about her, yet, in wealth and in poverty, in court favor and in banishment, in youth and in age, Mme. Récamier was ever the center of a great circle, and ever herself simple, contented, generous, unspoiled by attention from all the famous people of her time. Mr. Williams has sifted the material gathered in the former volumes of life and letters, prepared by Mme. Récamier's niece, and with some new matter has made a most satisfactory story of an extraordinary career. Benjamin Constant here shows himself in a painfully hysterical mood, and Chateaubriand cuts a far less noble figure than Matthieu de Montmorency or Simon Ballanche. Mme. Récamier's lifelong intimacies with these two, and with Camille Jordan, the omission of so many of whose letters is to be regretted, are singularly beautiful examples of the rare friendships that may exist between women and men.

Grove's Dictionary of Music and Musicians. Edited by J. A. Fuller Maitland. In five volumes. Vol. III, M. P. New York: The Macmillan Co. $5.00.

It may be said at once that the third volume of the new edition of this standard English *Dictionary of Music* maintains the high mark of excellence set by its predecessors in Mr. Fuller Maitland's revision of Grove's great work. It will not satisfy everybody, to be sure, and it is not without some minor mistakes—both typographical and editorial—but the revision has been thoro, and the work as a whole, it is now evident, will cover the vast field of musical history and literature more exhaustively, more skilfully and more interestingly than any other "dictionary" ever published. The book before us is more than one-fifth larger than the corresponding volume of the old edition, and a comparison of the two shows that this additional space contains an epitome (within the letters covered by the volume—and of course under large variety of headings) of the musical progress of the last thirty years. Thus there are included for the first time the names of the composers MacDowell, Mahler, Mancinelli, Mascagni, Moussorgsky, Napravnik, Paderewski, Paine, Parker, Pierné and Puccini; and of an equal number of singers and conductors who have come into prominence since the first edition was published. And there are many new articles setting forth the results of recent research and historical investigation. Some of the new topics are "Military Sounds and Signals," "Monochord"—embodying the latest view of the Greek System—"New York Musical Societies" and "Negro Music of the United States." Grove's admirable biography of Mendelssohn is retained intact; the biography of Mozart has been enlarged, and the articles on such important subjects as "Notation," "Opera" and "Oratorio" have been rewritten in more modern spirit. When this new edition has been completed "the monumental and invaluable Grove" will be more than ever monumental and more than ever invaluable to the professional musician, the amateur and the student.

Le Vol de l'Aigle. By Joseph Ribet. Paris: E. Flammarion. 3 fr., 50.

If one wishes to see how our national policy of expansion seems to Europeans he can find no better book to read than this. M. Ribet traces the soaring of the eagle from the time of him whom the French curiously call "Monroë" to the era of Roosevelt and even beyond, foretelling a war between the United States and Japan for the control of the "Pacific Ocean trust." He regards American imperialism as "the most grave and imminent menace that threatens the future of the world," and urges France to take the lead in a European coalition to keep it within safe bounds. It is nevertheless

not written in any unfriendly spirit. He writes in a letter to us:

"I have no animosity against the United States. On the contrary, some of my best friends are from there. But I wished to demonstrate to Europe that it is a delusion to think that the United States is not the richest and strongest nation of the globe, which may become in spite of everything the sovereign nation of the world."

To check American aggression he relies chiefly upon the combined efforts of other nations to maintain a balance of power, and to prevent thru the Hague Court future wars of conquest. It is interesting to note that the ceremonious transfer of the bones of John Paul Jones from Paris to this country does not seem to have produced a favorable impression upon the French mind: *"Ce squelette d'un de leurs grands hommes a été pour les Etats-Unis le prétexte d'un de ces gigantesques 'bluff' mondiaux dont ils prennent de plus en plus l'habitude."*

Lady Mary Wortley-Montague and Her Times. By George Paston. New York: G. P. Putnam's Sons. $4.50.

Among the Wortley-Montague papers Mr. Paston has found some hundred unpublished letters by Lady Mary. Her most delightful letters already belonged to the public, but this find, on which Mr. Paston had drawn largely, makes plainer many points in an always interesting and often puzzling character. The correspondence with Mr. Wortley before their marriage fills much of the first hundred and fifty pages. These amazing love letters, a series of misunderstandings, accusations, explanations, are irritating and even painful reading, yet they are most curious human documents. Either Lady Mary's wit was a later development or it hid itself before an unappreciative audience for not a hair of it is found in these long pages. A sense of humor was not among Mr. Wortley's virtues. That he was a good friend we are assured his relations with the men of his time proves. Certainly it needs proof, for no friendship would bear the strain he confidently put upon Lady Mary's affection. The few letters from the years soon after their marriage are more natural than those preceding, but they show a lovely young wife, striving to please a husband who had no talent for amiability. Lady Mary took the failure of her domestic happiness without rancor, tho with a sorrow that shows even in her latest letters to her daughter. The reader is inclined to lay at this door the vagaries and indiscretions that marked her career after the return from Turkey. Mr. Paston makes good her vindication from any worse follies in the several affairs around which ill-natured gossip once gathered. She was a good friend, but an unreasoning hater. Without, so far as her present biographer makes clear, higher ideals than were in vogue in the years of Anne and the first Georges, she yet lived an honest and self-reliant life, faithful in word and deed to a most chilling husband; a good mother to a graceless son; a loving friend to her only daughter. By some lack Mr. Paston fails to show the charm that Lady Mary's contemporaries for the most part cordially owned, and that the readers of her letters feel, today. It is not that he so judicially exhibits her glaring faults. It is, perhaps, that he so often borrows, and delineates them, the jealous and now discredited words of Horace Walpole. We yet close Mr. Paston's book feeling that the real Lady Mary is shown in the energy, sacrifices and independence called for by her introduction of inoculation into England rather than in the cruelty and scurrillity characteristics of the age, which mark her quarrel with the poor little Wasp of Twickenham.

The Smiths. By Keble Howard. New York: McClure, Phillips & Co. $1.50.

There is a subtle appropriateness in the name of Smith used as the title of Mr. John Kéble Bell's new novel, *The Smith Family*. For it is the chronicle of an ordinary, middle-class English family and at first seems as dull as they are, and as minutely uninteresting as they do. The Smiths are many, and not often enlivened by a Sidney or a Captain John. But, insensibly, we find these particular Smiths becoming more human and their history increasingly absorbing. *The Smith Family* is an English edition of "Monsieur, Madame et Bébé," and all three are lovable people, particularly Master George Henry Nelson Smith, who becomes the most important of the

trio, as a first-born son is apt to do, in France, England or America, if the parents are of the ordinary, unselfish variety, typified by the Smith family, who are very much the sort of people we know, living in Harlem, instead of Surbiton, but otherwise the same. The author has carried out his expressed intention: "To tell the story of two simple lives, and there are no plots in simple lives."

Literary Notes

....*Seventy Years Young*, by Emily M. Bishop (New York: B. W. Huebsch, $1.20), is a good book to give a septuagenarian friend on his birthday, as it is a pleasant expansion of Holmes's aphorism: "It is better to be seventy years young than forty years old." The author's rooted dislike of "habits" is not scientific, but it is expressed with much vivacity.

....People who want to keep track of all the new social movements should get the *Quarterly Newsbook of the Municipal University* (Kansas City, Mo., 50 cents), of which the first copy has just appeared. It is issued in a novel and attractive magazine form and is devoted to the propagation and practical realization of Charles Ferguson's "Religion of Democracy."

....Among the most interesting and useful citizens of New England are men with a genius for local antiquities. New Britain, Conn., is thus fortunate in the possession of Mr. James Shepard, who has compiled with much patience as to detail and accuracy an elaborate *History of Saint Mark's Church, and of Its Predecessor, Christ Church, Wethersfield and Berlin.* The period included is from the first Church of England service in America to the present time. The volume is privately printed at New Britain, Conn.

....*Gaining Health in the West* (Colorado, New Mexico, Arizona), Being Impressions of a Layman, Based on Seven Years' Personal Experience with "Climate," by George B. Price (New York: B. W. Huebsch, $1.00), is a sensible little book of good advice for the consumptive. The writer treats intelligently and succinctly of such topics as Climatic Conditions, Where and How to Live, Marital Obligations, Getting Employment, How to Avoid Loneliness, Social and Ethical Aspects, the Lure of the West, the Nature of the Disease; and adds a "Chapter on Don'ts" and an appendix of statistics.

....As Dante sought the guidance of a poet in his flight to the realms of mystery, so Charles Allen Dinsmore has studied the theme of sin, forgiveness and reconciliation "in the pages of the great seers, who have been recognized by the generations as portraying most truthfully the guilt, the woe, the peace of the heart." The result is a volume of deep religious spirit, ***Atonement in Literature and Life*** (Houghton Mifflin & Co., $1.50), in which, among others, Homer, the Greek Tragedians, Shakespeare, Milton, George Eliot and Hawthorne are made to breathe the breath of life upon the fundamental doctrine of the Christian religion.

....The last Congress past a law which it is hoped will increase by many thousands the number of persons who are addicted to the use of alcohol. This need not alarm prohibitionists, however, for the alcohol which is thus freed from taxation has been so adulterated as to make it undrinkable. It is rather hard to find anything to put in it which would smell bad enough to deter the dipsomaniac and yet not be objectionable to other people, but wood alcohol, benzine and pyridine are relied upon. Tho alcohol so denatured has long been used in Europe; it is a new thing with us, and Mr. R. F. Herrick has done a service in bringing together all the available data on its manufacture and uses. [*Denatured or Industrial Alcohol.* Wiley & Sons. $4.00.]

Pebbles

WIFE—Why, John, how dare you swear before me?

Husband—I beg your pardon, my dear. I didn't know you wanted to swear.—*Chicago News.*

"SIR!" exclaimed the icy co-ed, after the kiss had been stolen, "how dare you! No man has ever kissed me before."

"Oh, that's all right," replied the nervy student. "Somebody had to break the ice."—*Wisconsin Sphinx.*

WHY HE DID NOT DANCE.

THE other day a young man gave a reason for not dancing the spirit of which might be made to apply to a good many failures in life. "I should like to dance," said he, "and I should dance, only the music puts me out and the girl gets in my way."—*The London Tatler.*

Wilfrid Laurier was once on an electioneering tour in Ontario, and, as the elections were bitterly contested, every effort was made to stir up race and religious prejudice. One day a Quebec Liberal sent this telegram to Sir Wilfrid: "Report in circulation that your children have not been baptized. Telegraph denial." To this the Premier replied: "Sorry to say report is correct. I have no children."—*New York Sun.*

Punch has a scene in which a district visitor is shown entering the cottage of a poor woman. The visitor is evidently new to the business and somewhat embarrassed. The cottager says to her: "I'm quite well, thank yer, miss; but I ain't seed you afore. Y're fresh at it, ain't yer, miss?" "I have never visited you before, Mrs. Johnson." The woman dusts a chair. "Well," she says, "yer sits down here, an' yer reads me a short psalm, yer gives me a shillin', and then yer goes!"

The Standard Oil Fine

When Judge Landis sought information, some weeks ago, about the profits of the Standard Oil Company's business, he explained that a court might with propriety inquire, and really ought to inquire, concerning the earnings and financial resources of a corporation upon which was to be imposed a fine the size of which, within certain limits, the same court most determine.

It was then shown by the company's secretary, Mr. Pratt, that for the three years during which the unlawful offences under consideration had been committed the company's net earnings had been $199,800,000, the payment of $117,603,000 in dividends leaving a surplus of more than $82,000,000. The fine of $29,240,000 imposed last Saturday is a little more than one-third of this undistributed surplus and a little less than one-seventh of the three years' net profits.

Believing that these enormous profits were due largely to the proved violations of law, Judge Landis reasoned that a fine authorized by the statute and amounting to less than one-seventh of them (and to less than one-half of the surplus retained in the treasury after 40 per cent. dividends had been paid), was not excessive. A small fine would inflict no punishment upon a corporation whose net earnings average more than $60,000,000 a year. In the Elkins law there is no provision for the imprisonment of a corporation's guilty officers. No one could be sent to jail; the heaviest fine permitted by the statute was nearest to a jail sentence in effectiveness, and therefore it was imposed.

Altho Judge Landis was bound to be guided by the evidence in the case before him, his mind, we presume, could not wholly escape the influence of the history, official and unofficial, of the methods by which this company has gained its commercial supremacy and acquired its power to accumulate $199,800,000 net profit in a period of three years. An example (to be found in the records of a Federal Court), was the railroad compact by which the ruin of the late George Rice was sought. That compact chanced to be brought to light because a receiver's agreements were subject to judicial inspection.

The indictment tried before Judge Landis, and the seven similar indictments now pending, tend to confirm a prevailing belief that the chief sources of the Standard's commercial strength, and the most effective agencies by which it has throttled competition, have been unlawful and iniquitous agreements with railways for preferential rates—such agreements as the one on account of which, in this case, a great fine has been imposed.

Having in mind the history of the company, the American people will agree with Judge Landis in holding that the heaviest fine permitted by the violated statute is not excessive.

Secretary Root and President Castro

Altho the friends of President Castro have constantly stated that the United States would never venture during the present administration to compel him to consent to the arbitration, or to effect a settlement, of American claims, it would seem, judging from recent published reports from Washington, that Secretary Root is not pursuing either a dilatory or a timid policy.

It will be remembered that Mr. Hay, in his so-called ultimatum of March 10th, 1905, intimated that Venezuela must either arbitrate or fight. Mr. Root, soon after he succeeded Mr. Hay, cabled to the American Minister to Venezuela

that the United States hoped to have all differences settled "without recourse to either of the alternatives" contemplated in Mr. Hay's dispatch of March 10th, and made an attractive reference to the desirability of coming to an agreement thru the confidential channels of diplomacy.

Nearly two years have past, and President Castro seems finally to have exhausted Mr. Root's patience. We may, therefore, expect from our very able Secretary's pen a communication to President Castro that will rank in spirit and strength with Mr. Hay's ultimatum.

No American official was ever more desirous than was Mr. Hay to preserve the peace of the world, and only after the most conscientious consideration and from the highest sense of duty would he have addressed these words to a sister American republic

"The attitude of the Venezuelan Government toward the Government of the United States and toward the interests of its citizens who have suffered so grave and frequent wrongs arbitrarily committed by the Government of Venezuela requires that justice should now be fully done, once for all. If the Government of Venezuela finally declines to consent to an impartial arbitration insuring the rendition of complete justice to these injured parties, the Government of the United States may be regretfully compelled to take such measures as it may find necessary to effect complete redress without resort to arbitration."

Mr. Root, from the very fact that he began by reversing Mr. Hay's policy, and gradually has been led back toward it, proves that President Castro's attitude regarding American claims should not be tolerated, and that the time has come to disprove to the satisfaction of every loyal American and to the consternation of every supporter of President Castro that the Government of the United States has not allowed itself to be blackmailed by the audacious ruler of Venezuela or controlled by either the New York or the Philadelphia asphalt clique.

But interest in the Venezuelan situation is not confined to the American continents. Europe also has begun again to discuss it, owing partly to the fact that President Castro has announced that he has decided to repudiate the award to Belgium made by the Mixed Commission that sat in Caracas in 1903. The London *Times* in a lengthy editorial practically calls upon President Roosevelt to take such measures as may be requisite to bring Venezuela to terms, after frankly reminding him of the principles which he announced would govern his policy toward such of our sister American republics as fail intentionally to perform their international duties. At first blush it would seem as if the United States, in attempting to prevail upon President Castro to recognize the Belgian award, could not consistently request at the same time that an American award be revised; but there is no rule of law better settled than that which permits steps to be taken to set aside unjust awards and to have new arbitrators appointed to see that justice is done. Mr. Root has already called President Castro's attention to that rule, but without succeeding in changing his views. Apparently President Castro does not consider the situation serious, and entertains the firm belief that the United States will not for the next two years do more than besiege him with words. In a contest of that kind he rejoices and is formidable. The only argument, however, that he can use with telling effect is that early in 1905 he consented to arbitrate all his differences with the United States and an agreement was made to that effect by him and President Roosevelt and Mr. Hay, but was abrogated by the cablegram that Mr. Loomis sent limiting the general agreement to a special and an offensive protocol covering only the asphalt case.

The Contagion of Unnatural Crime

A WAVE of hideous crime has swept over New York City in the past month that has given a thrill of horror to the country. When the first reports appeared people were apt to dismiss the thought of the horrors with the reflection that it was the work of unbalanced minds, and that while it was sad that it should be so, and supremely lamentable for the sake of the victim, yet that these things need not be taken too seriously or as indicative of depths of depravity in human nature.

Such a reflection is entirely justified from certain standpoints. When in the

course of days after the first report succeeding crimes of similar nature found their way before the public, the thought aroused was likely to be that somehow sufficient care was not being exercised by people with regard to the putting under surveillance of individuals of lowered mentality, whose irresponsibility was more or less recognized, yet whose evil tendencies had been allowed to culminate in the horrible events recorded.

Such reflections palliate for the moment the awfulness of the crimes in as far as they might be concluded to be evidence of human depravity, yet the explanation is not oversatisfying to the ordinary mind, and one wonders what is to come eventually out of conditions that are capable of evolving such criminals in the numbers at present noted.

In the usual figurative language of the newspaper reporter such a carnival of crime is sometimes spoken of as an epidemic. Commonly we are not accustomed to think of the word *epidemic* in this case as employed in any serious sense as indicating the possible contagiousness of such crimes, and the whole question of psychic contagion as a rule is dismissed by people with the thought that the term is highly metaphoric and not to be taken literally. It seems possible that in this a grave error is being committed, and that the absolute epidemicity or contagiousness of crime, especially in its unnatural forms, must be taken as something to be seriously considered in the hope that thus some added mode of prophylaxis against the awful evil may be secured. Any remedial measure, even tho its promise may be but insecure or, at least, not clear to all, can scarcely fail to be eagerly grasped under the present appalling conditions.

It is almost incomprehensible now that for so many hundreds of years intelligent men saw the ravages of real contagious disease without recognizing that it was spread by the contact of individual with individual, and that the disease might be prevented by segregation. Old-time thinkers could not bring themselves to the thought that disease might be so easily prevented. It is scarcely more than a couple of hundred years, however, since even such diseases as smallpox, which are so manifestly contagious, were acknowledged to be anything more than manifestations of particular phases of natural disturbances of the atmosphere. Men would not believe in contagion.

We are prone to laugh, or at least to think very little of our forbears of two or three centuries ago for their failure to recognize this contagiousness and consequent failure to appreciate the possibilities of disease prevention. Is it not possible that we will be laughed at with quite as good reason by the generations of the next century, because we have neglected the influence of psychic contagion?

There is no doubt now that when minds of lower resistive vitality are brought in contact with the details of certain unnatural crimes these seem to constitute an almost irresistible temptation to commit them. It is very probable that in such minds thoughts of these crimes have occurred before, but have been shrunk from with horror. When the news of one having been actually committed reaches them, however, this natural abhorrence that for the moment was the only thing that stood in the way is broken down, and the result is the crime is committed. Unfortunately, between the saving of lives of lowered vitality which has come with improvement in sanitation, and the effect of the over-strenuous life of our large cities, there are many more tottering intellects in our population than used to be the case. Any of these are likely to be affected unfavorably by the reading of the details of sensational crime, and unnatural crime seems to have a special attraction for them.

"Ripper" crimes and strangulations, and the violation of children are especially prone to be contagious. If one of them is committed anywhere in the world and the story of its hideous details flashed abroad, experience shows that it is almost sure to be imitated within a few days or a week. Sometimes the individuals who commit these crimes are not quite conscious of the acts they do. Psychic epilepsy is not a mere figment of the imagination of the legal expert at murder trials, but it is an awful specter that haunts the thoughts even of the conservative alienist. Stevenson's "Jekyll

and Hyde" is not entirely fiction, and is a wonderfully expressive symbol of what actually happens in life at times. The thought of certain forms of crime leads some men by an uncontrollable impulse into a loss of rational equilibrium, and hurries them to the commission of awful deeds, at which they themselves would be most horrified in their normal state, and of which sometimes they are utterly unconscious in their ordinary condition and even unmindful once the moment of impulse has past.

Of course it may be said that our newspapers cannot be published always with the thought of their abnormal readers in mind. Just in the same way it might be said that only those of lowered resistive vitality in the physical order are likely to contract contagious disease and that the rest of us must not be expected to submit to burdensome sanitary regulations for the sake of them. As a matter of fact we submit placidly to our health departments because we know that if those of lower resistive vitality are attacked by disease in numbers, the epidemic gains such strength in its course that after a time the contagion is sufficient to bring down even the strong and the healthy.

The possibility of something of the same kind in the moral order must not be forgotten. At the present time we are permitting every possible incitement to crime to find its way into print. The very fact that most of the criminals escape only adds to the subtle temptation contained in these detailed descriptions. Undoubtedly our sensational newspapers must be held responsible for no small influence in these periodic epidemics of foulest crime that break over our communities. If legal regulation cannot be secured to prevent their criminal suggestions and connivance, at least the honest effort of every decent man must be aroused to prevent as far as possible the evil they are doing. If every man in the community who objects to sensational newspapers were from today to refuse to have anything to do with them, to discourage advertising in them, to use his personal influence against them, we would have the beginning of a movement that, felt in the pockets of proprietors, would do more to reform newspapers than all the legal regulations that could be concocted. Now is the accepted time.

Heavy Reading for the Summer Vacation

THERE is a widespread impression that it is improper to read anything but fiction in the months that have no R in them. Perhaps some mysterious connection is assumed between physical and mental dietetics, so it is thought that one should take to light literature at the same time that he shifts from oysters to cantaloupes. Even on this theory the practice fails of justification. It might be well for one who had been studying hard all the rest of the year to read silly season newspapers and novels, but what about the men and women who have read nothing else? Do not they need a change of diet?

So far as the body is concerned we have got beyond the idea that vacation means torpidity. Most people of sedentary life exercise their limbs and lungs more actively during vacation than at home. The same ought to be done with the mind. Vacation is as good a time for developing your neglected cerebral convolutions as it is for exercising your unused muscles.

Now is the time when you renew your youth, when you pick up your former fads and see if you have forgotten your old stunts. You try swimming, riding, tennis, baseball, once again. "It has been—let me see—twenty years since I had on roller skates, but I used to be considered," etc. You try and the boys and girls glide past you. See if you have softening of the brain as well as softening of the muscles. "I used to take a great interest in astronomy when I was in college, but I haven't looked at a book since 18—." Well, it is time you did. The world moves, so do all the rest of the heavenly bodies, and a great deal more is known about them than in 18—. Find out what it is this vacation.

It is possible that some of your old ideas, the garments of your former thought, have become moth-eaten and musty stowed away in some corner of your brain. Get them out for an airing and see if they are still sound and near

enough in the fashion so they will not look ridiculous to those who have more time to keep up with such things than you have had.

If you don't know how to catch up in your favorite science ask your friend, the professor of —ology, to recommend the latest readable book on the subject. He will look at you with amused contempt for your lay curiosity, but he may tell you, if he knows of any. Glance over the book reviews in back numbers of THE INDEPENDENT, especially the annual summary of the important books of the year, and pick out one that seems worth reading.

If you are fond of history you have a rich field to choose from; half a dozen extensive histories of England, America and the world now coming out at the rate of a volume or two a year, and any number of memoirs, biographies and letter books. Try a volume of the "Political History of England" or Paul's "History of Modern England" or Rhodes's "History of the United States" or Hart's "American Nation" on some period in which you are interested. Get one of the large composite volumes of the "Cambridge Modern History," planned by Lord Acton, on the "Restoration," "Reformation," "French Revolution," "United States," "Thirty Years' War" or "Napoleon." Lord Acton's single-volume collection of "Lectures on Modern History" is varied and stimulating. If you want to see your boyhood's hero, Julius Cæsar, appear as a modern politician, compromising between the opposing forces of labor and capital, read Ferrero's "The Greatness and Decline of Rome." Dill's "Roman Society from Nero to Marcus Aurelius" has sold like a novel, for it caught the attention of many who do not often read history.

Have you kept up with the recent advances in our knowledge of heredity? We used the word "knowledge" because biologists have stopped guessing and theorizing and have gone to work in the laboratory with their coats off to find out. Read Morgan's "Experimental Zoölogy" to find out what they have found out. Loeb's "Dynamics of Living Matter" will also be apt to give your ideas a wholesome electrical stimulation.

How much do you know about radium? Enough to understand the significance of the discoveries reported every little while in the newspapers? If not, read Duncan's "New Knowledge," or, if you don't mind working out or dodging a mathematical formula, Rutherford's "Radio-Activity." Did you know that there is a new way of constructing a universe besides the old-fashioned nebular hypothesis? You can find out all about it in Chamberlin and Salisbury's "Geology."

Ingersoll's "Life of Animals" will tell you what you ought to know about the mammals. Hall's "Adolescence" will be found provocative of thought and argument in a multitude of new lines. Among religious books Herrmann's "Communion of the Christian with God" and Schmidt's "Prophet of Nazareth" are both instructive and constructive.

Then there is pragmatism. If you don't know anything about it now you will have to some time, and you cannot have a better introduction to it than Professor James's new volume of lectures. His "Pragmatism," like many of the other books here mentioned, cannot be classed as "heavy" reading, except as that term is used to cover everything outside of vaudeville literature. The pragmatic movement is taking many forms; it is discussed in a literary way in Santayana's "Life of Reason," from a scientific standpoint in Poincaré's "Science and Hypothesis," and as a metaphysical problem in Schiller's "Studies in Humanism," all well written and stimulating books.

There is really no reason to be afraid of getting a hot box in your brain from thinking in the summer time. You have, or should have, more undisturbed and independent hours in the vacation season than when your engagement book is written full a month ahead. Some of these volumes will disturb the equilibrium of a hammock and would hurt if dropped from a drowsy hand, but you are less likely to fall asleep with them than with a trashy magazine or the patent inside of a country paper.

Power, Cleanliness and Beauty

Two terrible indictments were framed by John Ruskin against the vast industrialism which was developed, chiefly in England and in the United States, and less extensively in France, in Germany

and elsewhere, in the nineteenth century. One was that it had destroyed justice between man and man. The other was that with monstrous brutality and swiftness it was ravaging man's heritage—the earth, and destroying beauty. In the first of these indictments, Ruskin was joined by all the Socialists. But there was a sense in which his philosophy was deeper than socialism. No one can read his pages without discovering that in Ruskin's thought the destruction of beauty is the greater and the more devastating wickedness, because he did not believe that any man could cease to enjoy beauty and continue to be good, or that men could be made good in an environment of physical vileness and ugliness.

Without taking quite so despairing a view of industrial evolution as Mr. Ruskin did, thousands of men and women have felt in some measure the depression to which he gave voice. No one could journey thru the Black District of England, or the mining and industrial centers of Belgium, or visit in the United States the great manufacturing sections of the Middle West, made filthy and hideous by their pall of soft coal smoke, without asking whether there was to be any limit to the sacrifice of cleanliness and beauty to the creation of the coarser forms of material wealth. Railroad travel has been made possible at fairly good rates of speed to nearly every part of a continent which, two hundred years ago, was mainly an unbroken wilderness. But it has never until now been made comfortable for the ordinary passenger, compelled, as he has been, to endure tortures of carbonic acid gas and dust, and to ruin at least one suit of clothes in journeying half a day. Hard upon this blackening of atmosphere and earth with dirt and noxious fumes, followed the destruction of the forests and the blasting of the most beautiful hills and cliffs. It seemed, indeed, as tho man had lost all care for those higher enjoyments to which, by any rational philosophy of life, the acquisition of material goods should be subordinate, as means to end.

Of late, however, there have been signs of reaction. New York and New Jersey gave a worthy example to the whole civilized world in their legislation to preserve the Palisades. Switzerland is taking vigorous measures to preserve her superb scenery from irreparable ruin, and even practical Germany may yet do something to save those parts of the Valley of the Rhine which are not already given over beyond recovery to a ruthless industrialism.

Nevertheless, no one who understood the tremendous power of the economic forces that move the modern world, could indulge himself in any well-grounded hope that cleanliness and beauty might once more become vital interests to mankind unless some revolution in industrial methods should incidentally make them a by-product of the great creative processes. The rapid progress of scientific knowledge and of invention afforded some reason to expect that the substitution of electricity for steam might yield such results.

Things move with almost breathless swiftness in the industrial world these days, and apparently we have already arrived at the passing of the coal-burning engine, not only on the railways but in the manufacturing establishments. Simultaneously with the application of electricity to transportation came the invention of the gasoline engine, and its application to the motor-car. Only a few persons among the millions have any imagination to speak of, and only a few, therefore, saw in this new development the prophecy of a complete transformation of power-producing methods. Yet the beginning of the transformation has come.

Within a few days past the steam locomotive has disappeared forever as the regular means of drawing trains thru the long tunnel by which railroads from the North enter New York City. The passenger may now ride in entire comfort, with car doors and windows open, from the Grand Central Station to all nearby suburban points, and it is a safe prediction that within a few years there will be no coal-burning locomotives engaged in the passenger service between New York and Boston or New York and Albany.

But this is only the beginning of the new order. Far more revolutionary will be the substitution on long-distance railway transportation, where electricity is as yet impracticable, and in manufacturing establishments, great and small, of

the gas engine for steam power. Under the directions of the United States Geological Survey, extensive experiments have been conducted to determine the relative economy of steam and gas engines. The results, now for the first time made public, are well-nigh astonishing. The new power means a saving, we are assured, of from $100,000,000 to $200,000,000 every year in the country's coal bill, and, what is perhaps quite as important, it makes the poorest qualities of coal, and even the deposits of lignite and peat as available for power as the best bituminous and anthracite.

It is difficult to estimate the addition to the national wealth which this invention will bring, but that is only a small part of the boon which it will confer. The internal combustion engines belch neither smoke nor dirt into the atmosphere which we must breathe. Once more the great beautiful country that lies between the Allegheny Mountains and the Rocky ranges will become clean and sweet. The people themselves can be clean. Their houses and streets can be clean, and it will be worth while to make them beautiful. With cleanliness and beauty in our environment, the spirit of mankind itself will change. We shall begin to care for the things—even here in America—that make life beautiful.

Modern Miracle Plays

It is generally supposed that miracle and morality plays exist nowadays only survivals in such isolated communities as Oberammergau and as revivals on such occasions as the Oxford Pageant and the Ben Greet performances. Really they have sprung up as a form of popular entertainment in the United States, quite spontaneously, ignored by antiquarians and without benefit of clergy. No summer resort, street fair, or recreation annex of an exposition is regarded as complete without one, and some of the amusement parks have two or three, running continuously afternoon and evening, seven days in the week.

The medieval miracle play originated under religious auspices, primarily for the purpose of giving biblical instruction to an illiterate people, but its value for drawing crowds and their money to a particular place was not long unappreciated, and in time became a dominant factor in its development. The miracle play of the present is pursuing the reverse course. As a mere matter of business it was found that spectacular shows reached a larger public if they became ostensibly moral, and, later, that if a religious flavor was added they would become still more profitable. The people who pay five dollars a seat will applaud the most pestilential vice and immoral ideas if set to beautiful music and gorgeously displayed, but to catch the fifteen-cent crowd the theology and ethics must be strictly orthodox.

The effective display of modern stage effects and electric lighting demanded grander themes than ordinary life afforded, so the Bible was drawn upon for appropriate material. At the Louisiana Purchase Exposition "Creation" was introduced on the Pike and drew immense crowds at the unusually high price of fifty cents apiece. This was a revolving panorama presenting tableaus of the seven days of creation, beginning when the earth was without form and void and ending with the honeymoon of Adam and Eve. Appropriate passages from the first chapters of Genesis were recited during the spectacle. The success of this led to the establishment of other biblical spectacles and finally of plays in which the vices and virtues were personified. In fact, the development followed in a way the three stages of the medieval drama, first the mystery, then the miracle, and lastly the morality play, but in swifter succession, as befits a recapitulation in our more rapid times, passing in three years thru what before required three centuries.

The diluvial spectacle had long been popular, and it was an easy matter to change the Johnstown or Galveston flood into Noah's. This opens with a scene of luxury and debauchery that fully justifies the impending catastrophe, and when the warnings of the venerable patriarch are received with jeers and he is driven away with indignities, the audience is quite prepared to listen with satisfaction to the shrieks of the drowning sinners as the rising and the falling waters unite to destroy them. After the clouds have cleared away the ark is seen

floating alone on the face of the waters, the dove it sent out of the window, the ark lands on the top of Ararat and the animals come out two by two. "Belshazzar's Feast" affords another opportunity to introduce a similar spectacle of immorality and its consequences. The ancient strife between the courts of Assyria and Egypt still continues, for "Pharaoh's Daughter" stands beside "Belshazzar" as a rival for popular favor.

The biblical vein is only beginning to be worked by our entertainment inventors, and since it has proved so profitable we may expect the utilization of much more of its spectacular material. The ten plagues could be staged with great effect, or at least some of them. Lang and Haggard in "The World's Desire" have shown what can be done with this episode in a romance. The story of Samson with an athlete as the hero and hinged scenery in the last act would be quite to the popular taste. We venture to predict that the American public will not have to wait long to see Daniel in a den of real lions.

The spectacles variously entitled "The Last Judgment," "Heaven and Hell," etc., are in the nature of morality plays. On another page of this issue Maxim Gorky gives a remarkable pen picture of one of them. But it must be remembered that most of the audience have more naivété or greater imagination than Gorky, and so they either fail to see or willingly overlook the tinsel and sham which are all he sees.

In "Heaven and Hell" there is a transformation scene beginning with a cemetery and ending with the flight of departing spirits with the aid of a stereopticon and after the manner of Doré. The spectators then descend to the lower regions with a disembodied spirit as guide and there behold sinners receiving punishment appropriate to their misdeeds. As the crowd file thru the dark and tortuous passages the skeletons seated in lurid caldrons or in flames wag their bony jaws and tell the stories of their sins and repentance in voices of a phonographic twang. Following the precedent of Dante, unpopular political and financial personages are introduced, much to the delight of the medieval-minded spectators.

What the moral effect of these plays is it is hard to say. Who can tell by watching a congregation file out of church how much they have been impressed by the sermon? The crowds who attend them are serious enough, even reverent, in their demeanor, altho the scenes are sometimes presented in a way that makes it difficult to maintain this attitude. Of course the devil is something of a comic character, but then he always was. Preachers have never been able to get people to take him seriously, even in the days when he was most implicitly and literally believed in. "Laugh at the devil and he will flee from you" has long been a popular version. The accounts of the old miracle plays show that rules and punishments were not able to prevent the devil from playing to the galleries and becoming the clown if not the hero of the drama. The chief question that can be raised about these modern miracle plays is the old one of whether the seductiveness of the scenes of Oriental vice is counterbalanced by the moral lesson of consequent ruin. The dancers of these royal courts have obviously received their training in the "Streets of Cairo," but this "Masque of Virtue" pays better. A twentieth-century audience is not so much afraid of a universal flood, an invasion of Medes and Persians, fire and brimstone, or even the devil himself as to be checked in their pursuit of pleasure by these forms of chastisement.

It was the growth of these two elements of levity and license that led the Church finally to disown and anathematize the drama it had nurtured. It will be interesting to see what attitude it will assume toward this spontaneous popular movement toward a religious drama. So far there has been manifest no tendency to meet it or recognize it unless we regard as such the introduction into Sunday school entertainments and the like of scriptural dialogs unacted, of biblical tableaux without words and of life-size colored moving pictures of scenes in the life of Christ. There are many plays in our theaters now based on biblical themes, such as "Ben Hur," The Eternal

Light," "The Shepherd King," "The Sign of the Cross." Sudermann's "John," Heyse's "Mary of Magdala" and Aldrich's "Judith." Some of them are of a high literary merit, and they draw their audiences from both inside and outside the churches.

Leviticus and Numbers

It is probable that no small proportion of our ten million American Sunday school students who are pursuing a year's course of lessons in the Old Testament are off on vacation during these weeks when extracts from the books of Leviticus and Numbers form the topics for study. It must be said that less will be missed, both by way of understanding the Bible and of helpful religious lessons from neglect of these books than from failure to attend to almost any other portions of Scripture which are likely to furnish the theme of Sunday school study. The third and fourth books of the Bible by no means approach the first and second, either in interest or importance, and comparatively few of the subsequent writings do not yield a larger measure of profit both to the devotional reader and to the historical student. Nevertheless for anything like a thoro knowledge of the Old Testament and of Hebrew religion this portion of the Pentateuch is indispensable, and careful attention to the teachings of these chapters will highten by striking contrast the spiritual and moral elevation of other parts of the Bible.

The book of Leviticus is *par excellence* a book for priests and for those who think of religion under priestly conceptions. It is entirely the product of the priestly school of writers, and embodies the laws of the second temple and the ideas which obtained in the narrow and poverty-stricken days of Israel's faith. It dates from about 500 B. C., a century farther from the time to which it imputes the laws it records than we are distant from the time of Columbus. It is certainly dependent upon Ezekiel, who died about 575 B. C., and is the product of Jewish piety in the days of the Babylonian exile. Samuel knew nothing of its prescriptions when he sacrificed at Ramah, nor Elijah when he repaired the altar on Mount Carmel. Jeremiah removes all ground from beneath its historicity when he declares: "For I spake not unto your fathers, nor commanded them in the day that I brought them out of the land of Egypt, concerning burnt-offerings or sacrifices"—matters with which Leviticus is largely occupied, and for which it claims the authority of Moses. Not until the time of Ezra (458 B. C.) were its laws enforced, and their enactment was not a sign of progress. For it is the lower elements of religion with which Leviticus is concerned, laws of diet, prescriptions about clean and unclean, regulations for a just and duly constituted priesthood; and with these are mingled a somewhat superficial and mechanical notion of sin and forgiveness. The deep piety of the Psalms and the moral fervor of the prophets are on a distinctly higher level than that of this priestly law-book, and the relation of one to the other is not that of feeble beginning and subsequent strength, but of retrograde from a worthier life and thought.

This is not "extreme criticism" in regard to Leviticus; it is the view taken, for example, in Hastings's "Dictionary of the Bible," both in the excellent article on the book by Harford-Battersby, in the article "Hexateuch," and in the lengthy essay by Kautzsch on the "Religion of Israel" in the Extra Volume. If one desires to see what can be made of Leviticus on the older theory, he could not have better guidance than that contained in the exposition of the late Rev. S. H. Kellogg, in the Expositor's Bible, where spiritual truth is derived from each ritualistic regulation.

The book of Numbers is our sole authority for the nomadic period in the history of Israel, and therefore it must be somewhat disconcerting to learn that it is largely from the same late priestly document, and to read in the scholarly commentary on the book by Prof. G. Buchanan Gray that much of it "can be demonstrated to be unhistorical; much more of it is of such nature that it can, with far greater probability, be explained as unhistorical than as historical." In the light of such opinion it would not be

wise to insist too strenuously that the journey of Israel thru the wilderness in strictly ordered ecclesiastical procession, as related in Numbers, is strictly according to fact. Why should not young people be told frankly that this was the view of the matter of a later age, and that we have no story from the time when the event happened? Why should we teach them what they must later sadly unlearn, or put upon them a burden of faith which we ourselves were never quite able to bear?

In reality the modern critical view of these books is a great relief to troubled minds. When once it is admitted frankly that the story of the death of Nadab and Abihu by direct punishment from God, because they used "strange fire" in sacrifice, is a late midrash, having no foundation in fact, simply the imagination of a zealous priest who supposed that was the way things ought to have occurred, and concluded therefore that they did occur so; when this understanding of the matter is admitted one is excused from seeking many burdensome explanations. It is so much better not to be obliged to defend God for murdering people because they made a mistake in ritual. The newer understanding of the Bible is altogether in the interest of sounder morals and worthier religious belief.

One may draw excellent lessons of prudence and courage from the story of Caleb and Joshua as prospectors of Canaan, but on the whole the use of Leviticus and Numbers in a manner tending to edification is more than a trifle difficult. Their real place in the study of Old Testament religion is after the Prophets and the Psalmists, to bring out the possibility and danger of decay and lapse from the noblest moral enthusiasm and the truest spiritual piety, into a faith that measures altars and is anxious about the colors of a priest's robe. These books are in the Bible to teach us that when religion undertakes to be anything more than holy reverence for God and severe effort to keep His commandments, it deteriorates inevitably into something very much less; and perhaps a summer's study of tedious books is not too great a price to pay for so valuable a truth.

The New Philippine Assembly

It can scarcely be expected that the new Philippine Assembly, elected by a registered vote of less than 62,000, will fairly represent the people of the islands, but those who fear that its sessions will be made futile and ridiculous by wild agitators may be happily disappointed. It is not surprising that many of those elected were formerly insurgent leaders. They have not lost the influence and ability which gave them prominence in the days of the insurrection. Some of them have since been appointed to important offices by the Government which they then attacked. If it be true, as reported, that conservative and well-to-do Filipinos deplore the election of such men as Dominador Gomez and the probable control of the Assembly by the radical element which he represents, they should place a great part of the blame upon themselves, for it is asserted that a majority of them did not register.

The Alton Syndicate

It has been overlooked by nearly all those who have commented in the daily press upon the speculative "development of the Alton railroad's financial resources" that the operations in question were not those of Mr. E. H. Harriman alone, but those of a syndicate of which he was a member. Justice requires that the existence of this syndicate should not be ignored. After referring to the condition of the Chicago & Alton Company prior to December 31st, 1898, and to the value of the company's property (about $40,000,000) on that date, the Interstate Commerce Commission said in its recent report:

> "About this time, Edward H. Harriman, Mortimer L. Schiff (representing Jacob H. Schiff), George J. Gould and James Stillman formed a syndicate to buy the stock and bought it for $200 a share for the preferred and $175 a share for the common, making the total cost of the shares purchased $39,042,200."

It was this syndicate that was responsible for what the Commission calls the "indefensible financing" of the following seven years, which increased the capital indebtedness by $80,000,000 while spending only $18,000,000 for improvements and additions. Altho Mr. Harriman ap-

pears to have represented his associates as an officer of the company, it was the syndicate that was responsible for the issue of bonds, the handling of them, the dividend of 30 per cent., the "rich rewards" in large commissions paid to the banking house with which one of the four members was connected, and all the remarkable and highly profitable operations which make the record of this Alton affair a memorable chapter in the history of American railway finance. But the parts played by Mr. Schiff, Mr. Stillman and Mr. Gould have generally been ignored in current criticism, and the burden of the whole thing has been placed on the shoulders of Mr. Harriman, who in those days was an agent rather than a principal. He has enough to answer for, but he was not the whole Alton syndicate, and in that group he was associated with men whose power and responsibility were at least as great as his own.

The Revival of Demonism

Last week we published a curious article showing that the devil worship among the Koreans exerted a noticeable influence on the views of the American missionaries stationed among them. It is apparent, however, that modern demonism is not confined to Korea, China, India and Africa. Demoniac possession with all the old characteristics is reported as forming an important part of the fanatical religious revival being conducted by two Swedish women in Cassel, Germany. In Italy anti-clericals have taken to the Black Mass and other forms of devil worship. And, what is perhaps more ominous still, the *Contemporary Review* devotes eighteen pages to an article by George Barlow arguing that the pessimistic tone of recent literature and the wave of crime sweeping over the world is due to the evil influences of disembodied spirits who died with their passions unslaked and therefore still linger earthbound, working out their unhallowed desires thru living puppets.

"Think of the enormous pressure which this mass of living 'dead' must exercise, is at this moment exercising, upon us! Think how easy it is to account, on this ground alone, for many of the crimes and errors of the human race! For we have the whole past of the human race encumbering us and pressing upon us; pressing upon us, not with any mere inert weight of historic precedent, but with the active force of numberless distinct, conscious, passionate personalities, all dying of hunger and thirst, so to speak, and all strenuously endeavoring to appease that hunger, to assuage that thirst, by taking possession of and using the still warm-blooded, still available, frames and nervous systems of the living!"

At this rate how long will it be before we have trials for witchcraft again in our courts? *Facilis decensus Averni.*

The Rusting of Iron

Iron, on which modern civilization depends, is a very perishable metal. It has two great enemies, air and water, and, unfortunately, these are the hardest things in the world to hide away from. It is able to resist either one of them alone, and to keep a bright face and a stiff backbone, but if they form an alliance and attack it together a blush overspreads its face and it collapses into a heap of dirty brown powder. Exactly how these two enemies of iron work together for its destruction has long been a matter of dispute. Some have claimed that the dual alliance required the assistance of a third party, carbonic acid gas or hydrogen peroxid, but the recent investigations carried on in the Office of Public Roads of the Department of Agriculture by Allerton S. Cushman, Assistant Director of the office, seem to prove that the action is purely electrical. By means of an ingenious indicator the presence of the two opposite poles in every piece of rusting iron was shown, the positive pole where the ferrous iron ions developed being colored blue and the negative pole where the hydroxyl ions accumulated becoming pink. At the former points the iron is dissolving due to the exchange of irons ions for the hydrogen or acid ions of the water. These electrical couples may be numerous and close together. The pitting effect which may be observed on any rusty iron fence is caused by a crater formation where the center is of one electrical sign and the ring around it of another. The practical lesson of it is that if we want to prevent our bridges, ships and high buildings from decay the steel must be as pure and even in texture as possible, for the presence of a speck of another metal or a different kind of iron starts the electrolysis. Of course an alkali will stop the rusting, because

it prevents the accumulation of the hydrogen ions that do the mischief, so it is good policy to put slaked lime about an iron post set in the ground.

End of the Coolie System

Whatever may be said of the failure of the Campbell-Bannerman Government to carry its measures thru both Houses of Parliament, and as to the futility of its pronouncement in the Commons against the Lords, one achievement must be allowed to it: it has ended the Chinese labor situation in South Africa. Seventeen thousand coolies will go before the end of this year, and the remainder will soon follow. If the Government later should desire to reconsider their determination, it would be beyond their power, for the Chinese Government and the Chinese themselves would have to be reckoned with. In the last election there was very deep feeling on this subject of Chinese labor, which was little else than a system of temporary slavery. It was claimed in its favor that native labor could not be had; and it could not, at the price and under the conditions which the mine syndicates were then willing to allow. But now we are informed that it will be quite possible to get all the native labor wanted, even from the neighboring Portuguese colony. Let it be remembered that it is General Botha's own Government of the Transvaal which has decided, under pressure from the Home Government, to send back all the Chinese at the end of their contract period, and go back to native labor. He says that the change will lead to more employment of whites and to more healthy and stable conditions. It is fortunate for this country that the proposal to dig the Canal with coolies fell thru.

Direct Questions and Answers

We find in the Richmond, Va., *News Leader* some correspondence which concerns THE INDEPENDENT. Mr. John R. Eoff, of Christiansburg, Va., sent us the following letter:

"Dear Sir—I have been a reader of THE INDEPENDENT for some years, and have noticed the frequent allusions to Southern politics, especially as to the policy of Southern States toward the negroes. Will you kindly state, point blank, whether or not you favor a mixture of the people of this country, a miscegenation of the races by intermarriage and the annulment of the Jim Crow laws? Do you think Northerners understand the negro question as well as do the Southerners, and ought not the latter be allowed to govern their own States without interference from the North?"

To this the editor of THE INDEPENDENT replied as follows:

"Dear Sir—I have the enclosed letter from you which I answer as plainly as I can. We do not favor miscegenation. We condemn the miscegenation which has produced millions of mixed blood. With intermarriage we have no business. That is a private, personal matter; but we do hold that if a man has a child by a colored woman he ought to marry her. We do favor the annulment of the Jim Crow laws. I believe the average Southerner is very ignorant of the condition and character of the better class of negroes. They know mainly the lowest. I have visited them in their homes, as you would not dare or care to do, and I know their aspirations and ability better than you do. Certainly the Southerners ought to govern in their own States, all Southerners, white and black, being allowed and encouraged to vote equally."

The Richmond editor who prints these letters does not like the reply. He says it shows "profound, pitiable and abject ignorance," with "all the arrogance associated with ignorance, and the narrowness of view and thought which is an essential part of bigotry," with "shallow assumed profundity." "Profundity" indeed! It was meant for the simplest lucidity.

The only summer resort guaranteed by the United States Government to be free from mosquitoes and excessive heat is the Panama Canal zone.

We still occasionally receive complaints that THE INDEPENDENT in its magazine form is no longer of use in lining the pantry shelves.

It would be very pleasant living in a city if there were not so many people there. The country would be delightful if it were not so lonely.

Why is it that the first thing a pastor does after he gets a new church is to change the hymn books?

The Japanese have frightened the Emperor of Korea so he dare not say his Söul is his own.

Insurance

Suggested by a Neglected Cemetery

SCATTERED here and there in many parts of New England are private cemeteries. These private cemeteries contain stones and monuments all marked with one name. Loving care is, generally speaking, lavished upon these places. An ornamental fence often surrounds such a cemetery. The memorial stones are usually neat and occasionally very elaborate. They bear biographical records of and tributes to persons who have played their parts in the world's comedies and tragedies. In these cemeteries, however, as in the public ones, neglect too often creeps in. The luxuriant grass grows unrestrainedly. The weeds crowd out the flowers planted by grief-stricken hands. The stones sag. Sometimes they fall. The sandstone slabs, carved with quaint cherubs and rimed verses, disintegrate. Moss grows over the names, the dates, the years. The vacationist cannot always escape the shade of sadness that comes over him as he observes the progress of decay thus exemplified. The neglected public or private cemetery is an object lesson that must teach us all how soon we are forgotten. Rambling in such a cemetery we are forced to realize the academic certainty of the flight of time, the decay of hope and the certainty of death.

The New England cemetery teaches its chance visitor that the inexorable years will pass and that the time is bound to arrive when those who now live will join the great majority and fall asleep in death. Then a few illegible lines on a weathered stone will sum up all the ambitions, hopes, loves, sorrows and tears that once were ours. Perhaps the visit to a neglected cemetery will do good as a vacation incident. Certainly it will do this if by it the visitor comes into a more certain realization of the fact that character is a priceless legacy and that "no man lives to himself and no man dies to himself." With a man's advent in this world comes responsibility that grows with his advancing life and continues after the vital spark goes out. It is an essential part of a man's responsibility to provide for his children an educational equipment so that they may be able to care for themselves; to help them to find a place in the world when the proper time comes and to secure for them at least a partial independence. In our day and generation this ideal can, by taking thought, easily be accomplished. The beneficence of life insurance has accomplished much along such lines in the past and will accomplish more in the future for those who prudently avail themselves of its aid. Just now, when we are in the mountains, by the sounding sea, or in the quiet country, and see by chance one of the neglected cities of the dead, it ought to be an inspiration toward life insurance. With a life policy, even if the cemetery in which we are finally laid be neglected, we will have done our part toward securing the welfare of our loved ones, which of itself ought to be a certain satisfaction.

ACCORDING to figures just published the great Krupp Steel Works at Berlin yielded a profit of $3,500,000 for the year just closed. The Krupps employ 64,354 laboring people, whose average wage is $1.50 per day. Some conception of the company's enormous operations is to be obtained when it is understood that 2,500,000 tons of coal were consumed during the year. In addition to the great profits, $1,700,000 was paid out to employees in sick and disability benefits, old age pensions and insurance benefits. The concern also maintained thirty-one hospitals, almshouses, workmen's clubs and other beneficial institutions for employees.

The Insurance Press has discovered a new fire hazard in Minneapolis, where the local fire department was recently called to a building set on fire thru spontaneous combustion that originated in a barrel of sauerkraut.

Financial

Financial Conditions in Japan

Owing to recent discussion as to a possible disturbance of our relations with Japan, the financial condition of that country and the financial operations of its people should excite some interest here. A few weeks ago, Japan sought to float in London a new loan of $20,000,000 in 5 per cent. bonds, issued at 97, of the South Manchurian railway, guaranteed unconditionally by the Government. The money was to be used in broadening the gauge of the road from Port Arthur northward. Altho the loan proposition was skilfully handled by strong houses, only about one-half of the bonds were sold to the public, the underwriters being compelled to take 48 per cent. of the issue. Japan has borrowed enormous sums abroad in the last few years. While the foreign investor's appetite for her securities may not have been satiated, the worldwide strain upon loanable capital, with the resulting increase of interest, prevents an eager demand for her railway bonds if their yield is only a shade better than 5 per cent.

It may be also that the recent course of financial and commercial affairs in Japan has suggested caution to investors abroad. Following the war, between July, 1905, and January of the present year, 3,336 new companies were organized there with a capital of $302,000,000, and 580 old companies added $123,000,000 to their capital. This movement continued in the present year, until it was checked by a sharp reaction. In the first five months 1,169 new companies, capitalized at $112,000,000, were organized, and 249 old ones increased their capital by $63,000,000. At the same time all classes were led to engage in speculation on margin and otherwise. When the inevitable collapse occurred, a short time ago, distrust prevailed, and there was a run upon the banks, several of which appear to have been in so weak a condition that they could not meet demands for a few thousand dollars. A dozen of them suspended payment, and nearly 200 of the new companies went into liquidation. The price of securities became sharply depressed. We find it reported that the Tokyo street railway shares were recently quoted at 76, altho the dividends have been 7½ per cent. Such conditions at home tend to affect the making of new loans abroad. Sometimes they also account for local popular irritation, opposition to the Government, and unwise political utterances or action.

Steel Quarterly Report

Reports of the Steel Corporation are regarded as a kind of trade barometer. Net earnings for the quarter ending with June broke all records. They amounted to $45,503,705, exceeding those of the quarter immediately preceding by $6,381,213 and those of the best previous quarter (December, 1906) by $3,758,741. And the quarter's appropriations for improvements, $18,500,000, were larger than ever before. On the other hand, unfilled orders showed a decline from 8,043,858 to 7,603,878 tons, altho the total was larger than at the corresponding date in any previous year, exceeding by 800,000 tons the quantity reported on June 30th, 1906. It is announced that there has been a further and a considerable decline since July 1st. This is mainly in railroad material. A moderate recession appears to be indicated, and there is room for it. Chairman Gary a few weeks ago predicted such a recession, expressing the opinion that it would be beneficial.

....Seventeen locomotives, the largest ever built in this country, were recently shipped from Philadelphia to the Orleans Railroad of France. The value of the locomotives, cars and rails exported from the United States in the fiscal year just ended was nearly $28,000,000.

....During July the national debt was reduced by about $24,000,000, owing to the redemption of 4 per cent. bonds maturing on the 1st. At the close of business on July 31st the debt amounted to $1,273,275,342.

Survey of the World

The Oil Trust Suits

In Chicago, on the 9th, the Standard Oil Company's attorneys procured from Judge Grosscup a writ of error, having decided to appeal from Judge Landis's decision to the Circuit Court of Appeals. Action upon a writ of supersedeas was deferred, pending a determination of the amount of the bond. The Government contended that the bond should be for $29,240,000. John D. Archbold, vice-president of the company, criticised the Government for issuing Commissioner Smith's report immediately after Judge Landis had imposed the great fine. It was shown at Washington, however, that the report had been ready some time before Judge Landis's decision, and had been withheld in order that the Government might not seem, by publishing it at an earlier date, to be preparing the public mind for a heavy penalty. An officer of the National Petroleum Association having asserted that the company was about to increase the selling price of oil, Secretary Charles M. Pratt denied that such action was to be taken. In a public address at Riverside, Cal., Secretary Garfield said Judge Landis's decision would prove to the people that "no man, big or little, is above the law." The Standard Oil Company, he added, and some other corporations, "had gone ahead on the theory that they were so powerful that they could do things which the ordinary citizen could not do." The Government was showing them that this was not so. Mr. Bryan commented as follows:

"Some had expressed the hope that Judge Landis would not impose the maximum fine because they feared the Oil Trust would merely increase the prices to the consumers and make them pay the enormous fines, even as they have been required to pay the generous contributions made by Mr. Rockefeller to educational funds. But Judge Landis had nothing to do with that theory, and it is well he imposed the maximum figure. It is more than likely the Oil Trust will shift the burden to the consumers, but this will only aid in the crystallization of that public sentiment that will be expressed so forcefully that men in authority will cease to trifle with the violations of anti-trust laws and will vigorously enforce criminal statutes which provide for the imprisonment of the arrogant monopolist even as the common rogue is imprisoned. Good for Landis, and now let us have, just as a beginning, a few prosecutions under the criminal clause of the Sherman Anti-Trust law."

Chancellor Day, of Syracuse University, deplored "the use of the court and the prosecuting machinery of the country to direct the frenzy created by a long and persistent yellow appeal of demagogism, given respectability and increasing force by the present Administration." The Standard Oil case, he continued, was "plain enough":

"It was begun by the President's attack before Congress to bring pressure upon the Senators who hesitated to pass the Hepburn bill. It has been dragged before judges appointed by the President and tried in parts of the country hostile to the company. The corporation has been assailed by a commissioner in a report untrue to fact as the trial was about to begin, in utter violation of common fairness."

Sentence was pronounced, he added, in a spiteful and vindictive harang, and it was followed by another "assault of the Commissioner, again untrue in fact and puerile in reasoning." He thought it remained for the American people to say how far they could "safely permit the courts to be used in the game of politics."——Acting Attorney-General Russell, referring to rumors about new suits

against railroad and other corporations, said, on the 8th, that the Department was quite unable to do one-tenth as much work as it was supposed to be doing. "When," he added, "it shall have continued a while longer enforcing the laws against rebating and restraints and monopolies of trade, the result cannot fail to be a sounder and less tainted prosperity."——At Jamestown, N. Y., on the 9th, a Federal grand jury reported ten indictments, for rebating, against the Standard Oil Company, the Vacuum Oil Company (controlled by the Standard) and the New York Central and Pennsylvania railroads. The counts of these indictments permit the imposition of fines amounting to $18,240,000. It is alleged that the railroads granted to the Standard a special and unlawful rate of 11½ cents, when the regular rate was 26½.—— A long statement from Attorney-General Bonaparte has been published. In the beginning he speaks of complaints that criminal prosecutions against trust magnates and sentences of imprisonment have been very infrequent. It is true, he says, that a better moral effect would be produced by sending a few prominent men to jail than by a great deal of litigation against the corporations controlled by them, but it is only successful prosecutions that would have a good effect:

"Some time since, two corporations and their respective presidents were indicted jointly for violation of the criminal provisions of the Anti-Trust law. If the corporations were guilty of such, it would be hard for the lay mind at least to understand how their presidents could be innocent. Nevertheless, the jury convicted the corporations and acquitted the presidents. It is the avowed purpose of the Department of Justice to prosecute criminally any one who is really responsible for violations of the Anti-Trust law wherever it can do so with any reasonable probability of success. It does not care to prosecute mere underlings who are known to every one to have acted under the direct authority of their superiors. But if it can get a case against any of the superiors such as justifies a reasonable hope on the part of experienced lawyers that he can be punished personally, the department will undoubtedly take advantage of the opportunity as soon as it is presented. Inasmuch, however, as its only duty is to enforce the law, the department does not propose to institute any proceedings in which it does not hope to bring the guilty ones to justice."

Answering questions as to the collection of the fine imposed by Judge Landis, he remarked that any corporation convicted and unable to pay might be placed in the hands of a receiver until the money required should be procured from the business or assets.

A Report Upon Prices

Another report upon the Standard Oil Company's methods was published by Commissioner Herbert Knox Smith on the 11th. It relates mainly to prices, and asserts that the company sells its oil in foreign countries at prices much lower than those it receives at home:

"Having a monopoly at home, it has charged such prices as it could thereby extort, and the American consumer has had to pay these prices. Meeting competition abroad, it has given the foreign consumer enormously lower prices, and it has used the profits made at home to maintain its position abroad, so that the American consumer has been severely discriminated against for the purpose of maintaining, not the dominance of American export trade, but the dominance of a particular combination which has used its power frequently and conspicuously to the disadvantage of the American public."

Discrimination in the company's prices in this country, "proportionate to the extent of its monopoly in a given place," is shown by the report. "The evidence is absolutely conclusive," says the Commissioner, "that it is the policy of the company to take full advantage of all non-competitive conditions to impose the highest prices possible." The discriminations in domestic prices, he asserts, were "largely made possible by the widespread system of discrimination in railroad rates, mainly secret, which was long enjoyed by the company," and which was the subject of an investigation by the Bureau of Corporations a year and a half ago.

Telegraph Operators on Strike

Seventy Western Union telegraph operators at Los Angeles went on strike last Wednesday night (the 7th), owing to the discharge of one of their associates and the company's refusal to take him back. It is asserted by the company that Ryan, the dismissed man, had been maliciously and persistently delaying important messages. His associates say this is not true, and that false charges against him were

made by a non-union employee (who had entered the service as a strike-breaker), because he was an active union man. Owing to this controversy in Los Angeles, union telegraphers in many cities were quitting work a few hours later, and on Saturday night about 4,000, in thirty-one cities, were on strike. The beginning was in Chicago. Union operators there refused to receive messages sent by the non-union men employed in the strikers' places at Los Angeles. On Friday morning there were 1,600 strikers in Chicago, and operators in other cities were following their example. Denver, Charleston, St. Louis, Atlanta, New Orleans and Fort Worth were among the cities thus affected. In some places employees of the Postal Company went out with those of the Western Union. On Monday at 1 p. m. about half of the operators in the main office of the Western Union in New York stopped work, and an hour and a half later many of the Postal Company followed their example. Labor Commissioner Charles P. Neill and others attempted to settle the controversy. It was announced at a meeting of the union operators that Mr. Neill had started for Chicago, at the request of President Roosevelt, and would confer there with Samuel J. Small, president of the telegraphers' union; Samuel Gompers, president of the Federation of Labor, and Ralph M. Easely, chairman of the National Civic Federation's executive committee. An impression prevailed that it would be very difficult to reach a settlement. In Chicago and several other cities the strikers, after stopping work, had demanded a considerable increase of wages. The Western Union was sending non-union men to Chicago from the East. To operators who should remain in its service the Postal Company promised that their regular salaries should be a bonus in addition to wages on the basis of a seven-hour day. President Small said on the 11th that the strikers would resume work if the Government would investigate their grievances and insist upon arbitration. A former president of the local union in New York also said that what the men desired most of all was an agreement providing for arbitration. He asserted that men who presented grievances were punished by dismissal, and that the Western Union had not been true to the agreement procured two months ago by the intervention of Commissioner Neill.——The long controversy between the union lithographers in New York and their employers has been closed by the submission of the men. One year ago the employers insisted upon an open shop and required their men to withdraw from the union. When the latter refused they were locked out.

Prosecutions in San Francisco

Louis Glass, vice-president of the Pacific States Telephone Company, at the end of whose first trial for bribing the San Francisco supervisors the jury disagreed, will soon be tried again. Prosecutor Heney says that at the second trial it will be proved beyond question that Glass ordered the payment of the bribe money. At the first trial he sought to obtain the evidence from Emil J. Zimmer, another vice-president of the same company. Zimmer refused to testify or to be sworn. He is now in jail for contempt, and may be kept there a long time. Detective Burns asserts that the evidence against Glass has now been obtained from another source. Theodore V. Halsey, the agent who was indicted for making the payments to supervisors, has been attacked by appendicitis and is in a precarious condition at the hospital. A jury in his case was impanelled last week. The twelve prominent members or officers of labor unions who recently accepted appointments to the Board of Supervisors from ex-Mayor Schmitz, who is in jail, have been severely criticised by the press.

The Filipinos' New Assembly

It has been decided that the session of the new Assembly shall begin on October 16. Secretary Taft will probably arrive at Manila two days earlier. The number of registered voters was underestimated by the Government in the dispatches forwarded before the election. About 100,000 votes were cast, and 89,137 of them have been officially reported. The following dispatch from

Governor Smith was published at Washington on the 10th:

"With all municipalities heard from except eighty, following is the vote cast for various parties: Nacionalistas, 44,223; Progresistas, 25,523; Independistas, 17,472; Catholic, 1,356; Aglipayan, 91; Aguinaldo, 1; scattering, 471; total, 89,137. From this it will be seen that the Progresistas cast a little less than one-third of the vote, but secured only one-fifth of the Assembly. The Progresistas, Independistas and Catholic votes exceed the vote cast by the Nacionalistas by a small margin. The eighty municipalities to be heard from will not raise the vote beyond 100,000. With a Christian population of nearly 7,000,000, the voting strength is shown to be only about 1½ per cent."

As both the Nationalists and the Independents ask that independence be granted without delay, it will be seen that nearly 70 per cent. of the votes were cast in support of that demand.——Congressman Nicholas Longworth, the President's son-in-law, speaking at a dinner of the Commercial Club in Honolulu on the 7th, said he "hoped the Philippines would not long be with us."——Twenty-one of the 100 young Filipino students sent to this country four years ago to be educated in American colleges started for home last week with diplomas in their pockets. Twenty-three of their associates had preceded them, and 46, it is said, have decided to remain here for a time. Major Vattmann, an army chaplain, who has the students in charge, remarked that every one of them had won a prize at college. "They studied too hard," he added, "and it was difficult to prevent them from overdoing. Their uppermost thoughts were of the day when they would have a hand in conducting affairs of the Government."——In an address at Honolulu on the 9th, Secretary Oscar S. Straus said that Pearl Harbor would be so improved that it would accommodate the entire navy of the United States. In his opinion, communication between Hawaii and the States was restricted and made difficult by our coastwise navigation laws.

Cuba

In Pinar del Rio, the negroes are completing an organization affiliated with none of the political parties, their purpose being to obtain for their race a greater share in the Government and more offices than have heretofore been assigned to it. Batrell Oviedo, a negro, has prepared and distributed a statement showing that there are only two negro officers of the rural guard, only two negro policemen in Havana, and no negro officer of the artillery. He asks that the work done by his race in the war for independence be remembered and that the number of offices granted to it be in proportion to the negro population. The statement has been sent to President Roosevelt.——Yellow fever has broken out in the American garrison at Cienfuegos, where ten privates of the hospital corps have the disease.——A band of twelve armed negroes, led by Arturo Mendoza, formerly an officer of the Cuban army, has been raiding farms in Santa Clara Province. Governor Magoon ordered the rural guard to capture the outlaws, dead or alive. One of them was killed and the band's ammunition was taken. Mendoza's aim, it is said, was to start an insurrection.

The Hague Conference

The Hague Conference is now in its ninth week and is beginning to near its end. From a news point of view there is little of great importance to report since our last week's issue. On Wednesday the the French proposition to abolish prize money secured only sixteen votes. (Mr. Choate reminded the committee that prize money has been abolished in America.) Seven votes were given to the proposition that ships wrongfully seized during a war should be compensated for. The Italian proposition that dirigible balloons must be in the hands of military experts received twenty-one votes and was referred to the editing committee, altho England opposed the whole idea of an aerial warfare. The publication in one of the London papers that Germany was secretly opposing the United States proposition for a permanent court has brought out the fact that Germany is working shoulder to shoulder with the United States for this proposition. Baron von Bieberstein, the German first delegate, even gave out an interview in which he said that he would accept the American proposition in every respect except as to the question of obligatory arbitration, and Mr. Choate had cheerfully accepted his attitude. While believing in obligatory arbitration as an

ideal, he felt that only after the permanent court had proved itself a success and had become fully appreciated would it be proper to make reference to it obligatory. The court will in no sense supervene the Permanent Court of Arbitration established by the Peace Conference of 1899. It will be called the International Court of Justice, to differentiate it from the older court, and will be composed of judges, while the Permanent Court of Arbitration is composed of diplomats. The advantages of the new court will be that it will be able to convene within a fortnight after a case is brought before it, and that its judges will be paid by all the nations, so that a small nation will have no hesitancy in referring a dispute to it on account of the cost. The Anglo-German proposition for the establishment of a Prize Court is receiving some opposition, but it is expected that it will eventually pass. In regard to the question of the automatic and periodic meetings of the future conference, M. Nelidoff, of Russia, has declared that he will oppose the British proposition that the representative Powers meet at The Hague two years previous to the conference in order to arrange a program. M. Nelidoff is of the opinion that such a preliminary meeting would start a pacifist agitation thruout the world, which would be embarrassing to the governments. The American delegation is receiving unstinted praise on every side for the work they are doing, and some critics have even gone so far as to say that they have saved the Conference this time, as they did the Conference of 1899.

The Belfast Strike

It was supposed that when the troops were established in Belfast that the strike was practically at an end and that the traffic could be resumed. But the week has been one of increased violence and disorder which the police have been entirely unable to control without calling in the troops. Workmen were prevented by the mobs from entering the reopened factories, and drays were attacked by the striking dockmen wherever they appeared. On August 9th, 10th and 11th the troops were in constant requisition, charging thru the streets with fixed bayonets or drawn swords to clear them of the mobs. The police and troops were attacked with stones and broken bottles from the upper windows of the houses and many of them were seriously injured. In some cases the mob made a stand upon the streets and fought with clubs and missiles against the charging cavalry. Women and children were sometimes placed in front to protect the men.——The bill for the relief and restoration of evicted Irish tenants, which past the House of Commons recently, received radical amendments in the House of Lords, but was finally past. In its new form it is not at all acceptable to the Government, and doubtless the House of Commons will refuse to concur in the changes, thus scoring another grievance against the Upper House. The bill providing for the right of appeal in cases of convictions for crime similar to that existing in civil cases was past unanimously by the House of Lords.

Troubles in the Balkans

The summer has, as usual, brought again the never-ending conflicts in the Balkans between the minor nationalities, which seem determined to secure control of the disputed territory by exterminating their rivals. In the vilayet of Kossovo Servian bands raid the Bulgarian villages, while on the northeast Bulgarian bands are carrying on a two-handed fight against the Servians on the one side and on the other against the Greek marauders from the south, and the Turkish troops keep up a desultory warfare against all three. The Greeks have been particularly active of late in creating disturbances for the purpose of extending northward Greek influence and eventually the Greek frontier. The Porte has issued a diplomatic note to the Greek Government calling attention to the fact that these bands receive financial and moral support from Greece, and that the good relation between the two States is imperilled by their raids. There are said to be more than a hundred Greek bands of patriotic brigands in the mountains near Kastoria, from which they

make raids on the valleys for the purpose of driving out the Bulgarian population, pillaging, burning and ravaging the villages, carrying off the women and torturing the children. Many of the villages have been depopulated, either from slaughter or immigration to America. According to the Mürzsteg program an international police under the control of a joint Russian and Austro-Hungarian Commission is empowered to keep order in this turbulent district, but they do not seem to have accomplished any decided reform. The Civil Agents apparently do little more than transmit reports to the Inspector-General, Hilmi Pasha. One of the English officers engaged in this work, Colonel Elliott, was attacked by a Bulgarian band at Guredjik and wounded in the thigh, but was rescued by the Turkish troops. It was the intention of the Bulgarians to hold him for a ransom. At Seres, a town fifty miles northeast of Salonika, an intrenched band of Greek insurgents was surrounded and almost annihilated by the Turkish troops. The Bashi-Bazouks took advantage of the occasion to pillage and burn the Greek houses of the town. Three other Greek bands in Macedonia have been similarly wiped out. The kidnappers of Robert Abbott from his father's home in Salonika last March have been captured and have confessed. A ransom of $75,000 was paid them, but the British Government has demanded that this sum be repaid by the Turkish Government.——In Asiatic Turkey the condition of the Armenians has not perceptibly improved. Ferid Pasha, who, as Vali of Bitlis, was considered responsible for the massacre, has been removed, but has been made the Vali, or Governor, of Trebizond. He was driven out of Bitlis and wounded by a Mohammedan mob on account of his oppression and cruelty. It is reported that most of the money sent him for relief of the Armenian sufferers was spent on his own residence.

Turkish Raid Into Persia

The northwestern boundary of Persia, on the Turkish frontier, is again the scene of border warfare. A body of 6,000 Turkish troops, with artillery, crossed into Persian territory about forty miles beyond what the Persians consider the proper boundary, ravaging and burning a number of villages. Among them was the Christian village of Mavaneh, where thirty men were killed and sixty women and children killed or carried off. The Turks afterward drove the Persian garrison from an adjacent camp and occupied it. The raid was headed in the direction of Urumia, a town of about 40,000 inhabitants, situated near the western shore of the lake of that name. Here there is an American Presbyterian college and a seminary for girls, and much apprehension was felt in this country for the safety of the missionaries. Ambassador Leishman pointed out the danger to the Turkish Government and was assured by the Porte that orders had been sent to stop the forward movement of the troops. In response to an appeal from Persia, the Russian Ambassador at Constantinople joined with the British Ambassador in urging the Sultan to have the boundary question settled by peaceful measures. A joint force of Russian and British engineers marked the boundary some forty years ago, but the matter has been the subject of constant dispute and frequent fighting ever since. The affair has given occasion for a violent attack upon the Government in the new Persian Parliament. Prince Firman Firma, Minister of Justice, was appointed Governor of the Province of Azervijan, where the trouble has occurred. Parliament offered the Prince $75,000 as a defense fund, but he declined to accept it, and declared to Parliament that he would start immediately for the frontier with 10,000 men equipped and maintained at his own expense. This is a striking proof of the revival of Persian patriotism, which has so long been extinct. All classes, even those who have been profiting by corruption and privilege, are united in a desire for reforms which will secure for Persia a position as an independent nation and free her from the intrigues and rivalry of Russia, Great Britain and Germany. The parliamentary committee appointed to consider the plans proposed for the establishment of a German bank in Teheran has declared that several clauses are quite inadmissable. It objects principally to

the clauses which provide for the forcible collection by the authorities of all debts due to the bank two months after the specified time of payment; the granting of plots of land upon which the bank is to erect its buildings; the concession of all mines and narrow-gauge railroads to the bank, and the granting to the bank of preferential rights in the matter of concessions for a mortgage bank, irrigation schemes, water works and other undertakings. The Persian papers are outspoken against the abuses of the government. As it has been reported that in several cities of Persia girls have been sold by destitute parents in order to secure money to pay taxes, a comic paper published a cartoon in which girls were hung over the shoulders of the Governor of Khurasan just as fowls are brought to the market for sale.

The Bombardment of Casablanca

In consequence of the murder of eight foreigners in Casablanca and the danger that all the other foreigners in the city would soon meet a similar fate, the French cruiser "Galilée" was ordered to that port. The foreign residents had taken refuge in the French, Spanish and British consulates, which were almost surrounded by Arabs and in constant danger. Pasha Mulai Amin had, it is said, admitted his inability to maintain order and authorized the landing of French troops. Accordingly at five o'clock on Sunday morning, August 4th, a detachment of fifty French marines, in command of an ensign, was landed. They passed thru the watergate, which was closed behind them, and they then found themselves in a narrow street confronted by Moorish troops, who at once opened fire at them at close range. Five of the marines and the ensign were wounded. In spite of the fact that the ensign was shot thru both hands he ordered his men to fix bayonets and charge, which they did, killing 150 Moors while forcing their way thru the streets to the consulate. As soon as the shots were heard the "Galilée" opened fire on the city, shelling the native part and de-

molishing the Moorish batteries on the fortifications. An infuriated mob, composed of the inhabitants, assisted by the tribesmen from outside and the Moorish soldiers, began pillaging the city. The Jews were massacred by hundreds, the children beaten to death and cut to pieces, and the women ravished. All that was valuable from the stores and private houses was carried off by Arabs; the Custom House was looted and a large part of the city burned. The French cruiser "Du Chayla" was summoned by wireless, and on entering the harbor drew up broadside to the beach and opened a destructive fire with melinite shells on the mob in the market place. The bombardment continued all day, and some 2,500 shells were discharged by the French cruisers. The total slaughter of Jews and Moors is reported at 800. The Spanish cruiser "Don Alvaro Bazan" landed a party of troops for the protection of the Spanish Consulate, but did not take part in the bombardment. When the French ships "Gloire," "Jeanne d'Arc," "Condé" and "Jules Ferry" arrived, 4,000 troops were landed and encamped outside of the town to protect it from the tribesmen, who made repeated attacks. The Pasha, when called to account by the French for the attack on the landing party, replied that it was done thru a blunder of the customs troops. The French Consul demanded that the offending soldiers should be sent in chains to the consulate, and this was done. Similar outbreaks of fanaticism are apprehended at Rabat, Mazagan and other ports, and even Tangier is not regarded as safe.

Foreign Notes

In accordance with the recent imperial edict, all the opium dens in Canton and Hongkong were closed on August 9th, with great rejoicing on the part of the people. The streets were decorated with banners and paraded by bands of music. China has reluctantly given her consent to the American proposal that a joint commission of England, France, Germany, Holland, Japan and the United States investigate the whole question of the opium trade and production.——Thanh Thai, King of Annam, has been deprived of authority by the French Government and interned in his palace at Hué. A regency of the Council of Ministers, under the presidency of the Minister of Justice, has been established. The French Resident, who is, of course, the real ruler of the kingdom, has had several times to interfere to save the lives of the King's attendants and ministers. A year ago the King had seven of his wives tortured to death in his presence ——Marcellin Albert, who was recently the idol of the Midi, has now fallen from his pedestal. Since his release from jail by the French Government he has been received with jeers and hisses by the people who a few weeks ago thronged by the hundred thousand to see him and put themselves under his command. At Argelières, his home town, he had to barricade himself in a house to escape the mob, who believed that he had betrayed the cause of the vinegrowers to his own profit.——The organ of the liberal Catholics of France, *Demain,* has suspended publication on account of the papal syllabus against heresy. The journal says:

"Amid the present confusion the sincerest Catholic ideals are so obscured and misunderstood that it is necessary to await the restoration of calm before resuming work.

"To the extent to which the decree of the Holy Office is applied it will annihilate in the Catholic schools exegetic and moral criticism. We say 'to the extent to which it is applied,' because, even at Rome the necessity of abandoning certain of its prohibitions will be evident if a dangerous impasse is not soon to be reached. To fetter the free exercise of criticism is to destroy the reason. It only remains to be remarked that the elaboration and publication of the decree coincide with the introduction in our public schools of the study of the critical history of religion and especially of the origin of Christianity."

——Prince Scipione Borghese, winner in the Pekin-Paris race arrived in Paris on August 10th, having made the longest automobile run on record. He covered the 6,900 miles in exactly two months on an Italia car without accident or repairs except the replacing of a wheel. He was escorted into Paris by a squadron of cavalry and hundreds of automobiles. The route was thru the Gobi desert, Siberia, Moscow, Posen and Berlin.

True Animal Stories

[The present controversy on nature fakirs, with Burroughs and Roosevelt for the prosecution and Long, London, Roberts *et al.* as defendants, has brought up the old question: "Do animals reason or act only from instinct?" The discussion promises to be long and hot, for opinions range from the extreme of Descartes, who held that animals are merely automata, without consciousness or volition, to that of endowing them with human psychology and even superhuman powers of divination. Whenever the question is broached in any circle there are as many people ready to bring forward remarkable instances in their own experience as when ghosts are mentioned. Knowing that our readers must have many good animal stories which they have not been able to tell as often as they liked, we have opened the columns of THE INDEPENDENT to them. All the letters we publish were signed and contain only the personal observations of the writers; none of the evidence is second hand. Doubtless affidavits can be produced, if necessary. As for their interpretation, that is another matter. We have cut out all philosophizing and attempted explanation, and present the bare facts to the jury of our readers without argument. We have asked Mr. Hornaday, author of "Two Years in the Jungle," "The American Natural History" and "Camp Fires in the Canadian Rockies," to add a comment on these stories.—EDITOR.]

The Samaritan Badger.

Not long ago I shot and wounded a badger, so that it could not walk. As I walked toward it, it began to utter a plaintive growl; then another badger got out of a hole close by, and, taking the wounded one by the upper part of the neck, it succeeded in dragging it to the entrance of their home before I got there.

JOSEPH LECLERC.

LYONS, KAN.

Foxy.

Some forty years ago, while fox hunting in this (Columbia) county, I saw a gray fox climb a tree to a hight of about twenty feet. The tree was a small black oak, the lowest limbs of which were within five or six feet of the ground. The animal was hard pressed by the dogs, and it was a case of "any port in a storm." My companion on that occasion, an old fox hunter, expressed great surprise at the incident, declaring it to be unique in his experience. It certainly was in mine.

A. C. KELLOGG (M. D.).

PORTAGE, WIS.

A Practical Joker.

A certain Tabby, with whom I was well acquainted, and whose useful life ended a few years ago, showed one day a most decided sense of humor. She came running in from the garden in great excitement, carrying something in her mouth, purring and calling to the other cats to come and share her treasure. She waited until they had all assembled, six or eight of them. Then she proudly laid down before their eager eyes—a little, old, dried-up pear! I can see her victims now walking off in disgust at the deception, while Tabby straightened herself up, watching them and giving her tail a few switches, which was her way of laughing.

MARY LESLIE IRWIN.

NEW YORK CITY.

His Lost Foot.

My father, who was a constant reader of THE INDEPENDENT for many years, while living at Ashland, N. J., had a dog named "Watch." He was of mixed breed, with his *bull* blood probably the most prominent.

One day while out in the hay field where they were cutting grass with a two-horse mowing machine, "Watch," unnoticed by the driver, ran in front of the knife, and before the machine could be stopped his foot was cut off. We bandaged it the best we could, and it soon healed, so he could hobble around quite well. About a year afterward, while out in the same field, at the place of the accident, "Watch" found his old foot and carried it home. He lay down on the grass near us with the remains of the old foot before him. The foot, tho dried, was so preserved that there was no doubt that it was the old foot. He seemed to want to get it to grow on again or wanted us to help him. His dejected, sad and sorrowful appearance was very impressive, and there was no doubt he was shedding tears.

J. M. EBERT.

GRENLOCH, N. J.

A Groundhog Case.

"Boss" was a mixture of English bull and Scotch terrier. I was living in Eastern Ohio, where groundhogs are plentiful. The groundhog's hole goes down at an angle of forty to fifty degrees to the proper depth and then turns slightly up for the last foot or two. My brothers and I had located one in his hole and had dug down about three feet and could just see the tip of Mr. Groundhog's nose as he squared himself for the fight. Then "Boss" was let in. He ran down and stuck his head into the hole, but could not turn his head up enough to get his mouth open and get hold of the groundhog. The result was that he came out with his nose all slit up by the groundhog's teeth. He cocked his head to one side and looked intently into the hole. Presently he snorted the blood from his nostrils,

turned deliberately over on his back and slid down into the hole head foremost, got a good hold on Mr. Groundhog, kicked and wriggled his way back up out of the hole as proud a bull-terrier as ever you saw.

I am willing to make affidavit to the truth of the above at any time, and it can also be verified by either or both of my brothers, still living in Ohio. THOMAS W. KEENAN.

SHENANDOAH, IA.

Getting Rid of a Rival.

Here is a little incident, to the exact, unexaggerated truth of which the members of two families will willingly make affidavit.

"Frisky" was just a little fluffy, ordinary dog, without a pedigree, and not credited with the possession of remarkable intelligence, but with two traits of character strongly developed—an inordinate desire for being petted and a most intense jealousy.

My son, who lived about two blocks away, had a pug pup which he frequently brought with him when he called on us. The pug, being at the cute and cunning age, naturally received a good deal of attention from the members of the family, much to the disgust of "Frisky." On one occasion my son and his wife had occasion to leave the city for a couple of days, and the pug was left in our care. "Frisky" tolerated, with a very bad grace, the company of the pug, and tried to appear indifferent to the attention his little rival received. This continued for two days, when he suddenly changed his tactics. He made friends with the little fellow, and, after gaining his confidence, lured him out of the house. Then engaging him in play, he enticed him, by degrees, away from the house until he had led him all the way to my son's residence, where he left him and trotted complacently home, seemingly much gratified in the fact that he had piloted away the object of his jealousy. J. W. WARR.

JOLIET, ILL.

The Handsome Duckling.

Some years ago, on a farm at Noroton, Conn., I had a young duck, spotless white and very pretty. My attention was drawn to this particular duck, first, because she always looked cleaner and neater than the other ducks, and secondly, because the other ducks were always persecuting her and always trying to ruffle her feathers. And after each fight the white duck would steer straight for the pond, where, standing at the edge of the water and using the water as a mirror, she would, in a few minutes, efface all traces of the fight and look spick and span again.

One day, to my amazement, this duck showed up with a black necktie tied around her neck, the loop hidden under the feathers but the bow showing straight in front. It certainly looked pretty, and I thought at first that some one had tied it on the duck for fun, but on examining the tie, I found that it was simply a short loop of heavy twine, which had, presumably, been pulled off a package without being untied, and which, I believe, the duck herself must have found and pulled over her head.

The jealousy of the other ducks was terrific, and the poor duck became more persecuted than ever. The necktie was always the chief point of attack, and the white duck would each time emerge from the fight with the bow twisted around on the back of her neck and the strings pulled out of shape. But each time —and I personally watched the performance more than ten times—she would go to her mirror, and, first of all, pull her beloved tie back into its right position; then pull at the strings until the bow was again tied just right, then smooth the neck feathers over the loop, efface all other traces of the fight and would then again show herself to an admiring world in all her glory.

This lasted for about three weeks. Then the other ducks succeeded in pulling the tie to pieces.

I may add, on my honor as a gentleman, that every word I have written represents my personal observations without any exaggeration. VIGGO C. EBERLIN.

NEW YORK CITY.

"He Followed Them to School One Day."

Time, about 5 o'clock p. m.; a hot summer afternoon. Place, Nelson, Mo., where I was a banker at the time. Dramatis personae, J. L. Woodbridge; a pet crow, nearly grown, and our house cat.

I was sitting on my east porch, my feet resting on the banisters, paper in my lap, resting after my day's work. Nobody else in sight, everything still and quiet. Our cat was asleep on the front steps, some ten feet away, on the second step from the ground, with her tail hanging over the edge of the step.

The crow was out on the lawn, under the trees, some thirty feet away, moving restlessly around, hunting bugs and mischief. It caught sight of the cat and the pendant tail, and by a series of long, quick hops, reached the cat and vigorously seized the tail in its mouth. The cat jumped some three feet straight up in the air, lit on her feet, and then gazed around with an astounded, dazed expression, to see how the trouble came about.

She soon located the crow, standing with its solemn, corvine expression just by; and then turned, and in slow trot started down the walk toward the gate. The crow started after, in a succession of slow hops; soon caught up, and as fast as he could do so, snapped at the tail of the retreating cat; keeping it up till the accelerated motion of the cat carried her out of reach. Then the crow quietly resumed his bug and mischief hunting.

When school commenced, a month afterward, that same crow soon missed the children. After some days, he located them at the school building half a mile away, by following them up. He spent most of his time (as he could fly well by then) over at the school house. He would perch on the lowered upper sash of the window; would frequently become

noisy, when he would be driven away by order of the teacher. One day he caught sight of some colored crayons lying on the teacher's desk, well back in the school room, and made a sudden dash from his perch on the window, seized a crayon, and flew out in triumph.

J. L. WOODBRIDGE.

MARSHALL, MO.

The Bachelor Maid Kissed.

That "Helen," our family cat, reasons, we think, to be proved by all her daily walk and clever "stunts." I might mention the indubitable evidence she gives of knowing and remembering people, and of regarding them with affection or the reverse. I might tell, too, how she has learned that sitting up like a little dog, with fore paws gently drooping, usually secures her what she wishes, or how, when this mute appeal is unnoticed, she walks forward on her hind legs, softly slaps you with one paw, and then backs away again to resume her pose of graceful patience. But probably the most noteworthy act of her life is the one which I am about to relate:

As her table manners are of the most ladylike character, she frequently eats her meals with the family, either in somebody's lap or seated in a chair of her own, with her paws resting politely on the table's edge. She was breakfasting in my lap one morning, when she so far forgot the prescriptions of etiquet as to reach up and seize the meat from the fork which I was conveying to my mouth. In shocked surprise I administered a very mild box on the ear by way of reproof, but the effect was beyond all proportion to the blow. She never seems to take to heart even very rigorous cuffs bestowed by the man of the house, evidently regarding them as a normal and salutary part of life's discipline (for her various vaudeville accomplishments have not been acquired without some "laying on of hands" by her master in the intervals of his professional duties). But corporal punishment applied by a guest, and that, too, a hitherto notoriously "easy mark" for all her cat blandishments, she recognized as an insult and an indelicate arrogation of family privileges. She jumped down from my lap, walked out of the dining room and out of the house, nor would she come in for another meal or approach me during the entire day. But after I had gone to my room, at bedtime, I was surprised by a plaintive "meow" at my door, and "Helen" entered. She held distinctly aloof, however, for some ten minutes, when I chanced to sit down upon a low chair to take off my shoes. She then slowly approached, walked around me a few times, still with melancholy little meows, but finally sprang into my lap, and then, placing a paw upon each of my shoulders, she put her mouth up to mine—precisely like a repentant child who would "kiss and make up." And when I had responded with such foolish endearments as the occasion inspired, she curled up and purred her satisfaction in my lap until I carried her down to her bed in the kitchen.

It was our first and last misunderstanding.

THE BACHELOR MAID.

My Horse and Dog.

When I was a very young man I began practicing medicine in a small country town, and as an assistant, I bought me a three-year-old, remarkably well bred colt. Having plenty of leisure, I took great interest in training this colt to do many things, and during the twelve years I used him he became more noted thruout the surrounding country than myself. He was an animal of remarkable intelligence, doing many things from training alone, and many which seemed to me to be the result of his development mentally by that system of training, and which I can only call reason, as he seemed to act on his own initiative, I call to mind several of these. The first I will mention was once when he was being led behind a wagon. In crossing a country bridge the hind wheels of the wagon broke one of the floor planks, and the piece dropped out, leaving a hole a foot wide and several feet long, across the bridge. I expected to see him act from instinct and pull back, or getting frightened put one or more feet in the hole. Instead he looked down quickly, hesitated an instant, and then jumped his two front feet over, stopped and waited until the wagon had moved forward, looking sideways all the time at the big hole, now between his front and back feet, and then when he had plenty of room in front, jumped his hind feet over. Those who have tried to lead a horse over a bridge with a hole in it will appreciate this. He made no effort to avoid going over. Another time I had bought a cow, and as the man from whom I bought her assured me she would lead, I got on my horse and went after her. She led all right, until I was several hundred yards from her home, then balked, and I could not pull her along; when I tried to drive her she would only drive toward her home, and soon worried myself and horse badly. I finally concluded to try to lead her on foot, as I knew my horse would follow. What was my surprise and satisfaction to see my horse *at once,* as soon as I took the lead, back his ears and attack that cow. She was so willing to lead then that I had to walk fast to keep ahead. In a short time we were far enough ahead of the horse for her to dare to stop again. As soon as he was near enough he again made his attack on her and continued to do so every time she stopped, until she was safely in my lot. He did this on his own initiative.

From boyhood I have loved to hunt. When a boy I had two dogs, one of them especially intelligent. When hunting rabbits this dog would invariably catch Brer Rabbit. His system was this: The two dogs coming to a small brier patch or brush pile, with as little noise as possible, this dog would run around on to the far side and stop, every muscle tense, watching and listening, every faculty wide awake. The other dog of slower ideas followed his hereditary instinct, and entered the thicket or nosed in the brush pile; of course, driving the game before him, to emerge and be captured by his more intelligent companion. Did this dog reason it all out?

Was it understood between them that the

active, quick little fellow was not to drive, but leave that part to the larger, slower one? At any rate that was their system. It is exactly the same system pursued by two human rabbit hunters. If reason in the human, what is it in the dog? W. O. LANGDON.

SPRINGFIELD, ILL.

The Ferocious Feline.

Two cats, fighting by daylight a battle royal, in a back yard, one defending his own territory, the other an invader from territory lying west across the street, upon which the premises fronted, were separated by a broom in the hands of a woman, mistress of the defending cat. The invader, frightened, and somewhat disabled, reached a line fence on the north and leaped over it into an adjoining yard appurtenant to a neighboring house, also fronting on the street mentioned. From this adjoining yard he had, as the defending cat must have known from long residence in the neighborhood, two avenues of escape that were better than any others, one leading east to an alley in the rear, the other, the direct route to his own home, through a passageway between the two houses reached by a gateway and leading west to the street in front. If the gate were open, as it usually was, the latter was the easiest and most natural way out, but the fugitive ran east to the alley in the rear, altho compelled to cross a second fence in so doing. His enemy, "neither lag nor lame," attempted to follow in direct pursuit, but was headed off by his mistress and the broom before he could reach the first fence, a solid board structure, thru which he could not see. The pursuing cat, finding his way thus barred and having no means of knowing which direction his enemy had taken, turned, without a moment's hesitation, and dashing thru a gateway, ran at the top of his speed along the south side and across the west front of the house, back of which the fight had occurred, to the mouth of the passageway mentioned, from which he evidently thought his foe was likely to emerge. Arriving at the strategic point, seeing nothing of the enemy and seeming to realize at once that the latter had taken another direction and made good his escape, he "smoothed his wrinkled front" and went about his ordinary affairs. Knowing by experience that his mistress would not hurt him, he was without the slightest fear of her and was certainly not moved by any desire to escape, when he ran around the house. The invader had often before crossed the street to do battle; and it seemed to be plain, at the time, that the defending cat anticipated a retreat along the usual line of advance, which was also the natural, and, under conditions then to be assumed, the easiest line of escape. The swift decision to seize the strategic point, the existing reasons for the maneuver, and its prompt execution, were all in evidence, and, it appears to me, warranted the same inferences that would have been drawn had the actor been human. Why or upon what ground the maneuver of the defending cat should be attributed to mere instinct, I am unable to perceive.

The accompanying diagram will make clear the military operations described.

W. F. SPOTTSWOOD.

KANSAS CITY, MO.

"Watch" and a Squirrel.

One day in early summer, a number of years ago, the writer, accompanied by another Williston student, rowed across the Connecticut River to observe a forest fire which was raging upon Mt. Holyoke.

It was here that our attention was attracted by the frantic chattering of a squirrel. We located the little animal, which proved to be of the common, red variety, where it clung to the trunk of a large tree. The reason for the squirrel's distress was at once obvious. A thin line of flame had crept up against the wind thru the moldering vegetation until now the squirrel's place of refuge was completely hemmed in. The squirrel evidently realized his desperate situation. Fortunately, the underbrush thru which the fire was creeping

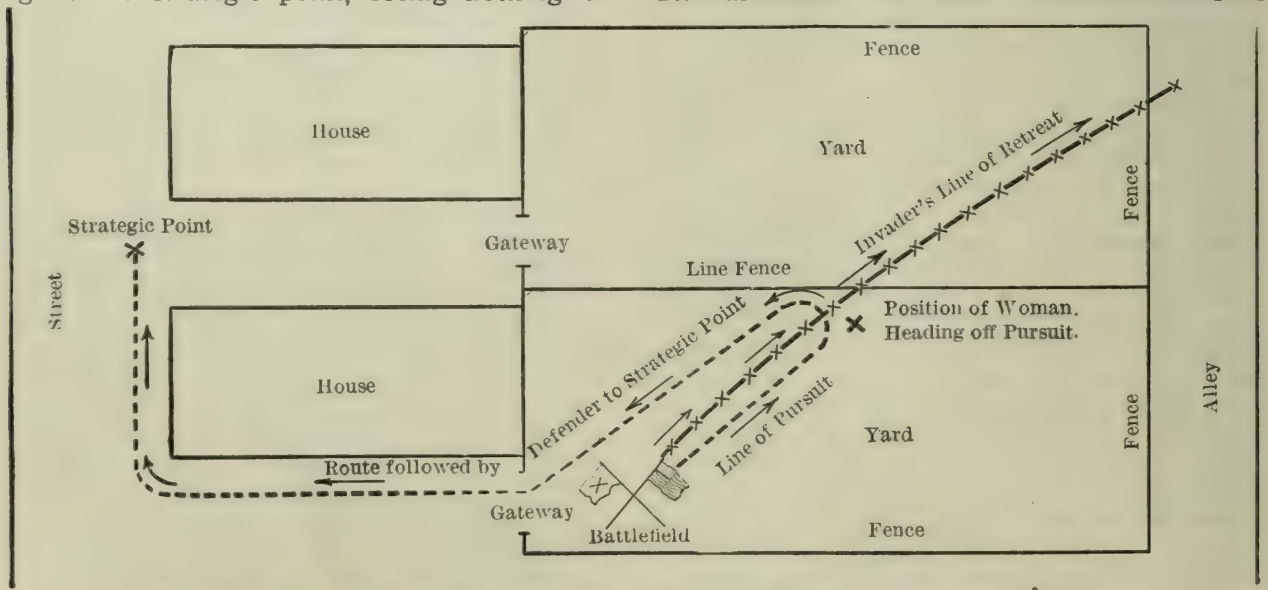

DIAGRAM OF THE BATTLEFIELD AND MANEUVERS OF COMBATANTS.
Drawn for THE INDEPENDENT by W. F. Spottswood.

was too green to burn readily, and a plunge forward, with a high leap over the flames, brought the writer, without undue risk, to the tree upon which the squirrel was marooned. At my approach the little animal sprang down upon my shoulder and sought refuge under the folds of my coat. It remained there perfectly quiet until we reached the hotel, where I placed it in a box prepared for its reception. It should be remembered that this was a wild squirrel, one of the hunted, with every instinct antagonistic to man. The animal was uninjured and apparently had not been affected by smoke. Yet I handled it without gloves and met with no resistance, nor did it attempt to escape.

Again, there was our dog, "Watch," a marvelous woodchuck dog and a wonderful fighter. I believe, when in his prime, he could have licked three times his weight in wildcats. He was of uncertain pedigree, a tawny, short-haired animal with mouse-colored jowls; weight, forty pounds; short, muscular legs, a tremendous chest and a body almost as long as a dachshund's. I have never seen one like him. I think he knew the location of every woodchuck hole in the whole countryside. He would watch patiently from a distance while the woodchuck engrossed with his clover fed further and further from home. At the proper time the dog, taking advantage of every tree, haycock or other obstruction, would work his way to within what he considered striking distance, and then make a dive for it. An ordinary dog would have darted straight for the woodchuck. This "Watch" never did. His sole objective was the woodchuck's hole. I have observed these stalkings many times, and it rarely happened that he failed to meet the rodent at the threshold of his lodgings and to return with the spoils. But "Watch" grew old and his killings less frequent. A heavy dog tax was levied upon the community. The New England conscience does not adapt itself readily to the maintenance of animals which have survived their period of usefulness. It was determined that "Watch" should be surrendered to the deputy sheriff who acted in the capacity of local dog catcher.

A sawmill three miles away formed one of the appurtenances of the old homestead. There was a family there who cooked for the mill hands and Canadian-French wood choppers. Here was a possible haven of refuge. "Watch" occasionally followed the teams from the farm to the mill and back again, but never spent the night there.

I gathered the old dog to my arms, the arms of a boy, and pleaded with him. "Go up to the mill, 'Watch,' and stay. They are going to kill you if you stay here. Go to the mill. Go to the mill and stay." I repeated it, over and over. I felt that I *must* make him understand.

That day "Watch" disappeared. No one chanced to be going to the mill for several days, yet a mill hand, who came to the house several days later, reported that "Watch" was there.

"Watch" never came to the home place again. A few weeks later he was killed in a fight with other dogs. It was just the sort of death the old dog would have chosen.

Why did he go to the mill and remain there? Did he understand and *reason*, or was it all blind chance; a mere coincidence?

FREDERICK W. HAWKES.

NEW YORK CITY.

"And the Dish Ran Away with the Spoon."

Our cow is a black Jersey, orphaned in babyhood, her mother having been killed by the cars. She had a stable in her pasture to which access was gained by turning an ordinary doorknob. In a very short time she learned to turn that doorknob with her mouth and the only way of keeping her in was to fasten the door with a hook on the outside. She soon put her knowledge of doorknobs to another use. When the flies begin to bother her in the middle of the day, she would go and open that door, walk in and shut it after her, there to remain in comparative darkness till the cool of the evening, when she would open the door and walk out again to feed.

Altho her tail is large and long, she seems to regard it as a secondary fly-brush, the more important one being a long leafy branch or corn stalk or tall weed held in the mouth and swung vigorously back and forth across the back, up and down the sides and around the front legs.

If hitched by a chain at her stall she would take it off as soon as left to herself. As she didn't make a nuisance of this ability, and we were afraid of increasing her difficulties for fear she might hurt herself we gave up hitching.

She was given provender in a pail placed in her manger. In eating it she always managed to spill a little into the manager, so, having lapped out the pail, she would take its bail in her mouth and toss the pail out behind her in order to get a better chance to lap out the manger. This, tending to daub and otherwise injure the pail, there ensued a struggle between us, which resulted in her setting the pail carefully over to the other side of the manger, which ended all trouble on that score. Her pasture is partly on a hillside, and when given anything in a pail and she sees the pail is in danger of going over, she will take it by the bail and place it on a more level spot.

When hitched out to feed by a nose-halter and chain, she would feed her circle, then, if not changed, she would, if the pin projected above ground, wind the chain round close to her nose and pull it up. Sometimes she could get loose and sometimes she couldn't, but if any one found her wound up, she would look so pathetic, that the only thing one could have the heart to do was to move her to a nice new grassy place.

The cow seems to understand a great deal more than one would suppose of ordinary conversation, and doesn't lack in ability to ex-

press her own thoughts and feelings. One day, for a wonder, when she was busily feeding at the other end of the pasture, I put some corn in her manger without her seeing me; but she saw me soon after and came up to see what I was about. Shelling beans didn't seem to appeal to her, altho she enjoyed my company; so she closed her eyes and went to chewing her cud, the most sleepy, inattentive looking cow one ever saw. Meanwhile I went on shelling beans and talking to the chickens, without her appearing to give the least attention. She looked so very inert that, speaking for my own amusement, without gesture or emphasis or any notion she would notice my remark, I said: "Mooly, there is corn in your crib, if you only knew it." The transformation was instantaneous. Opening her eyes, she turned quickly around and ran up the hill behind her to the stable, from which she didn't emerge till the last spear of corn was eaten.

All these doings show a motive connected in some way with the pleasure or amusement of the cow, but the act that made me think of writing this seemed to have no other motive than a love of order or a desire to assist me. My cow is extremely orderly and systematic. Everything that she has anything to do with has to be done just so. I had dipped her a large pail of water from the spring branch by means of a 10-pound corn-syrup pail, which had lost its bail, and fearing there was not enough I filled the syrup pail also, carrying them to where she was hitched out under a tree. When she had lowered the water in the big pail sufficiently, I poured in the water from the little pail, placing it a yard or more away on the other side of the tree and nearly at the limit of her chain and starting around the corner of the house for milking stool and pail. Returning, I found the little pail had been brought back from round the tree and placed right side up in the big pail. She had seen me stack pails that way when I had several to carry away, and had decided to help me that much.

East Chattanooga, Tenn.

The Comments of a Naturalist.

Sincerely do I hope that I may live to see the day when the great American public will know universally, and cheerfully admit, that regarding the intelligence of wild animals, ***the truth*** is much more wonderful, and also more interesting, than the cheap, claptrap inventions of the nature fakirs. The truth gives food for unlimited thought and reflection; the silly dreams of Long and his kind only sully the fountain of nature knowledge, and leave the believer with many things to unlearn.

The day is fast approaching when all naturalists will agree that the most interesting feature of any wild animal is its mind. The question: "Do animals reason?" is no question at all. It is idle to argue the existence or non-existence of a fact that is clearly evident to millions of intelligent persons. Of course animals reason—more or less—according to the mental capacity of the individual, just as men do.

Students of animal psychology must study the *principles of evidence*. They must learn to weigh testimony and to discriminate between cold fact and friendly imagination, but always bearing in mind that even in nature truth is stranger than fiction. At the same time, however, the sane mind must know that wild animals are less intelligent than human beings, that their knowledge is not superhuman, that they are not mind readers and that there are bounds beyond which their reasoning powers do not pass. And let all the world beware of the man who would have you believe that he knows the minds of wild animals as intimately as God Himself.

William T. Hornaday.

Winnipeg

BY SARA H. BIRCHALL

Hail, men! Upon my roughly paven streets
I feel the pressure of your eager feet,
The firmly planted feet of marching men
Turned westward to the wheatlands and the trail.
Hail! sons of England from the ancient isles.
Hail! men of Ireland's rainy, purple coast.
Hail! Yankee, ranchman, miner from the hills.
Hail! weary peasant shrinking from the knout.
Hail, men! from East or West, howe'er you come,
Bent beneath loads and knotted with long toil,
Or young and clear-eyed, with outreaching hands,
I give you welcome from my golden gates.
I give you welcome—welcome unto toil,
And freedom, and the illimitable sky.

Chicago, Ill.

Is Cupid a Convention?

BY CHARLOTTE PERKINS GILMAN

Author of "Women and Economics," "The Home," etc.

ARE we not somewhat obsessed by an exaggerated worship of the little blind god?

This fat child with a ribbon on—wingleted, and sometimes infelicitously crowned with a silk hat—is he not largely a convention, poetic and pictorial?

It is heresy to say so, no doubt, but we have been such daring and successful heretics in other lines, we need not fear a flicker of infidelity in this.

If the continual appearance of this engaging infant in our publications, either in ceaseless illustration or the as insistent reiterance of the "heart interest" in every story, is to be taken as any indication of the facts, then we should find our common daily lives continuously dominated by this one influence.

Are they?

Young people, while their first love affair throws the universe out of focus, would promptly answer "Yes!" and many older people, with some second, third or even later instalment of the tender passion causing them to commit mad antics on the front pages of newspapers, would doubtless agree with them—while the fit was on.

But these young people, married and settled, or these older people, laboriously divorced and triumphantly rewedded—do they not then find that life is many years long, and is governed by more than one impulse?

As a matter of fact the work a man does is his main interest in life; whether he is George Washington or John Smith.

Was our great first President, do you think, led by the nose by this shirtless darling with the bow and arrow?

That he may from time to time have acknowledged his presence is not denied; but is the proportionate weight of this one emotion, as compared with love of country, with the sense of duty, with friendship and legitimate ambition—as great as our popular convention would lead us to suppose?

The life of John Smith, on the other hand, may not be directed by such high aims as those of the Father of his Country; but the factor of business interest, of political aspiration, perhaps, and of devotion to his work, surely modify his life more continuously than the attacks of Dan Cupid.

We would wish to give even the devil his due; but venture to affirm that this young deity is overrated as an influence in human affairs, and that his presentation should be confined as a rule to a special field of picture, verse and fiction, and to his own peculiar vehicle—the Valentine.

With our amazing acquiescence in any well-expressed opinion, we have long meekly accepted the epigram "All the world loves a lover."

Ye-es—there is a sense of sympathy, also proverbially expressed—"A fellow feeling makes us wondrous kind." We sympathize with any universal feeling, and this is certainly universal. It is not limited even to humanity, but forms a dominating force in the development of species from the beginning.

Our distinction is that we have other factors in our uplifting; social evolution proceeds along lines far removed from those of the animals below us.

They breathe—and we breathe; they eat—and we eat; they are relentlessly governed by the force, airily typified in our robust infant archer—and we also fall under his sway.

But whereas they have nothing farther to modify them, we have the whole range of human feeling; the varied interaction of social forces, wider and stronger as the ages pass.

We are swayed by ambition, for instance, to a terrible degree; we are led around the world by the exploring passion, or held rigidly to earth by a natural submission to economic necessity.

The scientific spirit lifts us forward, the iron clamps of tradition hold us back; religion enlightens and advances us—sometimes; or we see whole nations dark and stationary under the same influence.

Such a great social force as education does more to advance humanity in a century than does Master Cupid in a thousand years.

Yet now has arisen a school of philosophers and advisers, who are convinced that what we need is to give way absolutely to the life force—so as to have better people born on earth. For these the Love-god would reign supreme, the ruling deity of life.

The poets, almost to a man (and largely followed by the women among them), maintain this tradition, the painters side with them to a considerable extent, and writers of fiction have built up a vast pile of literature in which there is no interest to speak of beyond the "old, old story."

This is natural enough; for the novelist is the lineal descendant of the bard and minstrel, the troubadour and trouvere of earlier days.

Those private retainers of great lords were naturally obliged to please their masters, and they sang the ballad and twanged the lute in celebration of the only interest of those feudal dignitaries —love and war.

The men fought and made love; the women were things to be fought for and made love to; the minstrel celebrated the prowess of one and the beauty of the other continually; and the novelist, for a long time, merely accepted this tradition of his art and followed it. But fiction is too great an art to be limited forever to one department of life; and in time arose such masters as Charles Dickens to give us something more than love stories.

Here was at last a story about human life—not merely one chapter in it; about people, all kinds of people, not merely lovers; and the immense and lasting popularity of his work rests on this fact. What we remember in Dickens's work is not the slender thread of "heart interest" which was woven in with many others, but the larger interests of the human heart, which appeal to us all from childhood to old age.

As this branch of literature develops it constantly widens its range of study and treatment; and there are many of the later workers in fiction who have turned their backs completely on the earlier convention, and given us book on book, of vivid power and beauty, in which there is no "heart interest" whatever. Stevenson and Kipling are splendid examples of this; and, in his own charming way, Frank Stockton.

The eager way in which a world of men seized upon these tales of life and people, life that went on before marriage, after marriage, or utterly without marriage, and all its preceding and succeeding emotions—this ought to be a lesson to the editor.

The success of a book like "David Harum" (with its tenuous and labored love story foisted upon it by the publisher), of "Mrs. Wiggs of the Cabbage Patch," of "Looking Backward," or, to take a still longer step, of "Uncle Tom's Cabin," these show that humanity is moved by more forces than one, and interested in their description.

We have a deep, unsatisfied hunger for expression that is not to be assuaged by the eternal twanging of one string.

One after another bursts out the problem novel and the problem play; one after another the magazines present new kinds of tales, tales of mining camps and South American speculation; of wild Western impostors and of amusing sailors of the United States Navy; of little Jews at school or the horrors of the meat business. Life today is far too big, too broad, too fascinating and swift in motion for us to be continually amused and kept quiet by the kind of story which satisfied a simpler age.

No one can study the progress of literature without seeing this, at least if they study fairly. Yet against this normal development of life and art stands the traditional attitude of the dealer in literary wares, be he publisher, editor or seller of newspapers. Some of our worst newspapers, actuated by precisely the common knowledge of the weaknesses and habits of the more primitive mind, incessantly smear the "heart interest" over the news of the day, like a poor cook with an onion. "The woman in the case" is exploited in headline and picture, exaggerated, distorted, invented bodily, to appeal to the only taste they recognize.

This morbid insistence on one life-motive is carried to its worst excess in the "decadent" school of writers, painters and musicians; an excess, a distortion which shows convincingly how weary is the world of what once amused and thrilled it.

The simpler love stories of earlier days now appeal only to children or to those whose novels are few and far between. Those who read many are inevitably wearied of a single monotonous theme, and demand other entertainment.

The entertainer unfortunately knows no other theme, and finding his confection appeal but dully to the jaded palate, he forthwith adds to the strength of the concoction, makes it richer, hotter, more highly seasoned. For a while this held us, only to produce the same weariness by its ceaseless repetition. Then the distracted confectioner, knowing no dish but this, finding it no longer popular, either weak or strong, proceeds to let it grow sour and stale—ferment to beady foam or horrible decay.

If we no longer want the love story simple and easy, they give us the love story complex and difficult. If we weary of it pleasant and satisfying, it becomes unpleasant and disappointing. If we tire of the natural and healthy, the virtuous and normal, then appears the unnatural and diseased, the vicious and abnormal of every degree.

Now, as a matter of fact, the world has made more progress than it is conscious of, and its awakening consciousness is dulled and retarded by the continued prominence of its antiquated conventions. The reason the American people move faster than others is precisely because they left behind them so many old customs when they came to the new land.

But the conventions of literature and art remained in force when those of politics and religion were laid aside; and the older countries often go beyond us in progress in those departments of life.

Still, we are willing to change when we see the line of advance, and if once our writers waken to the fact that social evolution brings new matter for description, and new tastes to appreciate it, they will pour forth good work in the new lines. Then the exploiter of literary labor must learn the same truth and enlarge his field of vision as to "what the public wants."

The main market for the fiction writer is changing fast. Time was when the young girl had no emotions or interests beyond the not impossible HE; and as for older women—they were not considered at all. Now we have an immense number of able-minded women, no longer "young," but by no means "old," just women, quite permanently women, as men are men.

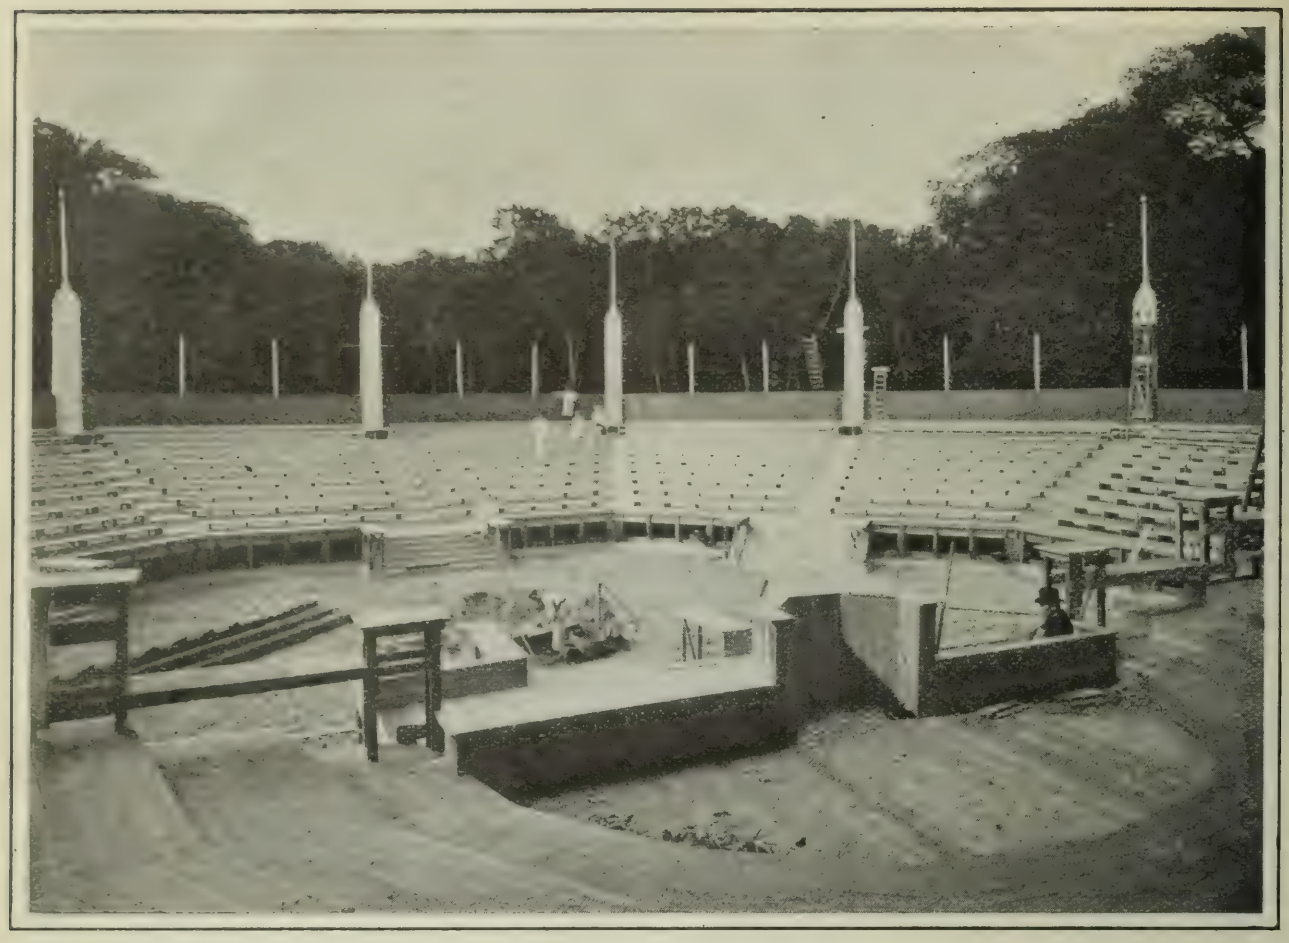
They like fiction, as we all do, but do not like it to treat only of one part of their lives—which indeed used to be all of them, but is so no longer.

Men also read fiction, and like it to present life—not a single part and always the same part, but life in general.

Even the young girl—"Little Ellie of the Swan's Nest"—has become a different person. There is a "lover on a red-roan steed" in her picture, no doubt, but he does not cover all the canvas.

She is interested in love stories, naturally, but she would like, if she had them, vivid tales of girls who established their independence; who amicably overruled shortsighted or selfish parents; who carried on successful friendships; who achieved success in their chosen professions, and then—blessing and crown of the personal life, attained love, too.

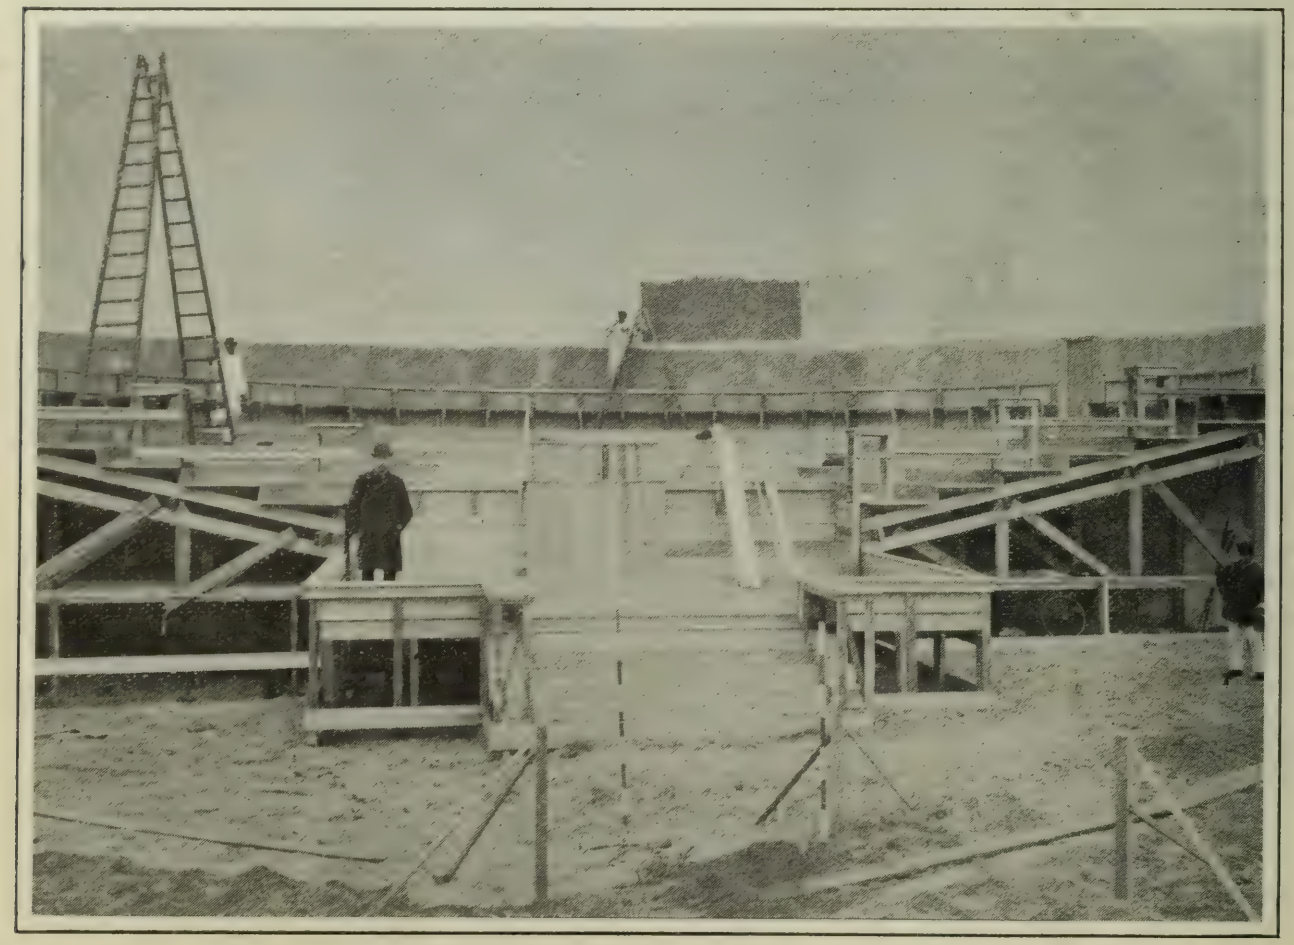
That is what we want. Not love as all of life—disproportionate, out of drawing, morbidly exaggerated; but love as part of life, center and foundation of the personal relationships, and necessary base for the larger and more engrossing social relationships.



The further development of humanity naturally depends on harmonious, healthful and happy conditions for individuals; but a modern human being, a civilized human being, is overpoweringly compelled to be in his right place in the social order; to be doing the right work in the right way; to help society up, not hold it down; and such a being cannot say with the poet that "Love is enough."

It is not enough. It is essential; but so is food or sleep or air to breathe—absolutely essential, but by no means enough.

It is no longer true, if it ever was, that the happy lover, attaining the beloved object, should count "the world well lost" for that great end.



The world is the main object; to know it, to love it, to serve it wisely and nobly; and in this great work of life our little friend Cupid is a means—not an end.

NEW YORK CITY.

THE AMPHITHEATER WHERE THE CEREMONIES TOOK PLACE.

The workman in the center is preparing the foundation for the cornerstone on the spot where it was during the ceremony, and near the spot where it will finally remain. At the first pole on the left sat the Dutch Government officials and Parliament, at the second representatives of the press and members of The Hague Court, and at the others the members of the Peace Conference.

THE AMPHITHEATER ON THE SITE OF THE PEACE PALACE.

President Karnebeck standing on the spot where his address was delivered.

The Cornerstone of International Peace

BY HAYNE DAVIS

Secretary of the "International Conciliation" Society

THE cornerstone of the International Court House was laid symbolically at The Hague in the afternoon of July 30th, 1907.

The building which this event foreshadows is generally called the Peace Palace. It is really an International Court House, and deserves to be called by its true name, in order to fix the world's attention upon the things that will really prepare the way for enduring peace.

This need is emphasized by the fact that the cornerstone was not actually laid, but only symbolically. Why? Because they do not yet know exactly the spot on which it must be laid. Neither have the governments or their representatives at this Conference discovered the particular idea that will enable them to establish justice and to maintain permanent peace. But they will both discover and utilize this idea in due time.

This symbolical laying of the cornerstone took place on the premises purchased by the Dutch Government for the Palace of Peace. Mr. Karnebeck, the president of the committee in charge of the fund provided by Mr. Carnegie for the construction of this court house for the nations, delivered an address to one of the rarest assemblies ever held, under conditions absolutely new. Between the speaker and the audience stood the huge block of Bavarian granite, upon which the following words were chiseled and then inlaid with gold leaf:

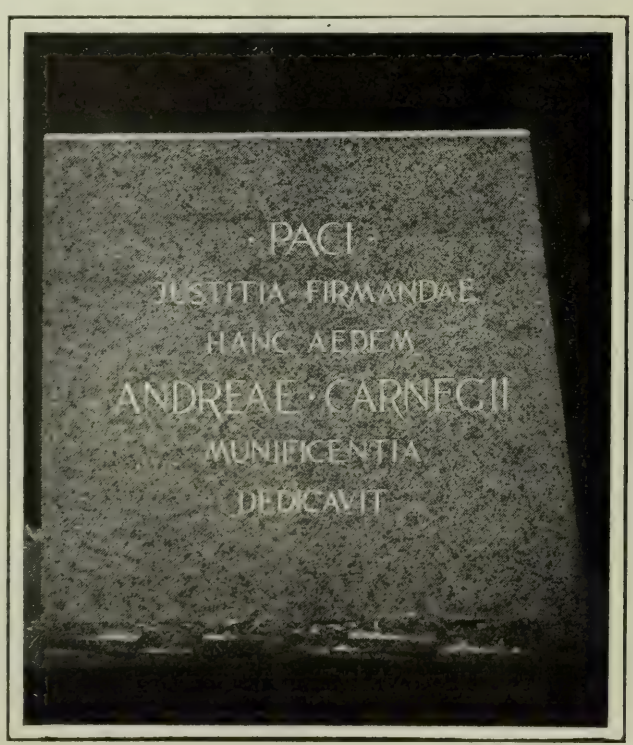
PACI
JUSTITIA FIRMANDAE
HANC AEDEM
ANDREAE CARNEGII
MUNIFICENTIA
DEDICAVIT

On this stone, when the exact site of the Peace Palace is agreed upon, the International Court House will be reared. It will be the first international building ever constructed by men. For this interesting and historic ceremony a special amphitheater was constructed, seating over a thousand people.

At the right of the speaker sat all the

PALACE OF THE SAXE-WEIMARS.
This is to be torn down when the Peace Palace is erected. It is on the land just back of the Peace Palace site.

THE VIEW FROM THE SPOT CHOSEN AS MAIN ENTRANCE TO THE GROUNDS.



This photograph is taken in Scheveningen Weg, ten minutes by trolley from the center of The Hague and from Scheveningen. It is only fifteen minutes' walk from the Hall of the Knights, where the Conference is being held, and one passes the Queen's Palace on the way.

diplomats accredited to the Dutch Government and the ladies of their households.

Next to them were all the delegates to the Second International Conference at The Hague, accompanied by their secretaries and the attendant ladies.

Next to the members of the Conference places were reserved for members of the Hague Court and the representatives of the press.

The representatives of the press were, therefore, in the very center of the amphitheater, exactly opposite the speakers' platform.

THE CORNERSTONE OF THE PEACE PALACE.

Next to the members of the Hague Court were the gentlemen who compose the Dutch Government at this time, and the rest of this entire section was completely filled by the members of the Dutch Parliament.

In the section directly opposite the diplomatic corps and at the left of the speaker were the members of the Municipal Government of The Hague.

On the platform with President Karnebeck were the other members of the Carnegie Foundation, namely, Von Citters, Savornin Lohrman, Ruysenaers, de Beaufort.

Savornin Lohr-

man has acted as a judge in one of the cases tried by the Hague Court. De Beaufort was a member of the first Hague Conference and is also a member of the second.

With these on the platform was Nelidoff, president of the Peace Conference. Back of the platform was a chorus of over 200 voices, which sang the songs of the nations in a manner to inspire the most lethargic and to energize the most skeptical.

M. Van Karnebeck concluded his address with these words:

"This is to be a palace of international justice founded as an outcome of the need of every civilized community to institute the rule of right for the rule of might. In this palace no one will be stronger or no one weaker than the other, and no other blade except the sword of justice will be placed in the scale. The tower of the palace will point to the stars, indicating the ideal of our efforts."

In a speech that preceded the actual laying of the stone, M. Nelidoff expressed the gratitude of the peace delegates to the munificent donor of the palace and to the Netherlands Government for the gift of the land upon which the edifice is to be erected. The speaker referred to the antiquity of the worship of war, and said there had never been a "cult" of peace in the world. Of all the precepts preached by the Savior nineteen hundred years ago the idea of peace has been the most neglected. He then said in conclusion:

"To make this idea triumph—and the honor therefore accrues to the Emperor of Russia—the Governments of the world must agree to study in common a means of making universal peace a reality by seeking every possibility of assuring its maintenance. I venture to say that this new 'cult' has been established in the world, and it is Andrew Carnegie, inspired by the great humanitarian idea springing therefrom and the good it promises to the world, who conceived the idea of dedicating this 'cult' a special edifice, which he is fully justified in calling a 'temple of peace.' Let us wish that this 'cult' spread more and more, both among Governments and peoples, and that the monumental tower which will crown this edifice will like a lighthouse, point out to the nations the road of right and justice."

By the courtesy of President Karnebeck I was permitted to make some photographs of the grounds, so as to let

THE PEACE PALACE ARCHITECTS AND THEIR ASSISTANTS.
Taken on the grounds near the cornerstone. Van der Steur, of Holland, third from the left, and Cordonnier, of France, fifth from the left.

the readers of THE INDEPENDENT have a timely view of this great event. Without prearrangement, at the hour fixed for taking these photographs, the architect who is building the Peace Palace, M. Cordonnier, of Lille, France, and his Dutch assistant, Van der Steur, from Haarlem, arrived upon the scene, and were kind enough to let themselves be taken in some of the scenes. Mr. Karnebeck also gave over his pressing duties long enough to have his photograph taken on the spot where he delivers the address at the laying of the cornerstone.

The members of this present Conference or of some future Conference will discover the idea on which a true Palace of Peace can be constructed as surely as Karnebeck and Cordonnier will definitely locate the place for the International Court House.

The signs of the times indicate that this present Conference will declare for the periodic and automatic assembling of an International Conference. Its members, in that case, will leave this symbolic laying of a granite cornerstone to lay actually in mind the foundation stone of a world's political organization, upon which the temple of Justice will arise, in which provision is made for a congress to declare the law which the Court of Nations must apply to particular questions.

After that the day of peace will really dawn.

THE HAGUE, HOLLAND.

The Smithsonian Institution

BY CYRUS ADLER, Ph.D.

[Dr. Cyrus Adler, assistant secretary in charge of the Library and the Bureau of International Exchanges, one of the most important branches of the Smithsonian Institution, and a curator in the National Museum, has been a leading and most efficient officer of the Institution for many years. With the approval of the new secretary, Dr. Charles D. Walcott, he has prepared the following interesting paper upon the history, scope and purposes of the Institution, which is one of the most comprehensive and valuable, not only in the United States, but in the world.—EDITOR.]

VARIOUS circumstances have combined recently to bring the Smithsonian Institution more prominently before the newspaper and magazine reading public than is customary in the case of a scientific establishment, and I welcome the opportunity afforded by THE INDEPENDENT to correct certain prevailing misapprehensions, and to furnish, as far as is possible in the limited space of a single article, some idea as to what the Smithsonian Institution is, what it does, how it does it, and who is responsible for its work.

According to popular conception the Smithsonian Institution (almost always incorrectly called Institute) is a large picturesque brown building of Gothic construction with Norman towers—beautiful, moreover, by reason of the splendid park in which it stands and the broken skyline, so infrequent in the public buildings in Washington. It is supposed to be filled with curiosities and a large body of venerable professors, who are engaged in making discoveries when they are not answering questions propounded to them by the citizens of this republic and the inhabitants of other countries. This interesting and alluring picture does not give an entirely accurate view of what the Smithsonian Institution really is.

In law it is termed an establishment (not a corporation) named the Smithsonian Institution, which establishment consists of the President of the United States, the Vice-President, the Chief Justice, and the members of the Cabinet. This establishment, and other agencies for the conduct of the Institution, which will be described later on, are provided for in a law passed by Congress on August 10th, 1846, which is the law upon which the Institution rests.

This Institution was rendered possible by the will of James Smithson, who died

in 1829, and who bequeathed the then relatively large sum of over a half million dollars, under certain contingencies, to the United States to establish an institution to be known as the Smithsonian Institution, for the increase and diffusion of knowledge among men. Smithson was a British subject who died in Genoa. He was a chemist and mineralogist of some distinction, who never visited the United States, and as far as is known, had no acquaintance with any American.

Several years were spent in the necessary litigation in the English Court of Chancery, conducted with great skill by Richard Rush, and nearly ten years were devoted by Congress to a consideration of the question as to whether the trust should be accepted at all, and if so, in what way it should be applied. The most distinguished public men of the day in both the Senate and House of Representatives debated this subject, and the foremost scientific and literary men and educators of the time were invited to express their opinions, all of which were carefully digested. It is evident that Congress, having once made up its mind to accept the trust, feared that if some immediate interpretation were not put upon the purposes of its acceptance, the money might be frittered away and result in no single important activity.

It accordingly decided, first, that the establishment should be as above specified. This, be it remembered, was at a period when the demands upon the time of the President and other distinguished officials named were by no means so pressing as now; and this establishment did meet from time to time, but for nearly thirty years it has had no meeting, and except for the very important function of being the legal holding body of everything that has grown up under this trust, it has virtually ceased to exercise any supervision over it.

The direction of the policy and the general government of the institution is in the hands of a board of regents, a board composed of two of the members of the establishment (the Vice-President and Chief Justice of the United States), and twelve other persons, three of them being Senators appointed by the President of the Senate, three Representatives appointed by the Speaker of the House, and six citizens of the United States appointed by joint resolutions of Congress, two of whom must be residents of the City of Washington, and the other four inhabitants of some State, but no two of them of the same State. This body chooses its own presiding officer, who is the chancellor of the Institution, and who in every case but one since the beginning, has been the Chief Justice of the United States; and it elects an executive committee.

The bodies spoken of above have as their secretary an official who is known as the secretary of the Institution, who, under the original law, had charge of its library and its museum, and thru the course of time has gradually succeeded to the performance of such duties as would be combined in the person of the perpetual secretary of an institution of learning, the president of a university and the director of a great scientific establishment. In other words, for all directing and executive purposes, the secretary is the head of the Smithsonian Institution.

Since its organization, a little over sixty years ago, four men have occupied this office.

Joseph Henry (1846-78) had been a professor at Princeton, was a preat physicist and the discoverer of the electromagnet whence have resulted all the important applications of electricity to the arts. He was one of the most powerful scientific leaders that this country has ever produced; to him fell the work—never to be equalled in opportunity by that of any of his successors—of organizing the Institution, which in view of the breadth of the foundation, in the hands of a weak, incapable or undecided man, however great his scientific knowledge, might have readily been scattered in so many directions as to produce no definite appreciable result in any one of them.

Spencer Fullerton Baird succeeded Professor Henry, serving from 1878 to 1887. He had been an assistant secretary for many years; was a great naturalist, the real founder of the National Museum, and the creator of the U. S. Fish Commission.

Samuel Pierpont Langley was the third secretary, holding the office from

1887 to 1906. He was a physicist and astronomer who studied the physics of the sun upon new and original lines with instruments devised by himself, and which now have world-wide use; he more than any other man placed the subject of aerial navigation upon a scientific basis and contributed toward the actual solution of the problem of mechanical flight. Under his administration, the National Zoölogical Park, and the Astrophysical Observatory were founded, and placed under the charge of the Institution, and the idea of the fine arts, for many years in abeyance, brought forward and given standing as one of the objects of the Institution.

CYRUS ADLER.

An institution for the increase of knowledge is the sum total of the abilities of the men who compose it, neither more nor less. Buildings, laboratories, libraries and equipment of all sort, important as they may be, do not constitute an establishment of learning. These three men, intellectual giants of their day, each one of whom will undoubtedly have a permanent place in the scientific thought of all time, represented a standard of distinction which successively has certainly never been surpassed by any other institution of learning, if, indeed, it has been equaled.

Within the present year, the board of regents have had the difficult task of selecting the fourth in this distinguished line, and their choice has fallen upon Charles Doolittle Walcott, distinguished for his paleontological and geological researches, for his wide knowledge of the natural resources of the United States, and for his strong record as an administrative officer in charge of the great Geological Survey of the nation. He was for a year and a half an assistant secretary of the Institution, and has been for nearly twenty-five years connected with the Museum, and he comes to the exalted post with a clear knowledge of the workings, the traditions and the needs of the Institution.

There is probably no point upon which there is more confusion in the public mind than that of the activities of the Institution proper, and the funds from which these must be carried on.

The Smithson bequest, with accumulated interest, now amounts to $650,000, to which has been added gifts and bequests (notably those of Thomas G. Hodgkins, of $215,918.69)—making the total Smithsonian Fund in the United States Treasury at present, $944,-918.69. Upon this fund, and up to one million dollars, the United States has agreed to pay, in perpetuity, interest at the rate of 6 per cent. per annum. Other investments bring the capital of the Institution up to about one million dollars. Out of the interest on these funds, in round figures, a little less than $60,000 per annum, must be paid all the expenses of the Institution proper, since no Government grants are made directly to it for its general purposes, but only for specific objects which will be described later.

The Institution has aided numerous investigators by making grants for research and exploration, supplying books, apparatus and laboratory accommodations. It has conducted lectures which have afterward been

published. In its early days it undertook the collection of meteorological data for weather forecasting, and it prepared the first daily weather map ever brought together in the world. Its work in this field, after being conducted beyond the experimental stage, was transferred to the Signal Service of the United States Army, and afterward resulted in the establishment of the United States Weather Bureau. It likewise undertook the initial investigations on the food fishes of the country, which resulted in the establishment of the United States Commission of Fish and Fisheries, now the Bureau of Fisheries. It is called on by the Government to advise in many matters of science, more especially when these have an international aspect. It has co-operated with scientific societies of national scope, like the National Academy of Sciences, the American Historical Association, the American Association for the Advancement of Science and others, and has stimulated the growth of a number of the Washington scientific societies.

The Institution has issued publications of great value in several series, mostly to convey to specialists the results of original scientific investigations, and thus to represent the first half of its fundamental purpose, "for the *increase* of knowledge," and, subordinately, others including handbooks and indexes useful to students, and some publications which, while still accurate, contain much information in a style to be understood by any intelligent reader, and thus represent the second half of the founder's purpose for the "*diffusion* of knowledge." The publications together form a library which comprehensively shows the advance of science for the period they cover.

Of these, the popular series known as Annual Reports contain numerous papers of general interest, intended to keep the ordinary reader abreast of the progress of science. These, tho prepared at the expense of the Institution, are published at the Government Printing Office, and the aid thus given is the single assistance on the part of the general Government toward the conduct of the parent Institution. Another series known as the Smithsonian Contributions to Knowledge, of which thirty-two volumes have appeared, is issued in quarto form, and the distinctive feature here is that each memoir constitutes an original contribution to knowledge. Almost every field of science is represented in this publication. The third series, known as the Smithsonian Miscellaneous Collections, of which forty-eight volumes have been printed, appears in octavo form. These contain bibliographies, reports of expeditions and standard tables, and since 1902 some of the papers of this series have been issued in the form of a scientific quarterly. The publications of all these series are distributed gratuitously to important public libraries thruout the world.

Under the Hodgkins Foundation, a portion of which was intended for the increase and diffusion of knowledge in regard to atmospheric air in its relation to the welfare of man, numerous investigations have been undertaken and medals and prizes awarded, the most notable being a prize of $10,000 to Lord Rayleigh and Sir William Ramsay, for their discovery of the element "Argon" in the atmosphere.

One of the important features of the Institution is the library, numbering over 250,000 volumes, consisting mainly of transactions of learned societies and scientific periodicals, secured initially by purchase, but now regularly added to by way of exchanges with numerous universities and other institutions at home and abroad. Since 1866 the main portion of this library has been deposited in the Library of Congress, thus enriching the national collections. A small working library has been brought together in the Institution. Library methods and scientific bibliography have been greatly furthered by the Institution, and many valuable lists and bibliographies, and rules for cataloging, have been published. Since 1901, the Institution has acted on the part of the United States as one of the component bureaus of the International Catalogue of Scientific Literature, with headquarters at London, which prepares and issues annual volumes of indexes to the literature of natural and physical sciences.

The Institution has, for a number of years, supported a table in the Biological Station at Naples, to which qualified in-

THE SMITHSONIAN INSTITUTION.

vestigators are admitted free of cost to them.

In 1897, as marking the first half-century of the Institution, a splendid work was issued, giving its history and achievements for that period. The parent Institution and each branch of it was fully described, and appreciations of its work, by men of distinction in the main not connected with the Institution, were contributed in the departments of physics, mathematics, astronomy, chemistry, geology and mineralogy, meteorology, paleontology, botany, zoölogy, anthropology, geography and bibliography, as well as in its co-operation with other institutions of learning and its influence on the development of libraries, the organization and work of societies, and the publication of scientific literature in the United States.

Such a record obviously cannot be reproduced in the limitations of this brief article, but it explains the primacy of this Institution, not only among the scientific establishments of this country, but the world over.

The parent Institution has six branches of activity which are supported by Congressional appropriations: the National Museum, the International Exchanges, the Bureau of American Ethnology, the National Zoölogical Park, the Astrophysical Observatory and the American Bureau of the International Catalogue of Scientific Literature, the last having been already briefly alluded to, and the others, each of great importance, being here but inadequately described because of the limits of space placed upon this article.

The Smithsonian Institution is the custodian, and the only lawful place of deposit, of all objects of art and of foreign and curious research, and all objects of natural history, plants and geological and mineralogical specimens belonging to the United States. These collections are known as the National Museum.

The collections of the Museum are especially rich in the natural history, geology, paleontology, archeology and ethnology of America, and also include many other subjects such as American history, ethnography, and collections relating to fine arts and the industrial arts. The Museum is both an educational and research institution, the exhibition series

being specially well arranged and labeled from an educational point of view, while the study series form the working basis for numerous investigations both on the part of the Museum staff and by many scientific men in the United States and abroad.

One of the fundamental objects prescribed by the Act of Congress founding the Institution was the establishment of a Gallery of Art, a portion of the Smithsonian Building being especially designed for this purpose. In 1849 a very valuable collection of etchings and engravings belonging to George P. Marsh was purchased, and a gallery was maintained until 1865, when the prints and engravings were deposited in the Library of Congress, and later the other art collections were placed in the Corcoran Gallery of Art. These, however, were in the main recalled from both places in 1896, and re-exhibited at the Institution. In 1906, Charles L. Freer conveyed to the Institution his valuable art collections, including many paintings by Whistler and four other American artists, numerous etchings and engravings by Whistler, and many examples of Chinese and Japanese art, as well as a large collection of Oriental pottery. In the same year, as the result of a judicial decision, the Institution was declared in law and in fact to be the National Gallery of Art, thereby securing the small but choice art collection of Harriet Lane Johnston, including examples of the greatest English portrait painters, and a number of historical objects. In March of the present year, the National Gallery was further enriched by the gift of Mr. William T. Evans, of Montclair, N. J., who presented to it fifty paintings representing some of the best of the work of American artists. These paintings are now on exhibition in the large atrium of the Corcoran Gallery of Art, thru the courtesy of its directors, until a suitable place shall be provided for them in the Smithsonian Institution.

A system of International Exchanges was begun in 1850 for the free interchange of scientific publications between institutions and investigators in the United States and those in foreign lands. In 1867 Congress assigned to the Institution the duty of exchanging fifty copies of all public documents of this country for similar documents of foreign nations, and this number was, in 1901, increased to a hundred sets at the option of the Librarian of Congress. In 1889, a definite treaty, made previously at a convention at Brussels, was formally proclaimed by the President of the United States, wherein the United States Government with a number of others undertook the continuation of the exchange service on a more extensive basis. Out of this has grown the Bureau of International Exchanges, for the maintenance of which Congress provides by annual appropriation. The total number of correspondents benefited by this service is 56,314, and from 1850 to 1906, 2,748,852 packages were handled by it. This service furnishes one of the many means adopted by the Institution to fulfill the wish of its founder—the "diffusion" of knowledge.

The Bureau of American Ethnology is an outgrowth of researches beginning early in the history of the Institution, which has, from the outset, devoted much attention to the study of the tribes of American Indians. It took its present form thru Congressional appropriation in 1879, and has collected a large amount of data relating to the habits and customs, the laws, the religions, the languages, and the physical characteristics of the aborigines of this continent. It has published twenty-five reports and thirty-one bulletins, and has a great amount of unpublished material, including hundreds of vocabularies. Besides doing a considerable amount of archaeological work, it has made important additions to knowledge, and also invaluable collections.

The Astrophysical Observatory was established in 1890, and was under the immediate direction of the late secretary, S. P. Langley, who here continued researches previously begun at the Allegheny Observatory. These investigations of solar radiations, made possible by Mr. Langley's invention of the bolometer, have resulted in the production of a complete map by an automatic and absolutely trustworthy process which shows at the unknown region or invisible spectrum the lines that resemble the so-called Fraunhofer lines in the upper spectrum. The study has been especially directed to that region of the spectrum which in-

cludes the greater portion of all those energies of the sun which affects, thru its heat, the climate and the crops.

The National Zoölogical Park was established by Congress in 1889 for the advancement of science and the entertainment and instruction of the people. The park is situated on Rock Creek, two miles north of the center of Washington, and has an area of 167 acres. It is amply supplied with water and its surface is of a varied and picturesque character. The collections comprise about 1,400 animals.

As an indication of the growth of the Institution proper and its branches, it may be stated that in 1852 the force, including scientific assistants, numbered twelve, while at the present time the scientific staff numbers eighty-two and the administrative and other forces 324, a total of 406.

WASHINGTON, D. C.

War Explosives

BY HUDSON MAXIM

[Mr. Maxim, in 1883, took up the business of ordnance and explosives and is now one of the world authorities on these subjects. He was the first to make smokeless powder in the United States. In 1901 he sold to the Government the formula for "Maximite," the first high explosive to be fired thru heavy armor plate. He has recently perfected "Stabillite," and is now working on an automobile torpedo called the "Hudson Maxim," and numerous other inventions. He has taken out over fifty patents, and is a member of the Society of Chemical Industry.—EDITOR.]

AN explosive is a body whose elements are capable of reacting with one another with the evolution of gas and heat.

Explosives generally consist of some combustible element or elements and some oxidizing elements capable of furnishing the oxygen to burn the combustible elements. In some explosives, as in ordinary black gunpowder, the combustible elements, charcoal and sulfur, are simply mechanically mixed with saltpeter, the oxidizing element. In nitroglycerin and in guncotton, however, the combustible and oxidizing elements are chemically combined.

When the combustible is carbon, a carbo-hydrate or a hydro-carbon, the products of combustion with oxygen being gaseous and highly heated by the reaction, a powerful explosive is formed, the force of the explosive depending upon the rapidity which with the explosion takes place, the volume of gases set free, and the temperature of the gases, because the hotter the gases are the greater will be their expansive force—in other words, their explosive force.

Explosive compounds are burned in two ways—one by combustion from surfaces exposed to a consuming flame, the other by what is called detonation, by which the explosive is consumed nearly instantaneously thruout its mass by a wave action.

Combustion from surfaces requiring an appreciable time for the consumption of the explosive body adapts it to use as a gunpowder. The detonative form of explosion adapts a body to shattering or disruptive purposes, and unfits it as a gunpowder. Such detonative compounds are termed high explosives. However, the function of an explosive, whether as a combustive or a detonative compound, is very largely determined by its physical character, temperature and the conditions of confinement under which it is fired.

By making an explosive compound dense and hard, its susceptibility to detonative influence is lessened, owing to the increased work imposed upon the reaction in overcoming the force of cohesion. Similarly, the adulteration of an explosive body with another and non-explosive body lessens its susceptibility to detonative influences, owing to the

energy required in breaking up the foreign body.

Guncotton, now commonly known as nitro-cellulose, is made by treating cotton fiber, generally cotton waste, with concentrated nitric acid, mixed with sulfuric acid, to absorb the water set free by the reaction of nitration. Guncotton consists of a mass of small tubular fibers, the thin walls of which are composed of a hard, vitreous colloid. Owing to this fine state of division, masses of guncotton are easily detonated with great violence, which enables us to class guncotton among the most powerful high explosives.

Dry compressed guncotton can be ignited in considerable quantity and burned quietly away without detonation. If, however, a sufficiently large mass be fired, the localization of heat and pressure upon the surface of the burning body, owing to the energy required to displace the products of combustion as fast as set free, will cause the whole mass to detonate.

If guncotton be dissolved in acetone or a mixture of ether and alcohol and dried, it is well known how the hard and hornlike product resists detonative influences. However, if reduced to a fine powder, its susceptibility to detonation is restored, or, if redissolved in acetone and poured into water in a fine stream, a fluffy, fibrous material is formed, resembling very closely the original fibrous guncotton which will detonate with equal ease and violence.

The hard and hornlike colloid formed by guncotton when dissolved and dried adapts it for use as a smokeless gunpowder, either in a pure state or combined with other substances. The present service smokeless cannon powder of the United States Government consists of a soluble form of guncotton known as pyro-nitro-cellulose, which is gelatinized by a mixture of ether and alcohol, and squirted thru dies of various sizes, according to the size of grains required for guns of different calibers, the strips being cut into suitable lengths and dried.

Cannon powder is not a powder at all. The term powder in this application is a misnomer. Explosive compounds employed as propelling agents for throwing projectiles from guns, instead of being in pulverulent form, consist, on the contrary, of large grains or strips of solid material, varying from a quarter of an inch to more than an inch and a half in thickness, and sometimes, as in the case of cordite, sticks of explosive material are employed three feet or more in length.

Altho a charge of powder in a gun is consumed with such rapidity as to appear to our senses instantaneous, still it is far from being so. A grain of smokeless powder is consumed within one sixty-fifth of a second, but its combustion takes place entirely from the surface and progresses with the most perfect regularity. Its combustion is similar to that of a piece of wood in the fire, only the combustion of the powder grain is infinitely more uniform.

The first smokeless powder to be adopted by the United States Government was the Maxim-Schüpphaus longitudinally multi-perforated cylindrical grain, which, by burning with an increasing area within the perforations, accelerated the rate of combustion as the projectile moved along the bore, and served to maintain the pressure behind the projectile in its flight thruout the entire length of the gun better than had been done before. This multi-perforated grain is still used by the Government, altho the composition of the powder has been changed. I have recently obtained a United States patent for a powder grain made in the form of long flat strips and multi-perforated in such wise that the minimum initial area per unit of weight is presented to the flame of ignition, and the maximum area per unit of weight presented at the instant before the complete consumption of the grain.

The great popular dread of high explosives has led to many wild misconceptions of their force and their danger. Many a poor anarchist has reaped bitter disappointment when a few pounds of dynamite have failed to destroy the Houses of Parliament or London Bridge, or to demolish a city block, while the wag confidently repeats the old story of the man who blew himself up by kicking the dog that ate the dynamite.

The erroneous belief is still prevalent that airships, when they shall have been made practical, will be able to work as-

tounding destruction by dropping cargoes of dynamite from the sky. As a matter of fact, a hundred flying machines attacking New York at once, each carrying half a ton of dynamite, could succeed only in breaking a few windows, somewhat damage a few walls and killing a few people.

Dynamite, when exploded without confinement, can do but little damage. It is when properly confined that it can work destruction in freeing itself from confinement. When exploded on the surface of the ground without confinement, it simply kicks a hole in the ground, as the gases rebound upward into the air on the lines of least resistance.

Even a high explosive projectile does but little damage employed against bodies of men, for the reason that the projectile, in penetrating the earth, exhausts its energy there, while if it lands on the surface of the earth and explodes on impact, the fragments are hurled mainly upward in the form of an inverted cone and but little damage is done in the horizontal plane.

Some of the early attempts to fire high explosives from guns are now seen to have been very ridiculous. The famous pneumatic gun, on which the United States Government wasted large sums of money, was about as absurd as any of them.

It was thought in those days that the main object was to get the high explosive out of the gun gently, so that it would not be exploded by the shock of acceleration. The aim of the inventive genius was to adapt the gun to the explosive, instead of to adapt the explosive to the gun.

I was the first, I think, to take up earnestly the adapting of the explosive to the gun. At any rate, maximite was the first high explosive to be successfully fired thru heavy armorplate to be exploded after passing thru instead of upon impact.

Maximite, being a Government secret, I shall be unable to say anything about its composition. I may say, however, that it has an explosive force about 50 per cent. greater than ordinary dynamite, and still it is so insensitive to shock or percussion that when charged into projectiles it is capable of withstanding as great a shock upon the plate as the projectile itself is able to stand.

That is to say, if the projectile itself is strong enough to penetrate the plate without breaking up, the maximite charge is not set off. Even tho the shell does break up on the plate, the maximite charge is only partially exploded, and with an explosion of a low order. It is loaded into shells by the simple process of melting and pouring.

In order to explode maximite, it is necessary that it should be strongly confined, as, for example, in a steel projectile, and that a very powerful detonator be used—that is to say, an exploding charge of some detonative compound like fulminate of mercury. More than a hundred grains of fulminate of mercury are required to explode maximite.

Maximite cannot be exploded merely by ignition. A barrel of it set on fire would simply burn like tar. Melted cast iron may be poured on it without exploding it.

Few people have any adequate conception of how terrific is the shock of a projectile upon armorplate. The long twelve-inch naval gun throws a projectile weighing half a ton, which has a muzzle energy of about 50,000 foot tons —that is to say, an energy equal to that developed by 50,000 tons falling one foot, or one ton falling from a hight of 50,000 feet.

As the weight of the projectile is half a ton, the shock upon the plate is the same as tho the projectile were to fall down upon it from a hight of twenty miles. This energy is equal to that which would be required to lift the battleship "Oregon" bodily to a hight of five feet.

Of course, the terrific energy developed by high explosives and the rapidity with which the action takes place are perfectly inconceivable to our senses. Still, the attempt to get some idea of them is interesting.

When a twelve-inch cannon, charged with smokeless gunpowder, is fired, the time that elapses between the flash of ignition and the instant the projectile leaves the muzzle of the gun is about the sixtieth of a second, a period so brief that to our senses it appears instantaneous. Sixty such cannon could be arranged

side by side and discharged by electricity, one after the other, within the time of a single tick of grandfather's clock.

The rate at which smokeless powder burns in a gun, under the high pressure, is about the sixteenth of an inch in the sixtieth of a second, or about four inches per second, and this we call slow burning in smokeless gunpowder parlance. The rate of combustion of high explosives, such as dynamite, is much higher, being about four miles a second. The pressure exerted by maximite, nitrogelatin, picric acid and other of the most powerful high explosives at the instant of detonation is estimated to be between 300,000 and 500,000 pounds to the square inch.

So violent is the action of maximite that a half ton armor-piercing steel projectile is broken into many thousands of fragments. At Sandy Hook one such projectile is estimated to have been broken into more than 10,000 small pieces.

Great as is this enormous pressure, and great as is the speed of the detonative wave, we have, in studying the structure of the earth, to consider forces which make these seem insignificant.

We frequently hear the theory advanced that planets and suns explode, and that our own earth might possibly explode from pent-up forces within. A high explosive exerts about the limit of pressure capable of being exerted by gases set free and expanded by the heat generated by any chemical reaction. Such a pressure, great as it is, is far too insignificant to explode the earth. Were the whole great molten interior of our globe to be replaced by dynamite and detonated, the explosion would not lift the earth's crust. We have but to calculate the weight of a column of granite of a hight equal to the thickness of the earth's crust, to see that the pressure of the crust on the molten interior far exceeds the pressure exerted by exploding dynamite.

We have seen that the speed of the detonative wave is about four miles per second. The speed of the earth in its orbit is four times as great. If, therefore, the interplanetary space of our solar system were to be filled with an explosive mixture capable of being detonated and consumed with the speed of dynamite, and if this were to be set off just behind the earth in its orbit, the earth would not feel it, but would rapidly rush away from the wave of explosion, pass clear around the sun, and come back again to meet it more than six months later. It would take nearly a year for such a detonative wave to reach our sun from the earth. If the earth itself were a ball of dynamite, it would require half an hour to explode; and if the sun were a mass of dynamite, it would require about two and a half days to explode.

MAXIMHURST LANDING, N. J.

The Call at Night

BY HENRY FLETCHER HARRIS

LEAVE the blind and naked dwelling
Of thy past,
Where the cowled and huddled shadows
Gather fast.

Let them, at their awesome pleasure,
Revel keep.
Forth into God's starry midnight,
Keen and deep.

To thine ancient self a stranger—
Better so!
Let the rushlight wink to darkness—
Rise and go!

OVIEDO, FLA.

The Crux of the Billboard Question

BY CLINTON ROGERS WOODRUFF

First Vice-President of the American Civic Association

TACOMA, Wash., has a vigorous local society known as the North End Improvement Society. It is "dead set" against billboards, and it has adopted a plan of campaign which is rapidly proving effective. In essence it involves the principle of the boycott.

The society has made a list of billboards in its district, and it writes to each advertiser that uses them asking him to abstain, as the boards are objectionable. If the first letter does not bring results, a second and stronger letter is sent, and this is followed up until something happens, the last step in the procedure being a rising vote at a public meeting, at which the members pledge themselves to abstain from purchasing articles that are advertised by billboards in its district.

Here are the results of the society's efforts to date:

The billboard people have stopped extending their available space and have curtailed their working force.

The tax against the boards in Tacoma has been doubled. Most of the old advertisers have ceased to advertise, and not very many new ones are appearing. Several large boards have been taken down. One immense billboard near the University of Puget Sound is down. This was a very large double-decker. Mount Tacoma, a beautiful mountain about three miles high, covered with snow and in plain sight from many parts of this city, was actually cut off from the view of the residents of the North End.

The society's correspondence with advertisers has been most illuminating and instructive, and the following letter and reply contain, in my judgment, the crux of the whole question:

"We have yours of the 21st ult., advising us that you do not approve of billboards in Tacoma, some of which contain our posters. We do not agree with you that our posters are ugly and unattractive, altho the putting up of posters generally does not tend to beautify a city. We do not know how we can help you at the present time, as we have let a contract with the bill posters to post your city for two or three months standing. After that has expired we may not place any more. But we think the best way to get at this would be for you to have a law passed in your city prohibiting billboards from disfiguring the city.

"It is natural for a manufacturer to advertise his wares in every possible way, and you could not expect us to have much concern for the beautifying of cities. That is, we might individually, but not as advertisers."

This is a very frank avowal of the attitude of the advertiser, who "is not in business for his health." The reply of the improvement society, however, is most effective. Here it is in full:

"If you will read our letter again carefully you will see that we did not say that your posters were 'ugly and unattractive,' but that the billboard system of advertising is.

"You state that you 'do not have much concern for beautifying cities. That is, we might individually,but not as advertisers.' The people whom you are trying to reach are 'individuals' and take pride in beautifying their city and 'have concern' in so doing. It appears to us that you as 'advertisers' must take note of this feeling of the people of a city in opposition to billboards that disfigure the city, because if a system of advertising is distasteful to people it is not a good system, is it? Your object is not to offend people, but to attract them, is it not?

"You, possibly, would not desire to have billboards placed near your own home. Other people feel the same way.

"How many goods would you buy of a traveling man who came into your office and presented his wares to you in an offensive manner? The manner of your advertising strikes other people the same way.

"If you will cease to have your posters placed here you will oblige and receive our thanks."

When advertisers appreciate this position fully and realize that 300 live, vigorous heads of families are ready to back it up by their personal co-operation, it will not be long before all the billboards in the North End district of Tacoma will remain unused.

A good suggestion comes from Buffalo, where the *Courier* proposes that the names of all persons who rent their vacant lots for billboard purposes should be published in the paper. This for two reasons—so that the tax assessors may take such rentals into consideration in assessing the property, and so that the people may know who are selling their civic pride and patriotism for cash.

Philadelphia, Pa.

Modern Music

BY FELIX WEINGARTNER

[Felix Weingartner, the eminent German conductor and composer, is also a feuilletonist of unusual ability. His literary style is as direct and incisive as his musical methods, and he wields the pen as effectively as the baton. In this discussion on "Modern Music," a plea is made for the restoration of "absolute" music to the rightful throne, from which it has been deposed by the illegitimate claims of "program" music. The personalities which Weingartner very courteously omits, may still be read between the lines, and the name of Richard Strauss might with propriety be substituted in more than one instance for the impersonal "one." Weingartner belongs to the original Wagner camp, but has long since taken a decided stand against the practice of "Young-Bayreuth." No conductor who has come to New York in recent years has produced a more favorable impression on the musical public.—EDITOR.]

THERE is an imperative need, at the present time, for a return of sane and healthy views in regard to symphonic music.

We are undoubtedly passing through a transition period, which is responsible for the bizarre and abnormal musical creations. This state of things has been brought about primarily by the significant development in the technical apparatus and resources of musical expression since the flowering period of the classical epoch, and it has also been influenced by the fact that the majority of modern composers do not know what to do with these tremendous resources.

As a consequence, we have the orchestral extravagances under which so many of the more recent modern compositions suffer, as well as the abuse of tone coloring, which so many of these compositions reveal.

It is possible to point out the same mistake in the other arts, particularly in that of painting as it exists at the present; at all events, it must be admitted that the modern symphonists go much too far in this direction.

The tone coloring should always remain in harmony with the content of the composition. There are undoubtedly musical ideas which demand an exuberant laying-on of color; it is just as certain that other ideas need to be treated with the greatest discretion.

Nowadays, this distinction is too little recognized, and the prevailing tendency among composers is to out-rival one another in color orgies in their musical creations. The natural result is often an absolute lack of proportion between form and content. A composer often has nothing to say, but he says it in trumpet and trombone tones.

The chief defect in our symphonic music, however, lies in the over-luxuriant growth of program music. Here we have reached a point that threatens ruin to the entire musical structure.

In a certain sense program music has always existed, even in the classical epoch, but it was always legitimate.

It is possible to take a given poem or certain events as a basic motive, and yet to treat the material in a purely musical manner. Take, for example, the "Oberon Overture" of Carl Maria von Weber; here one finds the motive of the poem suggested, but nevertheless the overture is in itself a complete musical work, built up on musical laws, and is perfectly intelligible and enjoyable to a listener who knows absolutely nothing of the text on which it rests.

It is quite different with the program music of the present time. Music has been robbed of its sovereign independence and placed at the service of other arts. I do not speak of dramatic music, whose existence rests solely upon its organic union with the spoken word and the dramatic action on the stage, but of symphonic music, to which a given "program" is attached, and which, by means of this tangible aid to imagination, endeavors to give expression to definite occurrences.

There is undoubtedly a certain connection between the various arts, even when each is kept strictly within its own proper limits. A painting can beget a musical mood; a musical work can suggest cer-

tain colors or certain poetical ideas to the minds of the listeners. But this only in quite a general and extremely variable manner. A certain musical work might suggest to one of two listeners a violet atmosphere, to the other a rose-colored one; one would be made to think of a tender love scene, the other of a poetic vision, and yet both would have a perfect understanding of the composition. A third listener would possibly rejoice in the mere tonal beauty and perfection of form, and also be in complete touch with the meaning of the music.

Nowadays, however, musicians are coming forward with the claim that, thru the medium of music, it is possible to give expression to the minutest details, just as in poetry and painting. The statement is frequently heard that music is a language just like any other. Here lies a fundamental error. It is, indeed, a language, but one which was not created for the sphere of the tangible, nor one that admits of any application to concrete matters; it is rather one that enters when the spoken word is no longer adequate, and which gives expression to deeper, higher, and more powerful emotions of mankind. If one forces music to illustrate slavishly the actions represented by another art, an art which is dependent upon quite concrete mediums of expression—one not only brings dishonor upon music, but causes an inner discord in the musical work. Under these conditions music is not permitted to follow its own laws, but is subserved to another art, and the musical form is disorganized. Liszt is always quoted as having said: "The content creates the form." If one admits this statement, it is only with the reservation that the content must also be musical. Too strict an adherence to the basic poem not only destroys the form and does violence to the original character and formal laws of music, but the ultimate goal is passed, as music subjected to this treatment can never create the desired definite images.

The most varying pictures and fancies will float before the listener. The arousing of these definite ideas will be much more readily possible to the masters, who allow the music to speak only thru its own form and resources. Beethoven's "Pastoral Symphony," for example, never fails to conjure up idyllic images for every listener.

The rise of this evil tendency of program music may be easily accounted for on psychological grounds. When the great epoch at the close of the eighteenth century was over, there was a noticeable falling off in the symphonic production. Even the most eminent masters felt that they were neither able to excel, or even equal, the achievements of Haydn, Mozart and Beethoven. They were therefore forced, at any cost, to think of something new, something different, and in their dilemma they seized upon program music.

FELIX WEINGARTNER.

To consider Berlioz, as is always done, the father of this movement, is quite a mistake. Berlioz was not a writer of program music in a faulty sense, and it is to be devoutly wished that modern symphonists could arrive at Berlioz's viewpoint, when the formal elements of the symphony would be assured of recognition and reverent treatment.

Similar reforms would also not be amiss in the field of operatic music. Here, as in symphonic music, the enormous increase of resources has worked dire disaster. As all of the newly acquired resources are instrumental, the result has been a powerful augmentation of the orchestral apparatus, while on the stage there is only what there always was—the *human voice,* and this is often completely smothered by the extravagant orchestration.

Again, unhealthy and abnormal conditions, denoting a transition period. Just as program music is to be traced back to Liszt, so is this exaggerated operatic orchestra to be attributed to Wagner. Most of the faults in the modern opera have arisen from the imitation of the misunderstood Wagner. Composers have not been able to distinguish between the essence of his reforms and their secondary quality; to separate the objective and the legitimate from the artistic personality of Wagner.

The impulse which Wagner gave to the modern opera consists chiefly in the change he made from a collection of dialogs and vocal numbers to a music-drama. His artistic individuality demanded the most powerful materials, and it was solely from this cause that he was also forced to call into existence a powerful instrumental apparatus.

He who fought the world of gods and goddesses down to earth was obliged to have at his service the most powerful means of expression. Wagner's successors make the mistake of applying this art of instrumentation to any and every subject, and believe themselves to be intensely modern if they only imitate the Wagnerian motives and harmonies.

The only composer who really understood Wagner and caught his true creative spirit was Verdi. "Falstaff" I consider the only operatic masterpiece which has been written since the Wagnerian revolution.

Anti-Wagnerians are fond of accusing him of wishing to banish melody from the opera. One is able to point to any number of separate musical numbers in his works. Even in the very last one, "Parsifal," the monolog of Amfortas is really an intact number. In fact, in the earlier operas the several parts were numbered and characterized as solo, aria, duet, etc., quite as in the big French operas.

If there is to be a wholesome reaction in operatic style this aping of Wagner (which rests chiefly upon a misunderstanding of his motives) must be abandoned, and only his healthy reformatory principles be followed.

A word about the modern concert life. That which painfully affects the intelligent musician is the *Stillosigkeit* of the programs and the featuring of soloists, which has become a veritable nuisance. There is too much catering to the audience in performing in one evening works of the most varying schools and styles, so that an absolutely inartistic contrast is the result. A program should be devoted to the works of one composer or to those which are related in style.

This evil is increased by the concessions which the conductors make to the soloists. One can think of nothing more tasteless than to follow a powerful orchestral number by a little song with piano accompaniment, the only reason it is done being to give an opportunity to the popular prima donna, with her engaging smile and sensational toilet. The soloists choose what they please and what is best suited to them, unmindful of the fact that the artistic harmony of the program is being utterly destroyed. There is only one solution to this problem—the program should not be chosen for the soloists, but the soloists for the program.

BERLIN, GERMANY.

Threatening Situation in China

BY THE REV. CHARLES BONE

[The writer has been a missionary in South China some thirty years; speaks the language like a native; and is intimate with life in the interior· is very well known in South China. This article is timely as to the unrest in Kwangtung and Fukien Provinces near by, and we can scarcely have a better body of thought on the situation in China to-day.—EDITOR.]

THE contemporary situation in China is one that must evoke an interest in the breasts of all thoughtful men, who sympathize with the struggles of nations in quest of greater freedom. It must also create considerable anxiety in the breasts of those who have a close relationship with the Middle Kingdom, whether commercial or political. Indeed ultimately it is the commercial interest that predominates; for were it not for the substantial and ever-increasing volume of trade which Great Britain, Germany and the United States have with China, the political interest could not possibly assume the importance that today it assumes. It is because the ships of these nations are constantly entering and leaving the treaty ports, and the emporiums created on the coast of China, that the flags of these nations float over their respective consulates, in all the treaty ports, and their Governments are represented by efficient plenipotentiaries at Pekin. Such being the case therefore a review of recent events in China will not be without interest to the reader; and a forecast of the future, tho, perhaps, somewhat dangerous, may be pardoned.

The recent uprisings in the great commercial Province of Kwangtung, in the South of China, tho they were apparently unorganized, or imperfectly so, were fierce enough to destroy missionary buildings, educational establishments and official yamens, without distinction, and were determined enough to lay some of the local officials prone in death. These, however, are but the outward and visible sign of an inward and aggravated irritation which many believe has a lodgment in a large number of breasts of the citizens of China, and especially in the hearts of those whose minds have been freed from the cast-iron bondage of the mummifying intellectual process, which, in the past, has usurped the place of a sensible and sound education.

When the *real* founders of the present dynasty sat on the Dragon throne, tho to the Chinese they were alien and barbarian, the glamor of their wide conquests, conspicuous ability of two of their Emperors, and the marked sympathy of these rulers with the intellectual ambitions of the Chinese people damped for a time the hidden fires of hatred that naturally filled the hearts of those who had been conquered, and compelled to wear the hateful queue as a sign of servitude. Never, however, have the more patriotic Chinese really acquiesced in the victories that the fierce Northern Manchus won over the conflicting factions into which China was divided when the Mings fell, and never have the more thoughtful of the people, for a moment, forgotten that the victories of their enemies proclaimed to the surrounding nations in the East of Asia, that China's flag had trailed in the mire, and her honor had been humbled in the dust. The reigns of these two august Emperors, with one short space between them, of little importance, covered the period of one hundred and thirty-four years. It may be repeated that during this period—a period of literary glory, and national political aggrandizement—the hatred that naturally lurked in the breasts of all intelligent Chinese was softened and toned by expansion of their Empire, and the good sense of their rulers. It still existed however. One-half of the fascination, which the historical drama always throws over the minds of the crowds of Chinese, that congregate to witness them, is owing to the fact that the actors generally wear the robes and headdress of the dethroned Mings. This hatred of the present dynasty has always existed, but it is only

comparatively recently that the banked fires have blazed forth, with a fierceness that is manifest to all observers.

In marked contrast to the conspicuous ability of the two Emperors referred to have been the ineptitude and failures of their successors. In China, as everywhere else, nothing succeeds like success. The achievements of the rulers, to which reference has been made, only renders by contrast the more contemptible the chain of failures that has linked together the years that have followed. It is true, that recent Emperors have been confronted with a new set of circumstances, but nobody cares for that; no one will condone their failures because their environments were less happy. It was unfortunate for the Manchus that they assumed the nomenclature that was current in China, and cheerfullv announced that as rulers they would still be "Sons of Heaven," the "Fathers of the black-haired race," and "the Shepherds of the sons of Han." They had boldly claimed these high-sounding titles; therefore the least that could be expected was that they should prove their claim by discharging their duties and by protecting the people. In this they have conspicuously failed. The history of China, and of the relationships of China's rulers and Viceroys with foreign nations have, during the last half century, been even more humiliating to the Chinese than the conquest of China itself by the barbarians from the North. Panoplied in a pride that was ridiculous, and brazened by an effrontery that was contemptible, they have repeatedly fallen upon their faces before a handful of white warriors, and the crash has been all the louder, and the humiliation the more scorn-producing, because of the pride and effrontery with which, at first, they blustered at and confronted the nations of the West. The history of China, during the last sixty years, is a history of shame for her rulers. By Great Britain, by France, by Japan, by Russia, by Germany in turn, and then by a few men from each, called the Allies, aided by a contingent of Americans, China has been compelled to bow the knee, lick the dust, and sue for peace and mercy. The result of all this is, not that the *Chinese* have been conquered, and humiliated, but that the *Manchus* have submitted to this ignominy. The "fathers" and "shepherds" of the people, whose sole right to reign according to Mencius, is that they may protect the people, have fled at the approach of a despised enemy, and, in order to save their seats, have submitted to unbearable shame. Therefore it has come to pass that, not only is there an innate hatred of the ruling race, but, in addition, that hatred is mixed with scorn: they have proved themselves to be but boastful children before the world.

There has further come into play another feeling which has rendered the feelings more complex. The innovations of the West were at first despised by the Emperors and Viceroys of China. They would have none of these things. The Chinese themselves are emphatically a utilitarian people, and the history of the last ten years proves clearly enough that they are willing to adopt and adapt what commends itself to their intelligence and will conduce to their comfort. The *judgment* therefore of the Manchus was of no higher order than their bravery in battle, their strategy in war, and their foresight in diplomacy. They have made the tremendous mistake of misreading the signs of the times, and have despised agencies and inventions which, if adopted earlier, might have saved them from some of the more severe humiliations. Indeed, more than that, the people see clearly enough that even now the officials do not accept innovations *con amore* but simply because they cannot help themselves; their choice is Hobson's and not their own. The recent *coup d'état* at Pekin, really the result of an attempt of some far-seeing advisors of the Emperor to introduce what the logic of facts has later compelled to be done, was but a visible manifestation of the Manchu attitude toward all progress.

Enough has been said to prove that, if there exists in the hearts of the Chinese people a hatred for the reigning dynasty, facts will amply explain and even justify this attitude. There is, however, another set of conditions that is pressing upon the shoulders of the people, as a yoke presses upon the neck of an overladen ox, whose skin is worn bare thru excessive toil. China today is compelled to do one thing, and, in a blundering way, tho late in the day, is attempting

another. To do either effectively, money is needed, and money is at present very difficult to wring out of the pockets of the people. Indemnities must be regularly paid to those nations whose representatives were bombarded in Pekin in 1900. Sundry innovations and improvements are being attempted thruout the Empire, and, in order to carry them out successfully, money is needed. There is no doubt that, at present, the people are groaning under a taxation intolerable to be borne, and yet we see frequent notices that more funds are needed to successfully carry on the Government. When the recent edict dealing with the gradual suppression of opium in China was promulgated thruout the two Kwang Provinces, the Viceroy, and his advisors, announced that the agreement come to with Great Britain was good in itself; but, as far as the two Southern provinces were concerned, the hour was most inopportune and therefore the Viceroy asked the throne for an extension of time, which probably meant that the edict would be pigeon-holed, or burked. The provincial rulers needed the opium revenue in order to carry on the local government, and establish elementary improvements among the police. This attitude is characteristic of what may be assumed to exist all over China. The people are taxed up to the breaking point. The reports in the native papers, which describe the two recent outbreaks in the Kwangtung Province, toned down as they were by fear, lest the ungloved hand of the irate officials should hale the editors to cells in the provincial prison, proved clearly enough that the exactions of the mandarins, and the imposition of additional taxes on the sugar industries, roused the dumb anger of the people to a boiling point, when, like an eruption from an active volcano, nothing could suppress it till it had spent itself.

Such we conceive to be the situation in China today, and it does not require a special degree of prescience, nor, indeed, much special knowledge of China in particular, nor of history in general, to foresee that the outlook may be both serious and perilous. The banners of the angry mob that killed the mandarins and destroyed their yamens a few weeks ago at Wong Kung were besmeared with the blood of those who had been butchered. In addition to this the character "Suen" and "Hing" were inscribed upon these banners. The former represented the famous revolutionary leader Suen Yat-san, and the latter the family name of the still more noted leader of the great Tai Ping Rebellion. Suen Yat-san and Hing Yau Wei, the reformer, who escaped from Pekin, when many of his co-workers sacrificed their lives in the year 1898, are yet alive and still at work, tho no one seems to know the spot where they are hidden, except those who are in sympathy with their ideals. Modern weapons are known to be surreptitiously imported into China, in large quantities; for only today I have read in the local native press an edict announcing that it is suspected that no less than thirty thousand Mauser rifles are on their way to China. It will be seen, therefore, that all the elements of a rebellion on an enormous scale exist. It is almost impossible to believe that contemporary discontent with the Manchu rulers will either wane or be pacified. This discontent is becoming more acute in character, and widespread in volume, because of the large numbers of Chinese students who have learnt something of the lives of outside nations, and are the more humiliated, by the conditions of existence in their own unhappy land. The history of nations proves that submission to continued oppression cannot hold out forever; and the more recent history of events in Cuba and the Philippines shows what usually happens when the power of submission is worn out, and the passion of the hour throws all prudence to the winds. It is the general opinion, that, were leaders forthcoming, and any considerable section of the army to become discontented, and rise in mutiny, revolt would cover China, as fire runs thru and covers a field of dry stubble. In that case the destruction and carnage would equal if not surpass what happened during the Tai Ping Rebellion, when, according to the estimation of Dr. Wells Williams, 20,000,000 perished, and whole districts were devastated, which even up to this time have not yet recovered.

HONG KONG, CHINA.

Literature

Alice-for-Short

It is generally conceded that "Joseph Vance" was one of the best stories published last year, and Mr. de Morgan's new novel* is an equally admirable piece of work.

"In January, in which this story begins, there was a dense fog in London, and a hard frost. And there was also a little girl of six in a street in Soho, where the fog was as thick and the frost as hard as anywhere else in the metropolis. The little girl was bringing home the beer from the Duke of Clarence's Head at the corner to an old house that had been built in the days of her great-great-grandfathers."

This is your introduction to Alice-for-Short. And you can tell from it that the author will tell his tale in a leisurely manner, else he had left out the little maid altogether and begun with the young lady. Also, if you are sufficiently well versed in the art of fiction makers, you will understand that a story which begins at the Soho end of things, with so young a heroine, who lives in the basement with a mother to whom one brings beer, will conclude, say in Harley street, with great splendor and sufficient pomp of circumstance. You will suspect from the first that the old jug contained a wonderful ring that had been pawned by the mother who drinks beer. It is a curious thing about all such maternal characters in fiction that they pawn the very article of jewelry upon which the fate of the heroine and climax of the story depends. And you will, of course, suspect that there are the bones of a lady as light as she was fair buried in the cellar. Neither will you be surprised that Alice-for-Short saw ghosts upon the stairs, or that the old house, the blackened pictures and the quaint ornaments all really belong to the little girl whom you just met carrying beer from the Duke of Clarence's Head. That is, you will not be surprised if you are familiar with the way Dickens and Thackeray wrote of such things. "I am curious," an enthusiastic literary critic writes to us, "to see whether it will set an example and start a reaction from the modern snapshot novel in favor of the old intimate Dickens and Thackeray style." That is extremely uncertain, partly because we have lost the patience and leisure to enjoy such romances, and partly because a nation may lose its literary inheritance as easily as a man loses his patrimony in speculation.

De Morgan's novel is a happy reversion to the old type. An outline of the story would convey little idea of its charm, altho it is a rare compendium of all the spells and mysteries ever employed to fascinate readers of romance. But here is where he begins to differ from the ordinary writer of fiction. He tells so naively and with shining eyes of ghosts and wonders and of strange fierce loves, as if it were the most natural thing in the world for such things to be. He has entirely escaped the sensational manner of narration which is the literary popgun so often employed now by popular novelists.

Another thing which charms is the fact that while the author's manner is in no sense an imitation of either Dickens or Thackeray, his book contains a sort of sweetheart likeness to the old-tale spinning spirit which entertains children, and it is enhanced by a dash of Barrie's tenderness. The fashion now is for an author to divorce himself so thoroly from his characters as to be able to say the sharpest, most vindictive things about them, and thus to prejudice the reader accordingly, but we all remember how Barrie made his "Grizel" adorable a few years ago by encompassing her about with the lovingness of his own fancy. So de Morgan is Alice's godfather. And this attitude of blood tenderness toward her goes far toward strengthening the reader's impression of her charm and reality.

Add to this Mr. de Morgan's inimitable representation of the illogical, inconsequent workings of the ordinary human mind (which in the average novel is kept fixed like a needle to the pole with reference to the desired conclusion), and you

*Alice-for-Short. *By William de Morgan.* New York: Henry Holt & Co. $1.50.

have discovered a part of the secret of the charm with which this story is written, but by no means the greater part. There is a whimsical humor in it that is said to resemble Dickens, but it is really of a finer quality than Dickens's obvious caricatures and exaggerations of all mortal eccentricities. Rather, it is a gentle effulgence, like a friendly candle held up to show forgiveness, and to reveal the place for a smile even in the very darkness of human affairs.

Experimental Evolution

ALL those interested in the study of evolution must certainly be grateful to Mr. Tower, of the University of Chicago, for his magnificent experimental work, some of the details of which he has just published.[1] Not only does it greatly extend our knowledge of evolution along the old lines of research, but now for the first time do we have clear cases of the modification of the germ plasm by external conditions. Former investigators have shown that an abnormal environment may have a determining effect upon the development of organisms, bringing about apparently new characters, but these new characters were not inherited; and here was the stumbling block of all theories of evolution which postulated a modifying influence of changed conditions of life. Furthermore, altho evolutionists have *seen* new forms arise which transmitted their peculiarities to their descendants, they have not, heretofore, been able to *make* them arise at will. An outline of a single experiment shows the nature of this part of the investigation. Four males and four females of the common potato beetle were subjected to hot, dry conditions during the formation and fertilization of the first three lots of eggs and were then returned to a normal environment, where two more lots of eggs were laid. The young from each of these five lots were reared under similar and natural conditions. From the last two lots 61 beetles were obtained, and they were all normal; but of the 96 reared from the first three lots, 82 were of a very different type (*pallida*) and 2 of still another type (*immaculothorax*). These not only bred true without reversion to the common potato beetle, but *pallida* competed so well with the old type when turned loose in a field that, after several years, Mr. Tower felt that it was not safe to allow it to go any longer, and so killed it off. This and others which the author describes seem to be clear cases of the experimental origin of species.

The Mendelian law of heredity, which is engaging the attention of practical as well as experimental breeders of both plants and animals, may, in its simplest form, be stated as follows: If two varieties having contrasting characters, such as short fur and "angora," be crossed, the resulting hybrids will not be intermediate, but will show only one of these characters. This is said to be "dominant"; the other, "recessive." If, now, these hybrids be mated *inter se*, the recessive character will reappear perfectly pure in one-fourth of the offspring, one-fourth will be pure dominant, and one-half will be hybrids like their parents, altho often indistinguishable from the pure dominants except by breeding. Castle has been testing this law by the use of guinea-pigs and rabbits. The results of his experiments are given in the first paper from the recently established Carnegie Station for Experimental Evolution.[2] He finds that the coat characters conform well to simple Mendelism. The lop-eared condition in rabbits does not. The work is of popular interest not only on account of its bearing on inheritance in general, but also because of the special information it gives to the increasingly large number of people who are breeding the fancy varieties of these pets. Albinism is found to be recessive to pigmented coats. Smooth coat is recessive to rough, and long coat to short. Given, for example, a short-haired albino and a pigmented angora, we can get in the second generation albinic angoras which will breed perfectly pure by crossing these two and breeding from the offspring. The first generation will, however, be common-looking colored animals

[1] AN INVESTIGATION OF EVOLUTION IN THE CHRYSOMELID BEETLES OF THE GENUS LEPTINOTARSA. *By Wm. L. Tower.* Carnegie Institution of Washington, Publication No. 48; Papers of the Station for Experimental Evolution at Cold Spring Harbor, N. Y., No. 4. 1906. 320 pp., 30 plates.

[2] HEREDITY OF COAT CHARACTERS IN GUINEA PIGS AND RABBITS. *By W. E. Castle.* Carnegie Institution of Washington, Publication No. 23; Papers of Station for Experimental Evolution at Cold Spring Harbor, New York, No. 1. 1905. 78 pp., 6 plates.

with short hair. The paper is of very great interest to the biologist because of the author's acute analysis of the exceptions to the simple form of the "law." The most novel of these is the "latency" of pigment characters in albinos.

Lodging Houses

It appears that Boston, next to San Francisco, has the largest proportionate lodging-house population in the United States. Albert B. Wolfe, Ph. D., a Harvard Fellow of South End House for two years (1902-4) and now associate professor of economics and sociology at Oberlin College, undertook during the time of his occupancy of the fellowship a study of *The Lodging-House Problem in Boston*,* and the result of the study is published as Volume II of the "Harvard Economic Studies." The history of the movement which has transformed the boarding-house population into a lodging-house population, the change in the section of the city from one of residents in private homes to one of lodgers of houses kept by landladies, the general characteristics of the landlady and her lodgers are all interestingly presented. So, too, the maps and charts, illustrating these changes and evolutions, the fluctuations of the real estate, the economic status of the lodgers, and the dominance of the lodging-house population in the South End of Boston are helpful aids and guides. The author, however, is disappointing in not being more convincing and conclusive in some of the salient points he has raised; he has left vital issues related to the subject for others to investigate and develop. The inadequacy of his chapter on "Crime and Prostitution" is particularly noticeable. The chief reason why the lodging-houses are so frequented by the criminal class is that they can most easily evade the police by frequent change of address. It seems that the landlady, pushed by the owner of the lodging-house to eke out her income, becomes less and less scrupulous as to the character of her "roomers" in order to be sure that she has her rooms taken at the highest possible rental. The café or small eating-house is an adjunct to the lodging-house, and has been an element in transforming the boarding-house into a lodging-house.

"Could we have a few . . . large, liberally managed eating-halls, and at the same time could the present system of lodging-houses be reformed by the introduction of public parlors, better sanitary resources, and enlightened moral opinion on the part of both landladies and lodgers, there would be no necessity for wishing to do away with the lodging-house. . . ."

The author suggests the change of the building laws so as to permit the remodeling of the present lodging-houses in Boston to have two single rooms where there is now one.

"It would thus be possible, at relatively low cost it seems, to have in the same building eighteen single rooms, two baths and a public parlor, where now there are eight double rooms, five single rooms, only one bath and no public parlor."

Working women's and workingmen's hotels, model lodging-houses and model boarding-houses—for those who prefer that type—are not too much to hope for, thinks the author, but they should be on a business, not a philanthropic, basis.

Many of the so-called problems of the lodging-house population are really the problems which affect society at large—they involve the economic and social position of the young man who postpones marriage because of inadequate wages and that of the insufficiently paid young woman who is placed in the way of temptation thru the failure of society to safeguard her. We need "a juster sense of economic proportion and social expediency," and, even tho such studies as this are mere drops in the great bucket of social palliatives, they help.

Making a Newspaper. By John L. Given. New York: Henry Holt & Co. $1.50.

The never-failing romance of the newspaper shop is revealed anew in Mr. John L. Given's handbook. Shop and romance are words both used advisedly; for, while from some viewpoints newspaper making is sordid and dirty, yet, on the other hand, it is the world-process in little, and deeds of high emprise make it the very knight errantry of business. As the working system of a great daily unfolds itself in Mr. Given's graphic narrative, one shares

*The Lodging House Problem in Boston. *By Albert B. Wolfe.* Boston: Houghton, Mifflin & Co. $1.50.

the newspaper worker's throbbing sense of the multiplex city cosmos. The eyes and ears and tactile senses of the town are myriad—policemen, parsons, cits and placeholders, society butterflies and servants, physicians, undertakers, paid watchers and volunteer tipsters, the telephone, the telegraph and the messenger—all of whom and which feed the nerve-racked central consciousness in Park Row or Herald Square. At the center of things life boils and bubbles like a Niagara whirlpool. There is no such word as fail to these frenzied genii of the Press. Work so demoniacally they certainly cannot for the mere paltry salaries. Neither are they martyrs to country or principle, like the self-immolating Japanese. Discipline, loyalty, emulation, the passion for results, have helped to make the American newspaper reporter the marvelously efficient machine that he is. Mr. Given admits a great deal of truth in the saying that good reporters, like poets, are born to the craft. Ability to see the vital and picturesque must be supplemented by ability to collect the information and ability to write, and all three must be backed by unbounded enthusiasm and superb good health. Mr. Given discourses agreeably of the various departments of the newspaper man's calling. The tremendous daily effort would be wasted save for a perfect and specialized organization arranged in a hierarchy of capacities and values from Big Chief to proof-boy. The writer adopts the insider's view that the remarkable thing about the newspapers is their freedom from error and their general uprightness rather than their numerous sins of commission and omission. This is undoubtedly the true view to take. Writing a description and not a critique, Mr. Given does just as well not to expatiate on the ugly details of the yellow journalism, but instead to draw a consistent picture of the more average newspaper making. The book will occupy a place on the literary journalist's shelf beside Mr. E. L. Shuman's "Practical Journalism," and, while it will not wholly supersede the Chicagoan's brisk and lively compendium, it possesses the peculiar merit of giving the most comprehensive and thorogoing account of New York newspaper making that has so far found its way into print.

Lord Milner's Work in South Africa. From Its Commencement in 1897 to the Peace of Vereeniging in 1902. By W. Basil Worsfold. New York: E. P. Dutton & Co. $4.50.

With the Transvaal now among British colonies possessing representative government; with the first Parliament in session; and with General Botha as Premier, there is a revival of interest in the circumstances under which the two republics disappeared and Great Britain became possessed of the Orange Free State and the Transvaal. How it all came about is told with much detail in Mr. Worsfold's study of Lord Milner's work in South Africa. Mr. Worsfold is frankly a partisan, and a thick-and-thin partisan, of Lord Milner; and is unsparing in his condemnation of the Liberal leaders who showed any sympathy with the Boer republics, either when negotiations were proceeding or after the war had begun. But he writes with all the official correspondence before him, including the documents belonging to the Boer governments which fell into the possession of the British at Bloemfontein and later at Roos Senekal, when Gen. Bindon Blood, during the guerrilla warfare, captured the Boer laager. With this documentary evidence of the real aims of the Boers it is easily possible to throw new light on the attitude that Kruger took up toward Lord Milner at the abortive Bloemfontein conference in May, 1899, and the reasons which were behind his refusal to make concessions to the British Government. If this evidence is to be relied on, the Boers in the Transvaal and the Free State, and many of the leaders of the Dutch in Cape Colony, were convinced that if war were begun and they could hold out long enough, they could bear down the opposition of the British military forces and make the Dutch supreme all over South Africa. It is this evidence, together with Mr. Worsfold's tracing of the conditions in Cape Colony up to the outbreak of the war and during the war, that makes his book of value as a contribution to the literature of the downfall of the two South African republics—of value even to readers who may tire of his special pleading and his unchanging admiration of Lord Milner. It is within the province of any author to determine within what limits he will con-

fine his work; but it is to be regretted that Mr. Worsfold did not follow the career of Lord Milner to the promulgation of the Chinese ordinance of 1904. Most of the pressing difficulties which now confront General Botha as Premier of the Transvaal arise out of Lord Milner's surrender to the mine owners; and some defense of the ex-High Commissioner's action on this question is naturally looked for in a book so charged with praise and admiration.

Local and Central Government. A Comparative Study of England, France, Prussia and the United States. By Percy Ashley. New York: E. P. Dutton & Co. Pp. xi, 396. $3.00.

It is an impossible task to cover with anything like completeness or detail in the space of 400 pages the immense field that Mr. Ashley has laid out, and it speaks highly for Mr. Ashley as a lecturer that he has produced so readable a volume out of material which in less able hands would have sufficed only for a dry compendium or a useful text-book. In this latter capacity—as a handbook for ready reference—Mr. Ashley's book should find a place on the shelves of every working library of municipal politics and political science; but before being relegated to this place of humble usefulness, *Local and Central Government* is well worth an attentive and careful reading. Mr. Ashley writes from the point of view of an Englishman; and English municipal government is the standard of comparison for the municipal economy of France, Prussia and the United States. While ready to acknowledge the points of excellence in French and Prussian local government, Mr. Ashley is essentially English in his admiration of the well-balanced position that the English municipalities hold between the unrestrained liberty of American cities and the subordinated activity of French and Prussian municipal government. Over the American cities no strong State executive departments exercise any administrative control; while the responsibility of the local executive in France and Prussia is entirely to the central government, and scarcely at all to the taxpayers, electors and inhabitants of the areas over which they preside. In the order of their subordination to the central government, Mr. Ashley puts first Prussia, then France, England and the United States. Prussia he considers exceedingly weak in the power of self-government and in any local interest in the problems which are all settled by the central administration. For the liberty —almost anarchy—of American municipal government Mr. Ashley has little admiration. Neither does he admire the expedient which has been adopted, in the form of constant legislative interference with city government, to compensate for the lack of any central administrative control. Yet he does not take the pessimistic and harshly critical attitude toward American municipal government which is adopted by many English writers. He writes:

> "Though the machinery of city government in the United States strikes an English observer as often unnecessarily cumbrous, yet the actual difficulties of working are neither so frequent nor so great as might be supposed. And the stories of corruption and inefficient administration should not be allowed to obscure the fact that the American municipal administrators are doing much very valuable and, in some respects, pioneer work."

The Censorship of the Church of Rome, and Its Influence Upon the Production and Distribution of Literature. By George Haven Putnam. Vol. II. New York: G. P. Putnam's Sons. $2.50.

The second volume of Dr. Putnam's "History of the Index," which covers the period from 1600 to 1900, maintains the high standard of scientific scholarship which characterized the preceding volume. The work, as now completed, ranks second only to Reusch as a history of prohibitive book legislation, and is easily the best authority on the subject in the English language. Turning to Dr. Putnam's summing up of the results of the Index, we find him so fair and cautious, so scrupulous in his purpose to do full justice to both sides, that no candid student, whether Catholic or non-Catholic, can feel anything but gratitude and respect for him. He quotes at great length apologists for the Index, like Hilgers, and then gives the objections to that institution, which have been made chiefly by liberal Catholics, and leaves the judgment on the case to his readers. If we were to pass any criticisms upon

this latter portion of Dr. Putnam's work it would be that he makes too little of the momentous activity of the Index under Pius X. A domestic conflict of truly vast proportions is imminent within the Roman Catholic Church; and it is already evident that the Index is going to be the Papacy's deadliest bludgeon in its attack upon liberal Catholicism. A new era, perhaps the ghastliest of all, is opening for the Index; and we would wish that Dr. Putnam had perceived it.

Literary Notes

....Teachers who have been instructed and uplifted by the books of Patterson Du Bois on "The Point of Contact in Teaching," "Beckonings from Little Hands," etc., will find the same qualities of pedagogical discernment and abounding common sense in a slight treatise on *The Culture of Justice*, in which parents as well as pedagogs will find much sound wisdom on important topics of perennial interest. (Dodd, Mead & Co. 75 cents.)

....*Beatrix of Clare*, by John Reed Scott (Lippincott, $1.50), is a charming love story. The scenes are laid at the Court of Richard III, the heroine is a pretty lady in waiting to the Queen, and the hero is a "brave true knight." Otherwise the book abounds in royal gossip, and we know what that is, the worst and most interesting scandal the world has ever known, of murder, intrigue, crime, treachery of every sort out of which history is made—all dramatized in this tale till it is the very essence of the daily life of the characters which move through its pages.

....We note a new edition of *The House of Quiet*, by A. C. Benson (E. P. Dutton & Co., $1.50), and its old charm does not fail to enchain us. We regret a misprint or two, notably "illusian" for allusion on page 130, which should not occur in a reprint. Otherwise it is an attractive edition of a book which proclaims itself, in the author's preface, to be "a message to the weak rather than a challenge to the strong," yet, we fancy the strong man, also, may find a message he needs in its pages. *The Thread of Gold*, a similar volume of reflections and observations, appears now under Mr. Benson's name.

....The latest volume of Lloyd Mifflin's poetry, *My Lady of Dreams* (Oxford Univ. Press. 75 cents), is not one of the best specimens of his work. To be sure, it contains some good matters—what verse of Mr. Mifflin's does not? But it is rather too brainspun. It is marked too conspicuously by that fondness for technology, that disposition to make much of poetics which is characteristic of his sonnets and more or less inevitable in so complicated a poetic form, but which, introduced into the simpler forms of lyric verse, give them a rather unhappy air of contrivance and insincerity.

Pebbles

THE IDEA.

SUBWAY GUARD—A little lively, lady!
Elderly Female—I am *not!—Puck.*

WHY, Frankie, what are you reading in that book about bringing up children?"

"I'm just looking to see whether I'm being properly brought up."—*Literary Digest.*

GRANDFATHER (enthusiastically)—Say, Willie, don't you want to go thru a toy shop with me this afternoon and see all the pretty things?

Willie (indifferently)—I'm willing to, pop, if you will get any pleasure out of it.—*Life.*

"I DID intend to go downtown to look at some stockings today," remarked Mrs. Schoppen, "but it was raining, so I just stayed at home."

"Why," remarked her husband absentmindedly, "that's the best time to see them."—*Philadelphia Press.*

AND THEY WONDERED.

AT a banquet held in a room, the walls of which were adorned with many beautiful paintings, a well known college president was called upon to respond to a toast. In the course of his remarks, wishing to pay a compliment to the ladies present, and designating the paintings with one of his characteristic gestures, he said: "What need is there of these painted beauties when we have so many with us at this table?"—*Ladies' Home Journal.*

GRIEF TURNED IT WHITE.

DOUBTFUL LOOKING INDIVIDUAL AT DOOR—That lost dog you are advertising for, mum, I have brought it back.

Lady—But that's not my dog; my dog was black.

Doubtful Individual—The werry same dog, mum; but you see his hair has turned white with grief at being separated from you.

The lady is satisfied and hands him ten shillings reward.—*Tit-Bits.*

SLIGHT MISUNDERSTANDING.

A WELL-KNOWN Boston lawyer says that not long ago he was astonished to see printed in a newspaper a glowing testimonial as to the benefits to be derived from using somebody's Curequick. The office of the concern was located near his own, and he dropped in while out for his lunch.

"See here," he remarked, somewhat forcefully, when in the presence of the manager, "you have printed a testimonial allegedly from me with regard to your confounded stuff—and I never took a drop of it in my life. What do you mean by such procedure?"

"Is that so?" the manager said, soothingly. "Merely a slight misunderstanding, I assure you, sir, for which I am very sorry. You see, we understood that you had died recently. Take this down, please," he added, turning to a stenographer: "Memorandum: change signature to sworn testimonial No. 124,546."—*Harper's Weekly.*

Limiting Opportunity

If it were true that prosecution for unlawful favoritism in freight rates is "persecution" of railroads and a "thoughtless attack upon industries," the remarks of Mr. Rockefeller in his latest statement to the public would be reasonable and edifying. While he may have exaggerated the hardships of his lot by picturing himself as "harnessed to a cart in which the people ride," it will not be denied that those who control great industries are burdened with responsibility concerning the men whom they employ and those other persons who have invested in their undertakings. It will also be admitted that general prosperity is desired by the heads of industrial corporations.

But neither the employees nor the "frugal people who have invested small savings" in the securities of such corporations ask the managers of them to violate the laws. Unless our estimate of the American people is an incorrect one, a very large majority of each class—the employees and the investors of small savings—would emphatically express disapproval of law-breaking by the corporations in which they might thus be interested, especially if the law violated were one designed to enforce fair play and to prevent the oppression and ruin of innocent competitors by unjust and wicked practices.

Mr. Rockefeller speaks of the "opportunities" which his investments of capital have "opened" for thousands. A majority of our people are more inclined to think of the opportunities which, as they believe, his great corporation has closed after they had been opened for themselves by men courageously and intelligently striving to better their condition by independent industry. In his defence of the Chicago packers, or Beef Trust, when the President and Congress were seeking by wise legislation to end their objectionable practices, Mr. Rockefeller deplored any such "limit" of "opportunity" because it would discourage enterprising young men and "put the brakes on our national development." Unless the many volumes of testimony taken by Congressional committees and other legislative investigators, with the records of some of our courts, are full of falsehoods, Mr. Rockefeller's great company was busily engaged for years in "limiting opportunity" for comparatively weak competitors in the oil refining industry and was quite vigorously discouraging every young man who endeavored honestly to build up a business of his own in that field of effort.

There was George Rice, for example He was not an old man when he first became an object of the great company's solicitude. For many years he sturdily resisted its attempts to limit and to close completely his opportunities. The method used in one instance has frequently been cited, not because it had not been used in other places and for the discipline of other refiners, but for the reason that the facts became a part of the official record of a Federal court. Rice and the great company's competing local refinery obtained crude oil from the same source of supply. The connecting railroad was in the hands of a receiver. With this receiver the company's agents made a compact, in accordance with the terms of which the company was to pay a freight rate of 10 cents a barrel, Rice was to pay 35 cents a barrel for equal service, and the receiver was to pay the company 25 cents out of every 35 cents taken from Rice. Perceiving that his opportunities had been subjected to severe limitation by some obscure agency, Rice caused inquiry to be made by Judge Baxter, of the Federal court, who speedily unearthed this compact and removed the

receiver from office. The latter asserted that he had consented "reluctantly" to the agreement, which involved, Judge Baxter said, "discrimination so wanton and oppressive that it could hardly have been accepted by an honest man." A judge, he added, "who would tolerate such a wrong or retain a receiver capable of perpetrating it, ought to be impeached and degraded from his position."

As the court had control of the road, it was not a difficult matter in this instance to bring a discriminating compact to light, but the same method of limiting opportunity, unless volumes of published testimony are false, had been in use elsewhere and was used in other places thereafter, for the effectual restraint of rising young men who had set out to refine petroleum. It appears to have been thought by their elders, interested in the company which frowned upon George Rice's humble efforts, that it would be better for them to take advantage of "opportunities opened for thousands" elsewhere, and to invest their "small savings" in Standard Oil shares.

The Social Question in Colleges

It is a commonplace observation that a student learns more from his classmates than from his teachers. But it is a difficult matter to say what can be done to alter the curriculum and methods of this informal and unofficial part of education when they deviate too widely from those laid down in the college catalog. That there is such a deviation, amounting in some institutions to practical opposition of aim, has at last become generally recognized, and more or less radical and determined efforts are being made to change it. It is not a renewal of the old and never-ending complaint that students do not study so hard as their instructors think they ought to, but the realization that the intellectual life which the institution is supposed to foster has become subordinated to a form of social life which gives a very different kind of training. The situation has not been more happily characterized than by President Wilson in his recent report to the trustees of Princeton:

"We realized that, for all its subtle charm and beguiling air of academic distinction, Princeton, so far as her undergraduates were concerned, had come to be merely a delightful place of residence, where young men, for the most part happily occupied by other things, were made to perform certain academic tasks; that, altho we demanded at stated times a certain part of the attention of our pupils for intellectual things, their life and consciousness were for the rest wholly unacademic and detached from the interests which in theory were the all-important interests of the place. For a great majority of them residence here meant a happy life of comradeship and sport interrupted by the grind of perfunctory 'lessons' and examinations, to which they attended rather because of the fear of being cut off from the life than because they were seriously engaged in getting the training which would fit their faculties and their spirits for the tasks of the world which they knew they must face after their happy freedom was over."

It is not to be supposed that conditions at Princeton are essentially different from other universities of its class. What is different about Princeton is the determination to remedy them by radical measures. The adoption of the preceptorial system has done much toward getting the students to take an active and personal interest in their work, and the next step proposed is the abolition or absorption by the university of the upperclass clubs. These correspond to the Greek-letter fraternities in other colleges, substituting the life and ideals of the clubman for those of the student and breaking up the university into rival factions. President Wilson proposes to prevent this by housing all the undergraduates in university dormitories, each "quad" to contain members of all four classes and the faculty.

A very different remedy for the same disease is proposed by Clarence F. Birdseye, a prominent lawyer of New York City, in his recent book, "Individual Training in our Colleges." Mr. Birdseye perceives the evils of modern American college life as clearly as President Wilson, and denounces them in more outspoken language, but he regards the fraternities as instruments of regeneration instead of stumbling blocks to educational progress. He calls upon the alumni to change the tone of college life by exerting a direct personal influence, especially thru their fraternities. The selective and exclusive features of the fraternities, which President Wilson would do away with, he regards as essential and beneficial.

Both plans, opposite as they appear in form, have essentially the same purpose, that of breaking up the horizontal lines of stratification in colleges by a new perpendicular or slaty cleavage. Our students, left too long under the tutorage of their own classmates, have developed false ideals and vicious habits that in many cases unfit them for active life. Any plan that will bring them again under the informal continuous influence of their elders will be an improvement.

We are, therefore, glad to see so many different plans proposed, and we hope they will all be tried wherever possible. The English college system, the denominational hall or "hostel," the fraternity house under alumni control, the compulsory dormitory system, the boarding clubs and the other indenominable methods all have their special advantages in particular cases. A separation into small groups of congenial associates is inevitable, and is in itself not objectionable. As soon as a college gets beyond the stage when the student body is composed of

"Two nephews of the President
And the Professor's son"

it is bound to break up into cliques and clans. The only thing to do is to see that these are kept as free, ephemeral, voluntary and natural as possible.

We cannot expect any of these measures will solve the question completely, for the evils complained of are due to the abnormal conditions of university life. The student during these four impressional years of his life is artificially isolated from the most important influences of society. He is isolated, first, from industrial pressure, second, from family life, third, from the opposite sex of his own age. In the smaller Western colleges, where most of the students earn their own living at least in the summer, where they live at home or in private houses and where they work with women of their own class, these particular evils are largely absent, tho they have troubles enough of their own in other ways. The barracks and the monastery at their best cannot be made satisfactory training schools for actual life. So long as college students are treated as a peculiar and privileged class they will continue to develop abnormalities and deficiences that will alarm their parents and teachers.

Augustus Saint Gaudens

AMERICAN art has suffered an irreparable loss by the death (on Saturday, August 3d, at his summer home in Cornish, N. H.) of Augustus Saint Gaudens. For he was one of the few great artists who have made it possible to maintain, seriously and without fear of derision, that there is such a thing as American art. His genius ranks among the loftiest yet produced by America in any kind or classification. And, even to those who did not know the winning personality of the man or his perfectly normal and wholesome individuality, but who do appreciate beauty, truth and nobility in whatsoever manifestation, there is poignant sadness in the knowledge that death has stayed the hand of this sculptor while he was yet in the prime of his powers—in only his sixtieth year, and with the promise of so much more beautiful work left unfulfilled. His latest works were indubitably not only his largest, but his finest creations.

Saint Gaudens was thoroly and typically American, despite the fact that he was born in Dublin (March 1st, 1848) of an Irish mother and a French father. He enjoyed the influence of American environment from earliest infancy, for his parents came to this country when he was a babe in arms, and America always remained his home. With only a meager early schooling and after a laborious apprenticeship of some six years at cameo cutting in New York, he went to Paris and studied sculpture under Jouffroy. But his father's land got slight hold upon him. The work of his maturity was concerned almost wholly with American subjects. No native-born sculptor was ever more American than he. None has ever succeeded so completely in bodying forth in stone or bronze such magnificent visions, such sympathetic and powerful presentations, of the nobility of American manhood. His "Deacon Chapin" has been aptly called "our greatest artistic expression of Puritanism." His "Farragut," which, tho one of his earlier works, will always stand as one of the great achievements

of American sculpture, is both the typical American naval commander—alert, businesslike, patriotic, yet dignified, serene, courteous—and a true portrait of a noble soul. His "Lincoln" is the best plastic embodiment the world can want or hope for of the Great Emancipator—standing without abatement of his "homely" qualities, yet with a dignity that is sublime, a sympathy and pathos almost tear-compelling and a veiled power that sways the hearts of men. His "Sherman" is as brave a soldier as ever bestrode a horse, but a fighter whose brow is crowned with a vision of peace—and again this statue is a simulacrum of wonderful fidelity to the gruff campaigner who was at heart a peace lover and a kindly soul. His "Cooper" is the incarnation of philanthropy.

Character was the end and object of this sculptor's untiring quest. He was a psychologist in bronze and marble. His great portrait statues stand in a class by themselves, and his work in this class is unique for its profundity of spiritual meaning. By some subtle and mysterious power he was able to envisage for us not only the physical presence, but the souls of our heroes.

To his birthright of Celtic imagination and Latin love of form Saint Gaudens added a surpassing technical proficiency. But this came only with long and patient toil. Almost he might be instanced as a fresh exemplification of the old definition of genius as the capacity for taking infinite pains. His sympathies in his art were with the spirit of the Renaissance—the spirit of individuality—and he was the first to lead American sculpture away from the imitation of the classic forms of Greece. His portrait plaques and medallions in low relief—notably the exquisitely beautiful and suggestive portrait of Robert Louis Stevenson — have the charm of Donatello at his best. Open-minded fellow artists and competent critics alike are almost unanimous in ranking his Sherman statue as next to the "Colleone" of Verrocchio and the "Gattamelata" of Donatello—the third greatest equestrian statue in the world—and, indeed, even those great monuments of the Renaissance do not surpass this splendid composition in structural grandeur.

Versatile in a wide range, of a sensitive and extraordinary skill, simple, sane and noble in his nature as in all his works, Augustus Saint Gaudens was a world figure in the art of his time; the Old World as well as the New delighted to honor him; his fame is international, and his loss is not America's alone, but the world's.

It is singularly appropriate that such representative centers and such widely separated cities of this broad land as Boston, New York, Philadelphia and Chicago should have each a share in the masterful creations of this foremost of American sculptors. Their possession is a priceless boon. For the educational value of such glorious monuments to the great captains of the Civil War period is inestimable—not alone as examples of a pure and noble art, but also as historical portraits of the nation's leaders, which at the same time epitomize the causes and the struggles in which they led; the influence of such monuments in inculcating patriotism is invaluable.

The Mother's Duty

Our editorial in The Independent of July 18th, "A Great Refusal," in which we discussed the question of the large number of mothers who refuse to nurse their children, thus greatly adding to the infant death rate, proved a subject of great interest to many readers, if we may judge from the communications received in the matter. We have no statistics of the number of mothers who refuse to nurse their children in America, and so perforce our editorial was founded on the German statistics, which show that at the present time probably not more than one out of four of the mothers of the German capital nurse their children.

There has been a constant reduction, almost startling in extent, during the last fifteen years. In 1890 more than one out of every two mothers nursed their children. In ten years it had dropped, however, so that only one in three did so. In the next five years a still further reduction, not only actual, but in proportion to the previous diminution, had taken place. Now but one in

four performs this maternal function. German mothers are usually considered to be a little more capable and a little more ready to nurse their children than the mothers of most other countries. We argued, therefore, that the conditions in our large cities in America were probably at least as bad as those disclosed by the census of Berlin in this matter.

We said that probably four out of five mothers were capable of nursing their children. This opinion was given after consultation with a number of doctors whose experience in the matter should be sufficient to make them judges, and who considered that the estimate was rather conservative than radical. One of our correspondents has suggested that this is entirely too high an estimate of present-day mothers' capacity in this respect. She quotes some statistics, published in an article on "Alcoholism and Degeneration," in THE INDEPENDENT of February 2d, 1905, by E. C. I. Miller, M.D., with reference to the loss of the nursing power in women. These statistics are also from Germany, and were collected by Professor Bunge, who holds the chair of Physiological Chemistry in the University of Basel. Professor Bunge states that out of 1,600 women that had come under observation, about 500 had been unable to fulfill their maternal duties in this matter, because of failure of the function consequent upon the chronic alcoholism of the father. How much of this statistical conclusion may be due to the fact that Professor Bunge was engaged with a particular class of patients suffering from special forms of morbid conditions due to chronic alcoholism is hard to say. Even if the statistics were to be taken at their full value, however, they would indicate that only one out of three mothers were, under the most unfavorable conditions, incapable of fulfilling their maternal function, while, according to the Berlin statistics, three out of four of them are refusing to do so.

There has probably been a noteworthy increase in recent years in the number of mothers who cannot perform this extremely valuable function for their children. This is due partly to certain habits of dress, which have led to compression and consequent failure to develop, to some extent at least, the organs necessary. Such compression makes no difference in strong, healthy organisms, but does have a distinctly deleterious effect in more delicate individuals. There is another factor in this reduction of capacity which is important. The suffering incident to the parturition of the first child is sometimes so severe, or at least is considered so, by a generation that is intent on suffering just as little pain as possible, that the nursing function is sometimes interfered with for a time by the mental as well as the physical condition which follows, and during this period the determination not to attempt nursing is reached. Subsequent births in this family will be likely to be followed by a like determination, tho a little perseverance the first time, if it was realized how much the health of the child depended on it, would probably have restored the function to normal and made it quite available for subsequent occasions.

It is the greatly increased danger to the child, both as regards mortality in early life and weakness of constitution, even should there be survival, which constitutes the only reason for discussing this delicate matter. A correspondent from Germany suggests that our editorial of July 18th could safely have gone a step further, and emphasized the fact that the mortality among children under one year of age in Germany is appallingly great, and that the failure of mothers to nurse their children is constantly combatted by the press, by societies, etc., etc., as the chief cause of this mortality.

Not long since attention was called in the German papers to the fact that the statistics of nursling mortality in Germany during the past five years averaged something more than 20 per cent. of all the children born alive. About 2,000,000 children are born in the German Empire every year and 400,000 of these die during their first year of life. While there has been a great reduction in the mortality of adults during the last generation, there has not been a corresponding diminution in the mortality of children under one year. At the present time more than one in three of all the deaths in Germany occur among nurslings. What has made the comments of the German papers especially bitter is the fact

that among other Teutonic peoples in Norway and Sweden, where the custom of nursing children has not suffered such rude interruption, the mortality of young children is not more than one-half so great.

All are convinced that the reason for this great infant mortality in Germany is the refusal of mothers to nurse their children. There are statistics from other countries which show practically the same thing. In reviewing Sir John Gorst's book on the children of England in THE INDEPENDENT we called attention to an experiment in an English town which shows how much infant mortality may be influenced by factors ordinarily not considered as of importance. The mayor of the town offered a sovereign as a birthday present to every child born during his administration provided it was represented to him alive on the completion of its first year. Strange as it may seem the infant mortality of the town was reduced more than one half during the next year and mothers were quite willing to accept the advice of charitable visitors and settlement workers in the matter of taking care of their children, in order that they might be able to gain the coveted prize. It was evidently not so much for the money, tho that doubtless had its influence, as for the honor of being able to present a healthy child that counted for so much in the additional care bestowed on the children.

In Germany they have tried this plan to some extent and have found that it worked very well. Prizes are offered by the municipalities to mothers who nursed their own children. Women working in families have, in some locality, been permitted without loss of wages to go to their homes once in the forenoon and once in the afternoon to nurse children, and after the birth of the child, have been allowed longer leaves of absence on pay or part pay, if there was a doctor's certificate to the effect that they were nursing their children. It would seem as tho such paltry considerations would not mean much in a matter like this that involved the deepest maternal feelings. Unfortunately instincts have been to a great extent crowded to the wall in our modern sophisticated life and the consequence has not been so much of happiness as seemed to be promised. There appears to be no doubt, however, that it is a voluntary refusal and not incapacity which is leading mothers to subject their children in such large proportions to all the dangers consequent upon artificial rather than natural feeling.

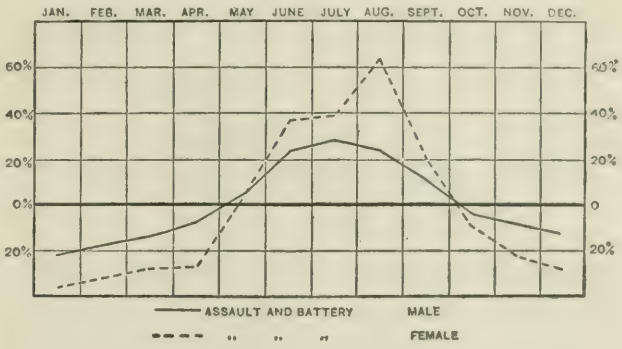
The Extravagance of Our Forefathers

THERE are many things our ancestors did that we cannot approve of, but perhaps nothing shocks us more, when we think of it, than their wasteful habits. The modern man supports his family on what his grandfather threw away. It appears that once they butchered animals for their meat. To our economical minds this is as shocking as to read of hunters on the Western plains who slaughtered buffalo by the thousands to get their hides. Nowadays the packers could afford to give away the meat because they make more money out of what used to be mostly refuse. Still, they are not satisfied. They keep experts at work all the time shortening the process so fewer people need spend their time at this necessarily disagreeable work. Their chemists run after the doctors, crying, "Here's a useless organ. Can't you use it in your business?" And the doctors hunt around until they find a use for it, in stopping blood, curing cretins, digesting banquets or something else.

The dump-heaps of our ancestors are our mines. We go over them and pick out the precious metals they left, the gold, uranium and radium. Whenever they made anything they were just as likely as not to throw away the most valuable part. When they made soda they let the chlorine escape into the air, contaminating that, instead of utilizing it to make bleaching powder for purification. When they made charcoal, they let the alcohol and the vinegar and a hundred valuable medicines and perfumes go up in smoke. It was like burning up a whole drug store. When they made iron they let the slag go to waste instead of making cement for walks and bridges and houses out of it. When

they picked the seeds out of cotton they threw them away, never thinking how much salad oil could be got out of them. When they made beer they let the carbonic acid go off into the air instead of saving it, as the brewers do now, to make soda-water for the people who will not drink beer.

The farmer's wife who put her wood ashes into a wooden hopper in the back yard thought she was economical, but when she made her soap she threw away the glycerine, never dreaming that she might blast out subways with it or blow up a Czar. Into the fireplace were thrown great logs, enough to print a Sunday edition of a yellow journal. Perhaps a hundredth part of 1 per cent. of the heat it produced reached the joint turning on the spit or the shivering limbs of the household. The ancient Chinese way of roasting pig was miserly in comparison.



When they used coal they burned it right up under the boiler in making steam. If they had had any ideas of economy they would have made gas of it and exploded that in the cylinder, conveying power from a central plant with little leakage by electric wires. When they made gas for lighting they did not even take the trouble to save the ammonia and the sulfur. To celebrate a political election the boys were allowed to burn barrels of tar, sending up in nasty smoke finer perfumes than attar of roses, flavors of more fruits than the botanist knows, dyes of more colors than there are in the rainbow, and medicines that cure all the diseases that the flesh has since become heir to.

Nowadays, when we practice our stricter economies, partly on account of their prodigality, our filial respect for them is impaired by the thought of their lack of consideration for us, their heirs. We would not mind their waste of time and labor, foolish as it seems, if they had not also squandered the world's capital, its natural resources.

Those were the days when pins were saved, when carpenters stooped to pick up dropped nails, and scraps of paper were pasted together to make notebooks. If they had had forethought they would not have shaped pins and nails expensively by hand and made paper out of such valuable material as rags. Penny wise and pound foolish our grandfathers were. Of course, we must remember that they did not know any better, but to read of their carelessness is like watching a child burn up the paper money that he has found in his father's desk.

Midsummer Madness

That there is a "tidal wave of crime now passing over the country" cannot be denied. There is every summer. It is as regular in its appearance as any water tidal wave. Here is a sketch of it bor-

rowed from Dexter's "Weather Influences." It is based on the police records of the City of New York for the years 1891-93, including about 40,000 cases, the curves for men and women being plotted separately to show how much more susceptible to weather influences women are. It appears that crimes of violence increase and decrease directly with the temperature. This is, of course, partly due to the opportunities and occasions for such crimes in the good old summer time, the greater number of holidays and disturbances of the ordinary routine of life, but the direct influence of the weather is the determining factor. Given the temperature, humidity and barometric pressure of some date in the future, the sociologist will tell you with considerable accuracy how many people will try to fight, how many mistakes the bank clerks will make and how the students will behave at school. At least he will come as close to it as the Signal Service can on its weather predictions. The most alarming feature of the present "carnival of crime" is not the insane acts of a few perverts, but the disposition of otherwise sane and well meaning people to attack any one suspected of the crime without regard to law or probability. In New

York City several innocent men who had the bad luck to run or look confused at the wrong time have been pursued by mobs and beaten nearly to death. If the police would hold the leaders and inciters of these riots responsible, human life would be safer on our streets. A criminal crowd is worse and more dangerous than a criminal individual. No doubt these howling mobs consider themselves in some dim way the instruments of justice, the chivalrous protectors of women and children, but for the most part this is a mere pretence to cover their gratification of primitive blood-lust, the oldest sport of the race.

"Go stalk the red deer o'er the heather;
Ride, follow the fox if you can!
But, for pleasure and profit together,
Allow me the hunting of Man—
The chase of the Human, the hunting of Man."

The Exclusion of Women From Hotels

As our cities become more and more Europeanized women are treated with greater contempt and injustice. A hardship of especial barbarity is the refusal to give food or lodging to a lady unless she has a gentleman attaché. This means that a young and inexperienced woman arriving late in a strange city is liable to have to walk the streets all night or take refuge in some disreputable place or go to the station house. On account of this hotels especially for women have recently been opened, but these are inadequate and often inconveniently situated. We know of a girl, a college graduate, who on account of a delayed train, arrived in New York City late at night. Notwithstanding the facts that she was manifestly refined and respectable, and had the best of credentials, and that the porter from the station went with her to explain the circumstances, no first-class hotel would give her shelter, and she had to go to a house of lower grade, where she was kept awake all night by the noisy swearing crowd of men in the barroom just across the thin partition. The Hoffman House in New York City last week refused to serve Mrs. Harriet Stanton-Blatch and a lady friend in their public restaurant in the daytime because they had no man with them. Fortunately Mrs. Blatch has her mother's courageous spirit of resentment to injustice, and she will bring suit for damages against the hotel to establish the rights of unattended women. We hope she will succeed. There ought to be a law revoking the license of a hotel or restaurant that refuses to receive women on the same terms as men. A still more efficient measure would be for all self-respecting women to refuse to patronize, even with masculine accompaniment, any place that insults their sex by such a rule.

A Question of Heresy

It is reported that the Rev. Henry F. Waring, a Baptist pastor of Halifax, Nova Scotia, is to be accused of heresy at the General Convention of Canadian Baptists which meets August 23d. Mr. Waring has recently published a book entitled "Christianity and its Bible," one of the excellent "Constructive Bible Studies" of the University of Chicago Press. The aim of the volume is to furnish a text-book for a Bible class, or even a whole congregation, on the origin of the Old Testament religion and of Christianity, the history of the Church, and the present-day doctrines and activities of the Christian faith. The book covers a good deal of ground, and of necessity suffers somewhat from brevity, but, on the whole, it is well adapted to meet a real need. The spectacle of a large number of congregations devoting themselves with serious energy to the acquirement of religious knowledge with the aid of a modern and progressive text-book such as Mr. Waring's would be a sight to cheer believing optimists. We doubt if the author can be convicted of heresy on the basis of this volume. It is liberal in spirit, cordial in its attitude toward historical criticism, but cautious in acceptance of new views, and sincerely religious in temper. Canadian Baptists will show themselves more reactionary than their American brethren if they refuse to tolerate such very moderate heresy.

The Pageant and the People

To make a local historical pageant anything more than an ordinary stage spectacle requires the sincere co-operation of the people of the

place. That is what was the matter with the pageant last week in Coventry, England. There were plenty of candidates for the rôle of Lady Godiva, in the historically correct costume, but the people of Coventry were not willing to play their part in the drama. When the original Lady Godiva rode thru the town to obtain a rebate on the taxes all the inhabitants went into their houses and kept out of sight, all but one, and he suffered a sèvere and appropriate penalty. But this exemplary punishment has failed to influence the present inhabitants of Coventry. They have all become Peeping Toms, so the modern representative of Godiva could not ride thru the town clothed only in chastity, but had to assume somewhat more substantial habiliments. What can be done with these degenerate descendants of sires whose heroic self-denial has been the theme of song and story for seven centuries? They cannot be "sent to Coventry," for they are already there.

Our Federal Judge in China

We have received a communication from Bishop Bashford of China in regard to the newly established United States Circuit Court of China and its able and high-minded Judge, Lebbeus R. Wilfley. It seems that Judge Wilfley's somewhat drastic action in demanding an examination of all American lawyers who proposed to practice before the court and his disbarment of six or seven of them has stirred up such a commotion that the Senate has been prevailed upon to pass a bill to restrict his authority. We have looked into this matter, and find that Judge Wilfley has the support of all the better foreigners and newspapers in China. Not only has he struck terror in the hearts of some American criminals, who apparently have made China their last refuge, but he has contributed markedly to deliver respectable Americans of the port cities from the disgrace which was becoming associated with the American name. As the *China Times* in a recent issue says:

"The experiences of the United States in the Philippines have taught her something. All the vices that have been introduced by foreigners to natives have been attempted also at Manila, from opium-smoking to the licensing of authorized prostitutes; and they have failed. America now realizes what is meant by the white man's burden, and is taking on her shoulders a heavy part of the load. How long she neglected it we are all well aware in the Far East. The registration of the prostitutes of the town under the American flag had become the usual thing; and further, it may be recalled, if only as a thing of the past, for the benefit of those with whom these things are not past, that the term "American lawyer" was being rapidly degraded to much the same level, also not without grounds. The cleansing of the Concessions from the wastrels and criminals of both sexes who sheltered themselves under the American flag is scarcely a more important work than the raising of the standard of the legal profession."

Our readers will remember an article by Judge Wilfley, which we published in THE INDEPENDENT last February, on "American Law in China." He has proved himself an honorable and fearless judge, and he should have the support of the President and Congress. The bill aimed against him and past by the Senate should be killed in the House.

Speaker Cannon and President Nelidoff

A writer in the current issue of the *Forum* says:

"The House of Representatives no longer consists of 356 members, but of one man, the Speaker. It is a condition which is un-republican, un-democratic and un-American. The criticism which it invites is not directed against Mr. Cannon, who will, undoubtedly, be again chosen to wield the gavel, and who is deservedly popular. The question is not one of personality, but of a system. There ought to be a larger latitude for the exercise of the responsibility which rests upon each member of Congress as the representative of a constituent part of the great republic. As it is now, individuality is suppressed and independence is apt to be disastrous."

They do things differently at the Congress of the Nations at The Hague. There every delegate, being considered the personal representative of his sovereign, serves on any and every committee he wishes to. M. Nelidoff, of Russia, the president of the Conference, would not think of assigning Baron d'Estournelles, of France, or Mr. Choate, of the United States, to any specific committee. Yet one gentleman from the State of Illinois is permitted to assign the thirty-seven members from New York to whatever committees he chooses.

The Change of Hymn Books

Last week when we asked among our editorial brevities "Why is it that the first thing a pastor does after he gets a new church is to change the hymn books?" it was something of a rhetorical question. We had an idea that it was, to use Lord Dundreary's familiar phrase, "One of those things no feller can find out." But one can find out more than he thinks if he asks questions, and we have been favored with a reply from the Rev. Frederick A. Gates, of Ridgebury, N. Y., who has not changed his hymn book, but has a very definite idea of why he wants to and why he cannot. Besides such causes as the improvement in musical and literary taste, he says:

"Another particular reason for changing hymn books is that the most of our church hymns were written under past experiences, which we do not so much feel now, and the progressive pastor is ever expecting that he will find in some new book an expression of the religious life of to-day. In this he is usually disappointed, for there are not enough new hymns being written to supplant the old in our dignified service of the church. For schools and revivals the output seems adequate, but the quality very inferior. Hymnology is suffering, just as poetry is suffering, for want of writers of merit and present-day religious feeling.

"Again, the theology of the Church in general has experienced a changed emphasis, so that the pulpit is no longer preaching the thoughts which the pew is pouring forth in song. Hymnology has not advanced in line with the changing order of the pulpit, and accordingly is out of harmony with the preaching topics of today. Take the most conservative preachers, and how very often is Christ Jesus presented by them consonant with 'There is a fountain filled with blood'? When youth and activity are the notes struck by our preachers today how discordant for them to bid their congregations sing 'My days are gliding swiftly by.' When gospel extension is the watchword, why sing any longer 'I'm but a stranger here, Heaven is my home'? The sermons on the glories of Heaven preached nowadays are as rare as those on hell fire. People are not thinking so much about the future life as they used to; the clergy are not preaching on these topics as they did, and why not retire our hymns on these topics? I like the words 'Guide me, O thou great Jehovah,' but I object to being called a 'pilgrim' and this earth 'barren.' I might go on almost *ad infinitum* in criticising some of our old hymns, but will spare the effort. Suffice it to say that I am so out of accord with the hymns in our present book and in such despair of getting anything much better that I do the best I can with what the book affords. People would not listen to old sermons of a century ago, yet will cling to old hymns as if they were part of the inspired Word. Pastors can see this discrepancy, and are trying, perhaps in vain, to remedy it."

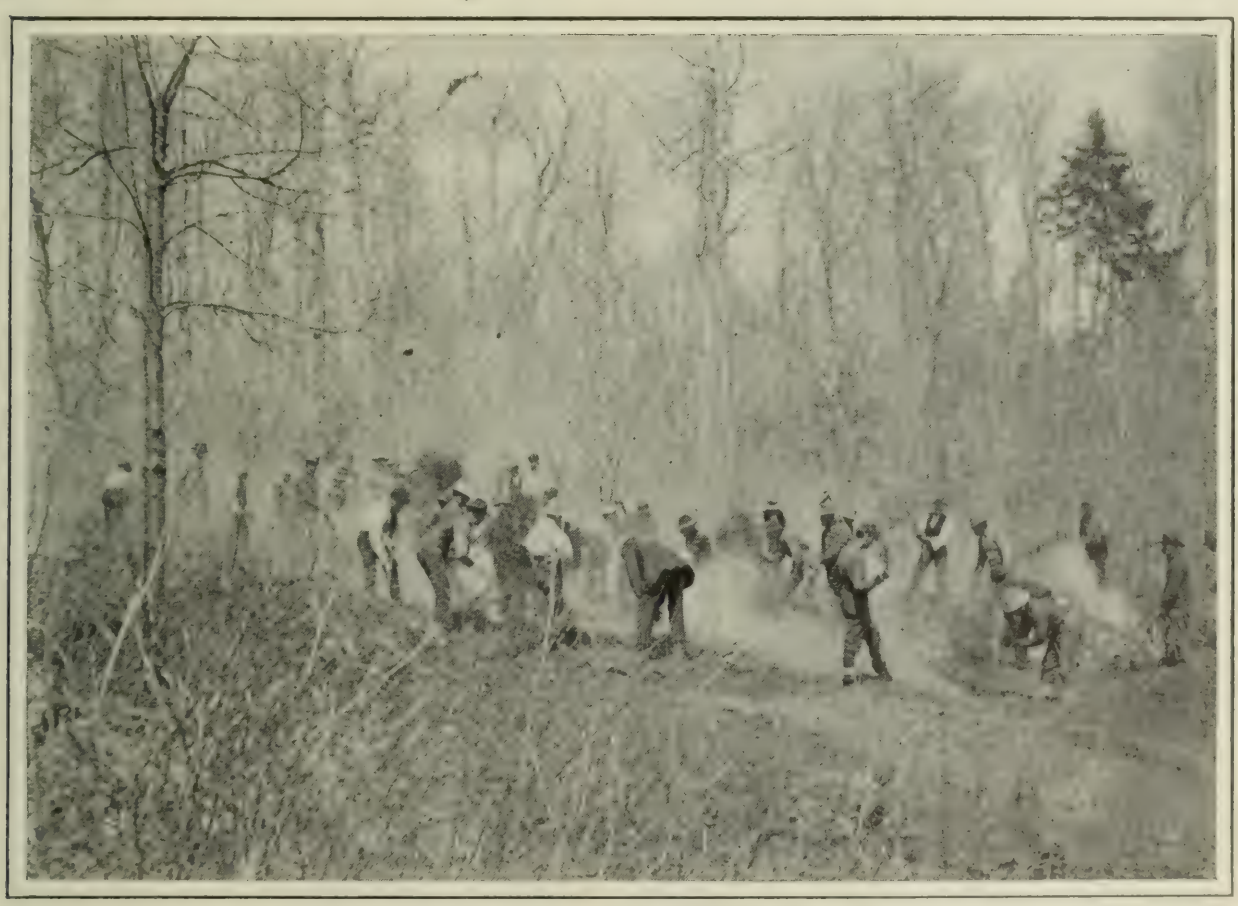
Before the International School Congress in London last week, Dr. Sir James Crichton-Browne defined love at first sight as being "first, a species of cerebral commotion, and, second, the stirring of some hitherto dormant association centers by an appropriate affinitive impression." The scientific value of this transcendent discovery is almost equal to the conclusions reached by an American university a few years ago when an investigation was made of a large number of school children to discover their preference for dogs or cats. The astonished world learned that most boys loved dogs best and most girls cats.

Children used to be taught to say, "The earth is round like a ball." This is altogether too inexact to suit modern science. Prof. A. E. H. Love, of the Royal Society, proposes the following definition, which he regards as "approximately" correct. Primary teachers please copy:

"The lithosphere is an ellipsoid with three unequal axes, having its surface deformed according to the formula for a certain spherical harmonic of the third degree, and displaced as a whole relatively to the geoid in the direction towards southeastern Europe."

The world moves. Three new evidences of it this week. A straw hat has been worn into the House of Lords, an automobile has gone from Pekin to Paris; it is announced that the Jamestown Exposition will be complete in ten days.

THE INDEPENDENT has the defects of its qualities, or, to use a shorter and uglier word, its faults, but at least we have published no jokes about Boston's "Old Home Week."



It does not necessarily indicate a higher standard to be able to see more faults in anything than other people.

"Some books are to be chewed," but very few of them are worth Fletcherizing.

The Control of Forest Fires

NEXT to the destroying pulp mill, fire has long been the worst enemy of the forest. With the growing scarcity of untouched forest areas the fire hazard in connection with timber growth is assuming greater and greater proportions. In far too many cases the risk of fire has been considered so great after lumbering that owners of timber lands have not tried any system of conservative logging, but have preferred to cut the forest clean, under the belief that young timber would almost certainly be burned, if suffered to remain, before it could attain sufficient growth for a second crop. On the Pacific Coast this idea has become a tradition, and in the heavy forests of that region fires have been so prevalent that they have come to be regarded as necessary evils that must always be associated with timbering. A single fire among young trees may not always kill them, but it is certain to check their growth, and by weakening them renders them particularly susceptible to the attacks of insects and more liable to fungous diseases. The persistent recurrence of fires, however, results at last in the total destruction of the whole forest stand, and then chaparral takes possession. Thus large forest areas are denuded, both East and West, and losses sustained in more ways than those measured by financial standards. On cut-over lands there is, generally speaking, a great accumulation of débris which is provocative of dangerous fire conditions, so that one of the first steps in fire protection is some provision for the removal of débris.

Forest fires cannot be controlled by accident. The only safety is to be found in system. The fire-fighters, being on the ground, can combat the destructive element after the fashion shown in the accompanying photograph. Studies made by the Forest Service and the State of California in 1904, in relation to the subject of the control of forest fires, showed conclusively that by proper care it is possible to decrease the danger from forest fires. Such protective measures may be carried out at a reasonable cost, which ought not to exceed two cents gross per acre per annum.

ATTACKING A FOREST FIRE IN TIME.

Financial

Decline of Stocks

BEGINNING on Monday afternoon, the prices of stocks on the New York Exchange declined thruout last week. Sales amounted to 4,402,000 shares, against only 2,396,000 in the week preceding. Nearly half the week's business was done in Union Pacific, Reading, Amalgamated Copper and Steel common. In the following table—which shows Saturday's closing prices, the week's losses, the low figures reached in March last and the highest prices of 1906—the stocks are ranged in the order of their activity, Union Pacific, 866,400 shares sold, standing first; Reading, 789,000, second; Amalgamated Copper, 481,900, third, and so on down the list:

	High. 1906.	Low. March.	Close 10th.	Loss for Week.
Union Pac.	195⅝	120¼	127¼	16
Reading	164	91	91¼	11½
Amalg. Cop.	118¼	78½	74⅝	9¾
Steel com.	50¼	31½	31¾	3¾
Am. Smelting	174	104¼	98¼	14
So Pac.	97½	69¾	82⅝	6¾
North Pac.	232½	114¼	120	11⅞
Penn.	147½	114	118⅛	4
St. Paul	199⅛	122½	122	10¼
Atchison	110½	82⅝	85¼	6⅝
Gt. North.	348	126	121¾	10⅜
Steel pr.	113¼	91½	96	2⅞
B'klyn R. T.	94⅛	45¼	49	8
N. Y. Cent.	156¼	111½	105½	5⅝
Anaconda	75	53	48	5¾
Can. Pac.	201½	155	166	9¾
Erie	50⅞	21⅞	22	1⅝
Sugar	157	114⅞	113	8
Inter-Met. pr.	87⅝	52	34½	8½
Balt. & O.	125⅛	90⅛	93½	4¼

Judge Landis's imposition of the great fine, together with the wild rumors that were circulated in the financial district, gave the bears their opportunity. They were assured, it is understood, that they would encounter no opposition on the part of certain strong financial interests, and it is quite probable that representatives of these interests were in the bear ranks. For other reasons, the situation (support having been withdrawn) was favorable for a bear movement, owing to the fall of copper, the attitude of Southern States toward railroads, the possible prosecution of the Union Pacific and its officers, the investigation of the New York street railways, the menace of a telegraphers' strike, and the existence of weary and overloaded speculative pools. General business continues to be in good condition, and corporations that have not broken the laws are not in danger of prosecution.

August Crop Report

THE Government's crop report for August 1, issued on the 10th, is on the whole quite satisfactory, warranting larger estimates of both corn and wheat than were indicated a month ago. An improvement in the condition of corn from 80.2 to 82.8 points to an increase of 88,000,000 bushels in the expected yield, and indicates a crop of 2,648,673,000 bushels, against last year's extraordinary crop of 2,927,416,000, and the 2,707,993,000 bushels harvested in 1905. Better reports for winter wheat and losses in the spring wheat district make a net gain of 4,000,000 bushels for the month and point to a total of 638,350,000. This will be about 97,000,000 less than last year's crop, but the quantity in farmers' hands at the end of last winter was greater than usual. A decline of condition reduces the estimate of the yield of oats from 973,000,000 to 910,000,000 bushels, but this quantity would have been regarded as an exceptionally large crop a few years ago.

....Exports of manufactures in the last fiscal year amounted to $740,314,557, out of a total of $1,854,553,956. For exports to non-contiguous territories of the United States $40,000,000 may be added. Exports of manufactures twelve years ago were less than $250,000,000.

....The Steel Corporation originally decided to expend $75,000,000 upon its new steel plant at Gary, Ind., and the new city to be created there. It will now increase the appropriation by $45,000,000. The Corporation is said to have purchased recently the plant of the Midland Steel Company, on the Ohio River, thirty miles below Pittsburg.

Entered at the New York Post Office as second-class mail matter.

Survey of the World

Purposes of the Department of Justice

Since the imposition of a fine of $29,240,000 upon the Standard Oil Company much interest has been shown by the public in the purpose of the Government concerning the prosecution of other corporations, railway or industrial, and the remarks of Attorney-General Bonaparte have excited general comment. During last week there was a further decline of prices at the Stock Exchange, and interviews of a disquieting nature (some of which have been repudiated) were published. The decline of prices was accompanied by no important failure, and extended inquiries by prominent journals showed that business was in good condition thruout the country. Attorney-General Bonaparte returned to Washington from his vacation on the 12th. In answer to questions he said on that date that the Department of Justice would prosecute in the criminal courts any case coming before it, if it could find the evidence needed for conviction. But it was not his purpose to waste time or effort upon mere underlings or subordinates. Referring again to the recent verdict of a jury in the Licorice Trust case, when the corporation was convicted and its president acquitted, he said, according to the published reports, that the presidents of accused corporations were usually men of good, moral standing in their communities, orderly in their private lives, and frequently engaged in church work. Juries were unwilling to convict such men even if the corporations which they controlled were held to be guilty. The Department, however, was preparing to bring to justice some of the prominent men at the head of corporations which had broken the law. He would not then name any one, "but," he is said to have added, "there is a big covey of game, and it would be a very poor marksman who could not land enough to make a mess." In his opinion, there was evidence sufficient to warrant the Department in believing that several of these men could be sent to the penitentiary. He declined to say whether the Government intended to prosecute Mr. Harriman or Mr. John D. Rockefeller, but remarked that the Commission's report upon Mr. Harriman and the Union Pacific was under consideration. A recently published statement that no proceedings against Mr. Harriman (except the demand for answers to certain questions) were under consideration, he said, had not been authorized. On the 13th, Secretary Root, Secretary Taft and Postmaster-General Meyer were in conference with the President at Oyster Bay. The stock market being in a condition of excitement, many rumors were in circulation. One was that Secretary Root had conferred with several Wall Street financiers at Mr. Morgan's office, and that he was thinking of withdrawing from the Cabinet. Mr. Root said that both these stories were absolutely false. On that day another interview with Mr. Bonaparte was published. He explained why he had thought and still believed that the punishment of responsible officers of offending corporations by imprisonment would be a more effective deterrent than the imposition of fines. Officers of companies that had not broken the laws had no cause for anxiety. "The Government seeks to punish only those

who have deliberately and defiantly violated the laws of the country." On the 14th, in answer to the question whether "the business of the great corporations of the country generally" was "conducted on such unlawful principles that the prosecutions deemed necessary by the law department of the United States" would "unsettle industrial conditions and lessen our prosperity," he said:

"I know of no facts which justify any such statement. There have been violations of Federal statutes by some corporations and by some individuals, and, so far as this department can accomplish it, the guilty corporations and the guilty individuals will be brought to trial, and, when convicted, to punishment; but the number of each is small, and the vindication of the law can, in my opinion, have only a beneficial effect on the prosperity of the country, although it may demoralize some speculators."

Two days later, his attention was directed by the Associated Press to criticisms in certain papers of his "alleged levity, sarcasm and want of dignity" and the "reported effect" of his utterances "upon the stock market." Some of the interviews ascribed to him, he then said, were true, some had a basis of truth, and some were wholly fictitious. But he could not understand how sensible men could be affected in dealing with matters of business by the remarks attributed to himself:

"I should say that business men ought to wish to have the laws strictly and impartially enforced. If this is done everybody knows what he can do and what he cannot, and everybody has a fair field and no favor. The Department of Justice proposes to do precisely this and nothing more. It is required by law to enforce certain penal statutes which make certain forms of action crimes against the United States, and also provides remedies for such illegal action.

"The department, since I have been at its head, has never taken proceedings to enforce the laws without a careful preliminary investigation. Moreover, it has consistently and frequently overlooked merely formal violations of law or offenses attended with trivial consequences and has invariably refused to intervene in such cases when there was reason to suspect that intervention was desired to further private ends. It has been, on the whole, exceptionally successful in the results of the litigation it has undertaken—a fact which of itself shows that this litigation had been preceded by thoro inquiry.

"If the ground of complaint against the department is that it proposes to punish prominent and wealthy men, or corporations having vast amounts of capital and engaged in very extensive business when these are shown to have been wilful and persistent law breakers on a great scale and with grave injury to the purposes of the law, I must admit that these complaints are well founded. That is precisely what the Department of Justice is trying to do, and while I remain its very unworthy head will continue to do, so far as it can."

Immunity for the Alton Road

Immediately after the great fine had been imposed upon the Standard Oil Company, at Chicago, Judge Landis ordered the calling of a special grand jury to consider the conduct of the Chicago & Alton Railroad Company, which granted the special and unlawful rates to the Oil Trust, and also to inquire whether officers of the two corporations were guilty of conspiracy. This action appears to have been taken without the approval of the Department of Justice. It soon became known that immunity had been granted to the railroad company in consideration of the assistance given by it to the prosecutors. This concession was made by C. B. Morrison, then District Attorney at Chicago, and now special counsel for the Government. When the new grand jury assembled, on the 14th, Judge Landis said he had been informed by the Attorney-General that prior to the indictment of the Standard Oil Company, Mr. Morrison had made with the officials of the Chicago & Alton an agreement "under which the railroad company was not to be proceeded against, provided it should assist the prosecution with evidence and witnesses in the matter then pending." He continued:

"This presents a very grave question, because it is of the utmost importance that no offender should undeservedly escape punishment for crimes on such a plea, as well as that the meanest criminal may not truthfully charge the Government of the United States with bad faith. What this arrangement was the court does not know, but the court assumes it may possibly have provided that the Chicago & Alton Company should emancipate those who act and speak for it from all obligations to deceive and mislead the jury on the trial lately closed.

"If this be true, whatever officer of the Department of Justice is charged with determining what shall be that department's attitude must have submitted to his careful consideration a transcript of the testimony of all these railroad agents in order that he may intelligently decide whether or not the District-Attorney's arrangement and the railroad company's

performance entitled the Chicago & Alton road to immunity. Whether the grand jury acts in the matter will depend entirely upon what conclusions this official may reach as to what the most perfect good faith requires the Government of the United States to do."

It is said that several witnesses connected with the railroad company were evidently hostile to the prosecution. Attorney-General Bonaparte says that he himself has never agreed to grant immunity to any one; he understands, however, that immunity was granted in this case by Mr. Morrison, with the consent of Mr. Moody, who was then at the head of the department. It is pointed out that Mr. Harriman controlled the Chicago & Alton when the company thus agreed to assist the Government in procuring the conviction of the Oil Trust, and it is reported that on this account the Oil Trust capitalists are no longer his friends.——On the 13th the Government took measures to compel Mr. Harriman to answer the questions which he declined to answer last winter during the Union Pacific investigation. The petition was filed in New York, where arguments will be made on October 21st. Among the questions are those concerning his interest in stocks sold to the Union Pacific, his profits in these transactions and his purchases (if any) of Union Pacific and Southern Pacific in the stock market a short time before the declaration of the 10 per cent. dividend. Otto H. Kahn, of Kuhn, Loeb & Co., who also refused to answer, is a defendant in the same action.

Politics in San Francisco

At the primaries, on the 14th, for the fall election in San Francisco, the result in the Republican party was a decided triumph for reform. The Republican League, which supports the "graft" prosecutions and the new Mayor, electing 130 of the 149 delegates. The opposition (represented by 19 delegates), is said to have been led by Postmaster Fiske. In the Democratic primaries the regular Democrats were successful, and it is said that they will unite with the reform Republicans in support of a ticket. At the primaries of the Union Labor party, however, those who oppose the prosecutions were successful. They will control the party's convention and may even renominate ex-Mayor Schmitz, who is in jail under sentence. Several days before the primaries were held, that portion of the Union Labor party which supports the prosecutions and calls itself "the anti-graft element" of the organization, reported to the District Attorney (in a letter from Michael Casey, chairman of its committee on election frauds), that it had obtained and would submit to him much evidence of colonizing and false registration in the interest of the supporters of Schmitz. This evidence is said to have been taken for the grand jury. ——It is asserted by the San Francisco papers that before the first trial of Louis Glass, Emil T. Zimmer, the other vice-president of the Pacific States Telephone Company, told to Prosecutor Heney and the grand jury the whole story of the company's corrupt dealings with the supervisors, and that for this reason Mr. Heney was greatly surprised when Zimmer refused to testify. The latter is still suffering punishment for contempt.

Yellow Fever in Cuba

At the end of last week, eighteen cases of yellow fever in Cuba had been reported. Ten of these were in Cienfuegos, where two members of the American hospital corps—Sergeant Merritt and Private Sheppard—have died of the disease. Two cases were found at Matanzas, and two at a place near that city and forty miles east of Havana. Two troops of the Fifteenth Cavalry and a machine gun platoon are stationed in Cienfuegos. All except one of the Americans attacked by the disease there were in the hospital corps. Against the protests of the soldiers, the military hospital was placed in the same building with a civil hospital, which, it is believed, was the source of infection, altho the original case has not been found. It is asserted that the local health authorities are incompetent and that Cienfuegos is in a foul condition. This outbreak of fever will furnish fresh arguments in favor of giving the central Government direct supervision of sanitary work thruout the island, and may lead the Government of intervention to decide that the contract for sewering and paving Havana, awarded under the rule of General Wood, must now be carried out. Before the recent

revolution, the Washington Government repeatedly reminded the insular authorities of their obligations in respect to this matter.

The Telegraphers' Strike

At the end of last week there were no signs of an approaching settlement of the telegraphers' strike. The Western Union superintendent at New York asserted that the strike was ended, so far as its effect upon his company was concerned. "We do not consider that we have a strike in our hands," said the vice-president of the Postal Company. On the other hand, strike leaders asserted that they had already won their fight and predicted that the companies must soon yield. There were indications that the companies were doing business under great disadvantages, altho they had a considerable number of men at work. At last reports the 47,000 railroad operators were still in their places, the railway companies not insisting that they should send and receive commercial messages, as required in the companies' contract with the Western Union. On the morning of the 19th it was made known that the strikers in New York had formally requested Attorney-General Jackson to begin proceedings for a revocation of the Western Union charter, upon the ground that the company was sending messages by telephone and express. President Small, at Chicago, made an appeal for funds, saying that the strikers should be prepared for a ninety days' contest.——At Boulder, Colo., on the 10th, the freight depot and other buildings of the Colorado & Southern road were destroyed by fire, accompanied by an explosion of a ton of dynamite which had been stored in a car. Five persons were killed, nearly all of them being citizens who were assisting the firemen. The property loss was $500,000. A strike of employees of the railroad was in progress at the time. Three strikers were arrested and held on suspicion. One of these, John W. Reeve, confessed on the 14th that he had set fire to the cars and depot. To this confession was then added that of Frank Kiser, another prisoner. Following these confessions, the labor controversy was settled by an arbitration agreement.

Central American Countries

Dispatches from the Mexican capital on the 14th predicted war in Central America within four days. This prediction was repeated on the 15th, when it was said that Guatemala and Salvador would attack Nicaragua and Honduras, and that Salvador's President was buying steamboats (with guns for them) in San Francisco. No fresh signs of disturbance, however, were reported from the Central American countries, and the predictions of impending war were received with surprise in Washington, where it was thought that arrangements would soon be completed for a peace conference of all the republics. It had just been made known that Guatemala was about to send her Minister of Finance to Mexico, to meet Secretary Root there, and with his help to seek an improvement of relations between the two countries. It is reported that Captain John P. Poe, formerly a noted football player at Princeton, and an officer of artillery in Honduras during the recent war, has started from Salvador for San Francisco, to recruit a "foreign legion" there. There has been published an interview with Commander Winterhalter, who has been serving on the "Paducah" in Central American waters, and who expresses the opinion that the people of Central America "are not capable of self-government":

> "If one could conceive of such a thing as the five republics of Central America in a confederacy under the protection of the United States there would be no grander countries on earth than Guatemala, Honduras and Nicaragua with all their resources developed. But it will never be under Spanish-American development. Their republics are a misnomer. Their ideas of government are for every man to get into politics for the benefit of himself and his friends, and the people are the sufferers. Such countries could never become places of investment for American capital. Exploitation of the resources of the several States has been the main object of the men who have held power in Central America. All the States, with the possible exception of Costa Rica, have been made the victims of official graft, and the progress of all has thus been immeasurably retarded."

He approves the suggestion that all the countries should be subject to a protec-

torate exercised jointly by the United States and Mexico.——At the request of Secretary Root, Secretary Taft recently undertook negotiations with Colombia and Panama for a settlement of the controversy between these two countries, and between Colombia and the United States, growing out of the secession of Panama. On the 17th, a protocol was signed by representatives of the three Powers, providing for three distinct treaties, the terms of which were not published. It is understood that they involve the assumption by Panama of a part of Colombia's foreign debt.——In Venezuela, on the 12th, the court of first instance, at Caracas, found the New York and Bermudez Asphalt Company guilty of aiding the Matos revolution and imposed a fine of $5,000,000, which was estimated to have been the cost of suppressing that revolt. Additional damages will be assessed hereafter. The company will appeal to the higher court.

The Hague Conference

The Hague Conference has disposed of the disarmament and the limitation of armament proposition by passing the following resolution, introduced by Sir Edward Frye, the first delegate of Great Britain:

> This Conference confirms the resolution adopted by the Conference of 1899 regarding the limitation of military burdens, and as military burdens have been considerably augmented in almost all countries since 1899, it declares it is highly desirable to see the governments earnestly resume the study of this question.

Sir Edward said that the Emperor of Russia in convoking the first conference had chiefly in view to put a stop to the increase of armament, and the solution of this question had in the last eight years become more and more urgent in view of the manner in which armaments had been extended. He added that as the British Government recognized that several Powers desired to restrict their military expenses, it was ready to communicate once a year with those Powers inclined to do likewise, its projects for the construction of new warships, as well as the expenses implied therein, believing that this exchange of news would facilitate the exchange of views between the governments concerned regarding the reduction of armaments. M. Nelidoff, president of the Conference, in a long speech pointed out "that contact with reality" showed the difficulty in carrying out Great Britain's generous idea of disarmament, and he ended by saying:

> "I cannot find any other way to show the interest of the Powers in this question, which, if immature in 1899, is not more mature in 1907. It is impossible to accomplish anything in this direction, and the Conference finds itself today as unprepared to face the question as it was in 1899. Any discussion of the matter, sterile in itself, would be injurious to the cause of peace, as showing the divergence of opinion existing, while on the other hand a unity of intentions exists which may one day lead to their realization."

Then the text of the treaty of disarmament between Argentina and Chili was read, and the whole Conference enthusiastically applauded Señors Drago of Argentina and Concha of Chili, who were chiefly instrumental in bringing about that treaty.——The second commission has completed its work in regard to the regulation of war on land, but the final form has not yet been adopted. It proposes that on the outbreak of war civilians of the nationality of the enemy who may happen to be resident of the enemy's country shall not be expelled; and that all volunteers shall bear arms openly (tho the German proposition that these volunteers shall bear a distinguishing sign was rejected, as well as the Japanese proposition for the adoption of a scale for pay for work done by prisoners of war). No definite decision was reached regarding the important question of the rights of belligerents when traversing neutral territory, but the proposition that prisoners of war should be required to do no degrading work and only such as is suitable to their rank and position was past unanimously. The throwing of bombs and explosives from balloons and airships is also forbidden, as well as the use of asphyxiating gases, tho it will be remembered that in the first conference in 1899 Captain Mahan refused his assent to the latter proposition on the ground that nobody knew how asphyxiating gases were likely to act. ——France's objection to the establishment of an international prize court, as fathered by Germany and England, has been overcome by the proposition that

the personnel of the prize court shall be taken from the permanent arbitration court proposed by the United States. The scheme for a permanent court will unquestionably pass, but one of its provisos will be changed, so that both disputant nations may have judges of their own sitting on the case.——In regard to the future meetings of the Conference Russia has proposed that each Conference arrange for the next one. The Czar says that as Russia has inaugurated these conferences and they are now firmly established, the time is now ripe for them to manage themselves. This proposition of Russia's is different from the American proposition, which requires the conferences to meet quinquennially. Which will prevail is not indicated in the cabled reports.——Russia had originally intended to close the Conference about this time, but the question of the Permanent Court of Arbitration and the periodicity of future conferences will require so much more work that England, Germany and the United States have vetoed Russia, and the Conference will now probably continue until the first or second week of September. It is said that M. Nelidoff, in writing a motto in the album of Mrs. Hill, wife of the United States Ambassador at The Hague, said: "It is easier to make peace with one enemy than with forty-seven neutrals."

The Belfast Strike

A furious and fatal conflict between the troops and the Belfast mob took place on the evening of August 12th. It began with the stoning of policemen and civilians in the streets of the Falls Road quarter. Troops were called to the rescue, and had a hard fight with the mob, which attacked them with stones, broken bottles and brickbats from the street and buildings. Great piles of paving stones had been dug up from the street and arranged in convenient places in preparation for the combat, and chains and other entanglements arranged for tripping the horses of the cavalry in case of a charge. After the soldiers and police had stood the fusilade for three hours and repeated charges with club and bayonet had failed to disperse the rioters, the magistrate read the Riot act, while the mob cursed "the bloody Saxons." Brigadier-General Dawson, commanding the garrison, then gave command to fire, and two volleys cleared the streets. Two men in the crowd and one woman behind it fell dead and fifteen were wounded. Over sixty of the soldiers and rioters are in the hospitals on account of severe wounds. The turbulent quarter was, however, by no means pacified. On the contrary, the firing by the troops on the people still further inflamed their passions, and preparations were made for another attack, women and children being engaged in preparing ammunition, such as paving stones and bottles full of vitriol. Workmen who attempted to repair the streets were driven away with stones. In order to avoid further trouble the troops were withdrawn from the quarter and the priests and leading Nationalists patrolled the streets to keep the people quiet. The Orangemen of the Shank Hill quarter were at the same time kept from resorting to violence by the personal efforts of their leaders. In the meantime negotiations had been going on between the strikers and the employers, and on the 14th an agreement was reached by mutual concessions. The carters will obtain an increase of pay and the employers maintain the open shop.——An attempt was made to assassinate Lord Ashtown at Glenahiry Lodge near Clonmel by the explosion of a bomb under his bedroom. The roof fell and the lodge was set on fire with the aid of petroleum, but Lord Ashtown and the household escaped injury. Lord Ashtown is a prominent member of the Irish Unionists' Alliance and an opponent of the Nationalists. At the recent Galway Assizes, Justice of the Peace Kelly was tried on the charge of inciting the murder of Lord Ashtown in a political speech, but he was acquitted.

The Conferences of the Kings

The series of personal interviews between the most important European sovereigns has excited an immense amount of comment and speculation as to alliances, ententes and the balance of power, but as nothing is really

known to the outside world of what occurred at these conferences it is not worth while to do more than record the facts of the meetings. The first was between the Emperor Nicholas of Russia and the Emperor William of Germany, who met off Swinemünde on August 3d, and an exchange of visits took place between the two imperial yachts, the "Standart" and the "Hohenzollern." Twenty-three ships of the German navy were there brought up in line for review by their Majesties. On August 14th King Edward of England visited the Emperor of Germany at the Palace of Wilhelmshöhe. The King remained at Wilhelmshöhe for ten hours, and then his train went on to Ischl, where Emperor Francis Joseph of Austria has his summer villa. It is reported that a satisfactory agreement was reached between the Emperor Francis Joseph and King Edward on the Macedonian difficulty and the crisis at Morocco.

Anti-Clericalism in Italy

Anti-clerical violence in Italy shows no signs of abating. Churches are set on fire, wayside shrines destroyed and ecclesiastics jeered, spat upon or stoned in the streets. Cardinal Merry del Val, the Papal Secretary of State, was attacked while driving thru Marino, near Rome, and in beating off the mob one of the policemen was severely wounded. The Pope has advised the postponement of the pilgrimages, which were to begin September 20th in honor of the fiftieth anniversary of his entrance into the priesthood, because of the danger and indignities to which the pilgrims would now be subjected in passing thru Italy. It appears that the attack upon the Salesian monks at Varazze was incited by the diary of a fifteen-year-old boy named Bisson in their school, which his mother obtained and published. In it he described in great detail midnight orgies, the celebration of the Black Mass by nude priests, the burning of pictures of the King and similar scenes. On cross-examination the boy's story broke down completely and it was found that he had cribbed most of it from old books on the Satanic cult. It is probable that the whole thing is the product of a perverted imagination. The girl who started the scandal about the home of orphan girls kept by Signora Capozzi at Rome has confessed that the story she told about her abuse was a fiction. The Government will propose a bill for the regular inspection of all institutions, lay or clerical, in which children or young people are taken. The Vatican will oppose this as an infringement of religious liberty.

The Situation in Morocco

General Drude, with 3,000 troops camped about a mile to the east of Casablanca, has successfully defended that city and withstood numerous fiery attacks by the tribesmen, greatly outnumbering his own force. A force of 500 Spanish troops under General Santa Olalla was landed at Casablanca to assist in policing the city, but dissensions arose between the two generals which for a time prevented efficient co-operation. The Pasha of Casablanca, who is held responsible for the massacre, is a prisoner on board the French cruiser "Gloire," Commander Lesquivet, the second ranking officer of the "Gloire," taking his place as Governor of the city. Order is restored and business is being transacted. The French are clearing up the city, which was left in a frightful condition after the bombardment. Dead and wounded were left for days about the streets and many died from starvation and disease. The houses are being searched for loot, which is brought to the market places to be sold at auction for the benefit of the sufferers. The city has been reduced to one-fifth its former population. The number of persons slain during the massacre and bombardment is estimated at 1,000, most of them Arab tribesmen who were killed by the shells from the warship. The financial loss probably amounts to more than $1,000,000. The French have begun the rebuilding of the minaret of the mosque which was destroyed in the bombardment. So far no other massacres have occurred in the ports, but French ships are patroling the coast continually. The foreign residents at Fez have so far been protected, but are afraid to leave the city for fear of precipitating a massacre. The Sultan is urging his people to maintain order, but it is questionable how far his

influence will prevail in the present crisis. In a council held in the palace at Fez between the viziers and the ulema, which is composed of the Moslem doctors of law, the Sheriff of Kitani denounced the Government for its concessions to foreigners and demanded the proclamation of a holy war against the infidels. The Kadi of Fez and four others of the ulema joined in the demand for a war of extermination. If the Sultan fails to put himself at the head of it he is likely to be deposed or assassinated. General Maclean is still in the hands of Raisuli, and has not been heard from for some days. It appears that he had been taken charge of by the Kmass tribesmen and would have been freed, but on hearing of the bombardment of Casablanca they were so enraged that they gave him back to Raisuli, who has secreted him in the territory of the Beni Aros.

Church Separation in Switzerland

The first to follow the example of France is the city of Calvin, and in Geneva the separation is now an accomplished fact. In this canton, where the immigration of Catholics had in recent years been assuming exceptional proportions, where several independent Protestant churches had already been formed and free thought had been gaining ground, only the Reformed State Church and the liberal National Catholic Church yet enjoyed the benefit of a cultus budget. Complete disestablishment had been advocated for a long time, and in the middle of June the Great Council of State, by a vote of 60 to 23, declared for the innovation, and now in a referendum the citizens by a vote of 7,656 to 6,822, or a majority of only 834, have definitely settled the matter. The weeks before the vote was taken were full of excitement, discussions in papers and pamphlets, public meetings pro and con, and even sermons in the pulpits adding to the agitation. The consistory had covered the town with large posters begging the people to vote against the separation scheme; seventeen pastors announced themselves for the measure and thirty pastors and professors plead for the *status quo*. Yet the lower classes, especially the working people, did not enthuse, and while 14,378 votes were cast, more than 10,000 voters remained at home.

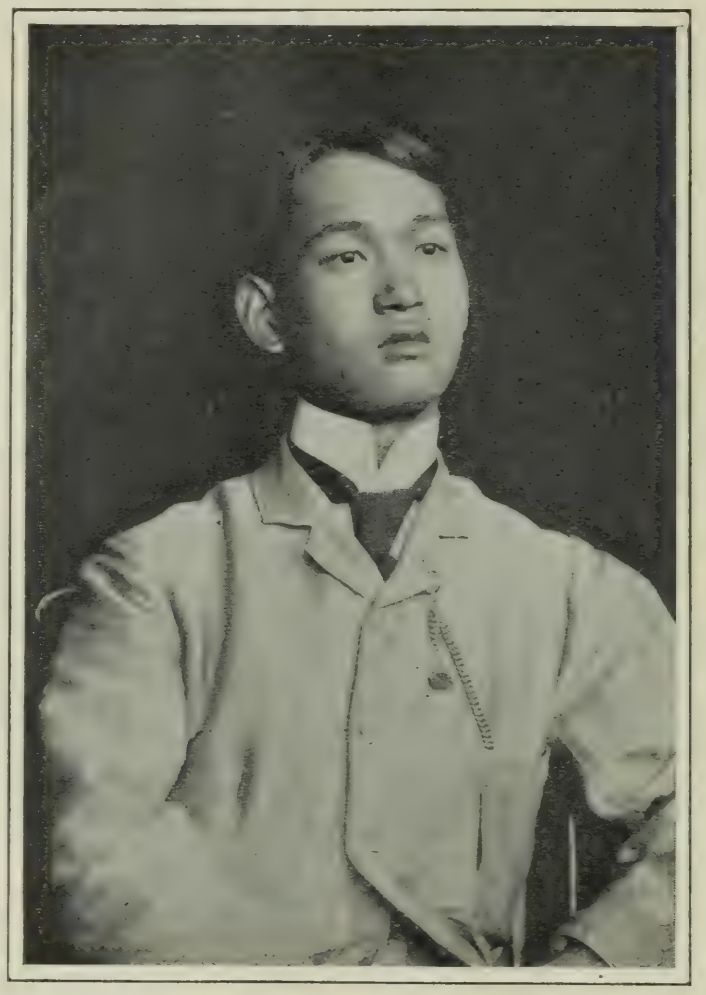
Foreign Notes

The Empress-Dowager of China, Tzi-hsu, has announced her intention of resigning her power into the hands of the Emperor at the Chinese New Year and retiring to private life. She is seventy-two years old and suffering from an incurable disease. A Grand Council has been called to make arrangements for the change. ——The bubonic plague has broken out in Southern Manchuria and sixteen deaths have been reported. Quarantine has been established at Kwang-ching-tse. Five cases of the plague, four of them fatal, have occurred in San Francisco among the poorer class of foreigners in the neighborhood of Chinatown. An infected steamer has been ordered into quarantine with all her passengers. It has been proved that rats are the chief agents in the spread of the disease, but there has been much discussion as to how the infection reached human beings. Dr. Simpson, of King's College, London, and other authorities hold that it is conveyed thru the contamination of food, but the commission appointed by the Indian Government has decided that the bacillus is carried by fleas, which bite first an infected rat and afterward man. The bacillus does not live long outside of a living host, man, animal or insect. In India the plague is more prevalent than ever before, causing a million deaths a year. ——Major Dreyfus has decided to withdraw his request to be retired from the army on account of not having been promoted to the lieutenant-colonelcy to which he might have attained if he had not been unjustly imprisoned on Devil's Island. Parliament will take up his case at the next session.——Russia is said to be in a very peaceful and orderly state now, yet according to the Government report 54 officers were killed and 47 wounded, and 95 men killed and 52 wounded during the month of July. During the same period 274 persons were exiled from St. Petersburg for political offenses. Recent assassinations include General Karakozoff, ex-Governor-General of Odessa, and Colonel Schrötter, commander of the Bialystok military station, who was supposed to be responsible for the massacre of the Jews there.

A Plea for Korea

BY PRINCE YE WE CHONG

[Prince Ye We-Chong is the son of Chin Pom Ye, who was Korean Minister to the United States, 1896-1900. The recently deposed Korean Emperor, Ye Hyeng, is his grand uncle. The Prince's name indicates his royal birth. We is his given name; Chong indicates his "generation name" and Ye is the imperial family name. He lived in Washington, D. C., for four years, attended the College of Janson de Lailly and for two years was a student at the special military school at St. Cyr in Paris. He has received the Russian order of St. Stanislaus from Tsar Nicholas II. He is married to a Russian lady and has a daughter; his family resides in Russia. His credentials were sent to him thru secret agents of his Emperor. For presenting himself at The Hague Peace Conference the Korean courts (at the command of the Japanese officials, so it is generally believed) passed sentence of death against Ye We-Chong and of life imprisonment against his colleagues, Ye Sang Sul and Ye Choon. The latter died of heart failure while at The Hague. We publish a facsimile and translation of the credentials which he bears to The Hague, signed by the Emperor's own hand and sealed with the imperial seal at the palace in Seoul, April 20, 1907. The Japanese have denied the existence or authenticity of this document and claim to have obtained a disavowal of it from the ex-Emperor.—EDITOR.]



AT the beginning of the Russo-Japan war, the Japanese Government announced that it had two main objects in view—the maintenance of the independence and territorial integrity of Korea, and the continuance of the "open door" for trade in the Far East. The Japanese publicists proclaimed, time after time, that Japan was not fighting for herself alone, but also for all civilization and for the commercial benefit of all trading nations. So every American and English merchant, missionary and other men in the Far East, fully expected that Japan would keep her words. In Korea, both the people and Government, placing full confidence in Japan's solemn promises—of the maintenance of independence and territorial integrity, made alliance with Japan. By virtue of this treaty the country was open to Japan as a basis of her military operations and the Korean Government and people assisted the Japanese in every possible manner in their struggle with Russia. We, the people of Korea, who had been tired of the corruption, exaction and cruel administration of the old Government, received the Japanese with sympathy and hope. We believed at that time that Japan, while dealing possibly stern measures against the corrupt officials, would give justice to the common people and would give honest advice in the administrative work. We believed that Japan would seize the occasion and lead the Koreans in their efforts to bring about the necessary reforms.

The Japanese were loud in their emphasis of the fact that they were in Korea, not alone for their own benefit, but as a nation doing the work of all civilized races, and securing the maintenance of the "open door" and of equal opportunity for all.

Then came the succession of remarkable Japanese victories and the tone of the statesmen and administrators altered. To our amazement and great resentment Japan has been and is playing the ugly, unjust, inhuman, selfish and brutal role instead of a fair and equal opportunities for all role.

The first demand, after Japanese wormed their way among us under the guise of friendship, with fair words and with solemn promises to maintain our

independence, was that all the waste lands of the country, which meant the greater part of Korea, should be handed over to a Japanese for a term of fifty years without any payment. This scheme, tho it failed to be carried out, helped to start a great revulsion of feeling among us against the Japanese. The next demand that Japan made was early in November, when Marquis Ito came to Seoul as special envoy from the Mikado. The entire Japanese forces, horse, foot and artillery, then around the city, were brought in front of the Palace and were maneuvered there for days until Marquis Ito had gained an audience with the Emperor, on November 15th, 1905, and presented the proposed treaty for his consent. There were four main provisions: The control and direction of the external affairs of Korea were to be handed over to Japan; the Korean Government was to pledge itself not to conclude any act or engagement of an international character except thru the medium of Japan; the establishment of Japan's residency in Seoul; and Japanese residents were to be appointed in any part of Korea where the Japanese thought necessary.

PRINCE YE.

The Emperor and his Ministers resolved not to give in; Ito persisted, whereupon the Emperor declared that he would rather die than agree. The negotiations with the Emperor and his Ministers were kept on until the evening of the 17th. Hour after hour the conference continued. Midnight struck, and still there was no agreement. The voices of the Japanese grew more threatening. "Yield or it means instant destruction to all," came the threat. The imaginations of the terror-stricken Ministers heard in every crackling bough around them the creeping of Japanese soldiers. As they entered the Palace that evening they had moved thru heavy lines of Japanese troops outside. Then one Minister, overcome by the persistence of the Japanese, began to weaken. The Japanese at once seized Han Kin Sul, then acting Prime Minister, and who was the most strongly determined not to yield, flung him into a room and kept him prisoner. Then the Japanese extracted their desire — a treaty by force from an unwilling government. Yet the Japanese publicists proclaimed to the world that the treaty was a glad and voluntary surrender on the part of Koreans. A hypocrite who picks a pocket while professing friendship and brotherliness is far more contemptible and brutal than an open robber.

The news of the signing of the treaty was received with consternation by the Koreans. The people arose; the Japanese swords and guns quieted them down. Since November 17th, 1905, Japanese, with force and arms, have taken away everything from the hands of Koreans. Japanese have taken over the entire machinery of the Government of our country and are using it solely and directly for the financial profit of the Japanese people. They are officially and unoffi-

大韓光武十一年四月二十日於漢陽京城慶運宮親署押鈐寶

大皇帝

[TRANSLATION.]

His Majesty the Emperor of Korea, to whom it may concern:

As the independence of Korea has been known to all the Powers with which she has ever been in friendly relation, we have, for this reason, the right to send delegates to all international conferences which can be convoked for any purpose. But by the terms of the treaty of November 18th, 1905, which was extorted from us by force, the Japanese by menace and by a violation of all international equity deprived us of the right of direct communication with the friendly Powers.

Not recognizing this act on the part of Japanese, we desire hereby to appoint the official of the second rank, Ye Sang Sul, and Ye Choon, ex-Judge of the Supreme Court of Korea, and Prince Ye We Chong, former Secretary of Legation at St. Petersburg, as Delegates Extraordinary and Plenipotentiary to the International Peace Conference at The Hague, for the purpose of making clear to the representatives of the Powers the violation of our rights by the Japanese and the dangers which presently threaten our country; and also to re-establish between my country and the foreign Powers the direct diplomatic relations to which we are entitled by the fact of our independence.

Considering the three gentlemen above named to be men of high ability and of proved fidelity, we appoint them as our full representatives to the conference at The Hague, in the conviction that they will faithfully serve us and the interests of the nation.

Done at the Palace of Kyung-Oun, in Seoul, this 20th day of the fourth month in the eleventh year of Kwang-Mou.

YE HYENG.

cially pushing forward schemes of extortion, robbery and cruelty, which in three years have inflicted more actual damage than the worst government of the old style could have done in fifty years. In the recent issue of Ito's pamphlet, he asserts he succeeded in raising a loan from the Japan Industrial Bank of 10,000,000 yen ($5,000,000). The money realized was distributed in the reconstruction of roads, in building water works, establishing an educational system, etc. It sounds mighty well and good enough to deceive those who are ignorant of the situation in Korea, but that statement of Ito is a hollow mockery to those who witness the brutal and selfish Japanese actions in Korea.

It is true that Ito succeeded in borrowing 10,000,000 yen from Japan, but to say that the money was spent for the benefit of Koreans is a deliberate lie. The finances were taken over by Japanese and have been shamelessly exploited for the peculiar benefit of the Japanese.

Hundreds of Japanese subjects have been engaged at salaries often three or four times as much as they would be given in their own country. Thus a very large part of the 10,000,000 yen are consumed in that way. At the same time these Japanese, who are living at the expense of Koreans, do the work for Japan and not for Koreans. The so-called water works are provided only for the Japanese towns of Chemulpo and Seoul. Almost every week there come stories of the engagement of Japanese experts at high salaries, the granting of premiums to Japanese officials, the enlistment of additional Japanese policemen and so on.

Japan professes to have established an educational system, but that system is not to educate the Koreans with science or art, but to exterminate the Korean language and substitute Japanese. The whole country is against this system. The Japanese do not allow the Korean young men to go abroad for their education, under the pretense that when the Koreans go abroad they would preach anti-Japanese doctrine instead of engaging in study.

Japan professes that she has reformed the administrative systems, but what they have done is no more than that of driving out the reliable Korean statesmen and put the Japanized Koreans in all the Government offices, Japanese authorities have taken away not only the Government buildings and offices, but also taken an immense area of private lands without proper compensation under the pretence of "military necessity." Thus, thousands of families are dispossessed of their property and brought to ruin. The so-called reform of the currency has been tried and is so chaotic that it has produced no other effect than bankrupting thousands of Korean merchants. Yet Japanese publicists and statesmen maintain that whatever they do is good for the Koreans. Most of the Japanese coolies who are going over to Korea are paupers. With these coolies they take the property of Koreans without paying any value, but the Resident-General has done nothing to prevent them from committing such brutal actions.

The Japanese say, peace! peace! but can a person be peaceful at the mouth of machine guns? There can not be any peace in the Far East until the Koreans are all killed or they acquire the independence and freedom of Korea.

The Koreans are not organized but already united in spirit for one object, which is to resist the Japanese brutal, inhuman and selfish aggression to the bitterest end. It will prove to be not a pleasant or easy job for Japan to butcher 20,000,000 Koreans who are determined to fight her in whatever way they can. Already and in reality Japan has violated her solemn promises about the "open door" as much as about Korean independence.

NEW YORK CITY.

A Clergyman's Opinion of Women

[The writer of this article is a clergyman whose name is well known not only thruout his own denomination, but far beyond its bounds as well. He has served for several years each four important congregations. After a perusal of these pages it will not be difficult to realize why he withholds his name. This year's deficit in the Post Office Department is rather large so we will add that we shall be glad to hear from any of our feminine readers who feel moved to talk back. If the replies are sufficiently logical to refute his view, or characteristically illogical enough to confirm it, we may publish some of them.—EDITOR.]

THEY who would view women as a clergyman sees them must look thru bi-focal glasses. They must see them, as the preacher himself does, now near at hand from the pulpit in the pews in church on Sundays at their worship, and again, farther away, from his position as organizer and administrator of activities in schools, societies, committees, guilds, associations, etc., doing the work of the church on weekdays. I bid you therefore in imagination put on such divided spectacles and look at them with me. I warn you, however, that you will not understand what you see; for that vitalized interrogation point which is the emblem of a woman in all other realms is as fit emblem of her here also.

If, for example, you can understand or can explain a woman's mental processes in listening to sermons, her course of reasoning in arriving at conclusions, her demands and expectations in matters of sympathy or her likes and dislikes in things personal; if you can estimate her inability to pass judgments upon other than sentimental grounds or can understand her explanations and confessions when she makes them; if you can tell why she does certain things and does not do others; what is the groundwork of her will, and, incidentally, of her won't; why she thinks she thinks when she knows she only feels and believes she can rule by reason when she herself is ruled only by instinct; why she puts off deciding a matter as long as she can and then decides as suddenly upon impulse as she had hesitated long out of caution; why in her thinking she never grasps a general principle, but always begins with details and in her doing does the very opposite; why she will never "stay put," but when you think she is persuaded and convinced and says I will, goes away and won't, or says I won't, then straightway goes and does it; if you can explain why she resigns a position when she most wants to keep it, and as steadfastly adheres to a committee when she wants to leave it; why in her pride she apes humility and in her modesty is seldom meek; why when angry she will laugh in your face and when glad will as certainly weep; why in argumentative discourse she will not meet a fact point blank, face on, and by the rules of warfare, but charges past, turns in a circle, and attacks it from the rear; why the best way to get her to assume a position or champion a cause is violently to oppose and denounce it yourself; why she is offended when you agree with her and bears reproof and reproach with smiling approval in voice and countenance; why, when she is most possessed by enthusiasm, she is also possessed of such imagination as enables her to see insults where none had been intended and to take offense where there

has been no slightest cause; why her tastes are so paradoxical that it would require every man to have tenfold the adaptability of the chameleon to be in succession each of all her various and contradictory ideals; and why, to crown these all, she is so often self-consciously unconscious that all clergymen are conscious of her faults and foibles; if you can do this, or any of these, you can do what I cannot. I have long ago given it up. And therein alone lies some peace of mind.

A woman's mental processes? Nothing so well prefaces the discussion of this first phase of this subject as that well-known treatment in a college essay of the subject "Snakes in Ireland: There aren't any." At least, if there ever were they have suffered accident, have been disjointed, and in being rearranged have been laid, not in a straight line, nor yet in a circle, but in a triangle. Certainly I always see them in this figure in imagination. Would you prove it? Start discussion. She will dart off, with you in pursuit. Come to a point. She turns, not back upon her course however, but at an angle, and that an oblique one. Follow that line to another point and again she turns. You still pursue; when, lo! you reach the starting point—whence she is gone again.

It is only the young man and immature who ever tries reasoning here by reasonable methods. The one of more maturity has learned that this is but a dance of death; he pursues not; he stands and waits. It would take the space of a three-hour comedy each to fill in all the details of illustrative interviews here of which on the pages of my diary for the past month alone I find six suggestive memoranda. One is a woman who wants the Psalter sung instead of read, because the Psalter is so beautiful, and, besides she could never stand those old Hebrew psalms anyway; another, the woman who gave to the church a stained-glass window in memory of her father, because she was so devoted to her aunt, and—and that's why she never comes to church; a third, a woman who was treasurer of one society and wanted to resign, in order to become secretary of another, because she was going to Europe for a year; a fourth, one who wished I could get her brother interested in this church, the brother living a thousand miles away, and the reason being that her son is about to be married; another, the woman who resigned one paying position in order to accept another which paid a larger salary, and, altho I literally coaxed her not to, became my enemy for life in the belief that I had told her to do it; and the last, one who was anxious to become my stenographer, who had large experience, and was sure she could fill every requirement—except that she lived in a suburban town twelve miles away and could not leave an invalid mother for more than an hour at a time.

All this takes no account of the vague woman, the one who presents a series of data, but with studied care leaves out the most important fact. Of this group here in one week alone are five illustrations from letters: One wrote for a baptismal certificate of eighteen years ago, but forgot to give the name of the child; a second, a total stranger, wanted to establish a marriage record for the purpose of pressing a pension claim, but did not append her address; another invites me to dinner, but does not name the hour; a fourth wishes me to telephone her, but gives no number to call; another asks me to address a society with an imposing name, but does not say where the meeting is held; while the last one is an instance of many; the signature has two initials, but I do not know whether to direct the reply to Mrs. or Miss—and a mistake either way would be fatal.

To build on such facts a philosophy, to rise from these particulars to something general and apart from mere phenomena, to search for reasons, why does a woman think after this fashion? Has she any special mental trait? I can think of one, or rather of the absence of one; that is, of the part that her memory plays, which is to say the part it does not play. A man is wont to hold facts in his mind in groups; a woman occupies her attention at one time only with one. Her perspicacity is, maybe, clearer and her insight deeper at the time and place; but just what will come next no mere man can even guess. She thinks of one thing at one time; but after that point is past by, a second comes regardless of relationship, and the first is relegated to a

limbo of its own. Of course this is the death of logic. But who ever said that she was logical?

Nor may this trait be considered a sign of feeble-mindedness. In fact, it has nothing to do with either mental strength or weakness. There is no question involved of quantity, but only of quality of mentality. If she fails to follow my scheme when I outline it, it is not because she is stupid, nor I; it is merely because we do not think by the same process. If she fails to act upon a new suggestion and falls back upon an old tradition, it is not because she is contrary; it is merely because she does not understand. If I announce an offering on Sunday, speak ten minutes about it and take the collection on the spot, I am not surprised when I meet her on the street a week later to be asked when it is to be taken. This does not mean that she is penurious; it simply means she has forgotten. If, on the other hand, I forecast it a month ahead and find her money with her card on the plate the same day, I merely know she was not listening. She was looking at me while I talked, and I had thought she thought; but she was thinking about something else. Naturally, this is a most serious hindrance in preaching; but one must make his best of it—and she her best. If a woman takes offense at some special discourse, it is never at the preacher's argument in toto, nor yet at premises nor at conclusions; it is at some single fact or illustration. If she stops and dwells on this and criticises it apart from its connection, it is not because she means to; it is merely because her mind has gone off on a tangent.

But it was her memory we were discussing. And a lapse here sometimes serves as great advantage as the foregoing was a disadvantage. For she forgets not only the things you wish she would remember, but with equal ease at times the things you are glad to have her forget. A woman does not ordinarily "hold spite" in the way a man does. She forgets what it was she was angry about, or, still more often, she forgets that she was angry when she meets again the person at whom she was offended. I have had some great surprises here. A woman left my study one day in a dreadful huff; the next day she invited me to dinner. One was going to give up her pew on the spot; she has not missed a service since. One came to me with a frightful quarrel on hand to settle. She was angry with another woman. When I called next day to talk it over they were out driving in the park together.

This naturally raises the whole subject of the size of things that women take offense at, or, again, their lack of size, their pettiness. I am concerned here only with things that affect me—not their neighbors or their husbands—and that alone in my relation as pastor. Chief among these is my failure to call on some one when that one is sick. I would be glad to if I knew it, but I seldom know. The doctor called? Yes. But perhaps he was sent for. A clergyman is no more nearly omniscient than a doctor, and being without this attribute he, like him, has no way of knowing things except by being told. The next most favorite field of offense, however, is that of definite invitations given. There was one woman who in this connection almost drove me to distraction. I did not want to be rude, for I know that she meant to be kind; but the functions to which she invited me were these: first, a dance, where I did not belong; second, a bridge whist party, altho I could not play; third, a dinner on Saturday night (I had two sermons to prepare); and, lastly, a vaudeville entertainment on a day I had a funeral. Nor is the mere fact, even when it is a fact, as in a busy season it is possible to be, of a previous engagement, any explanation. There was one women last winter who four times invited me by telephone to dinner, in no case four hours beforehand. When each time I said I could not go, what comment more natural to expect than: "Oh, you do not want to come."

The points for consideration in this contra-lateral field fall so thick and fast and are themselves so contradictory that it is difficult to arrange them in a straight line. But next in importance, perhaps, after feeble memory, as an explanation of such instability in thought, comes woman's instability of mood as explanation of strange action. The most difficult thing in trying to influence any woman's conduct, whether by pulpit exhortation,

study consultation or fireside counsel and advice, is to get her to stay in the mood induced. Over and over again have I felt quite sure that I had solved some problem for some poor, perplexed parishioner, only to find that next day her whole mental clockwork had slipped back as many cogs as had been wound the day before, and the hands on the dial pointed to a wholly different mood.

Why will she agree with your course of reasoning to the last detail in theory and go straightway and follow the very opposite course in practise? Why, when you have her consent to aid in some venture today, will you meet with her flat declination tomorrow? Why will she come with some problem you see the solution of suddenly, go away satisfied that you are right, and then proceed as tho you had been wrong? Why will she resign an office, decline to consider it over, aver she could not be induced to return, and then take real offense at another's appointment? Why will she walk round a point in a circle, look at it on all sides, and then never seem to have have seen it at all? Is it because that, when left to herself, her instinct is a better monitor than was your argument? Maybe so. Is it because her "because" was a better reason than your reasoning had been? Quite possibly. Or is it, most of all, because by nature she cannot deal in finalities, that in her calculations nothing is ever finally settled, that what looks most so is least so; in other words, that she merely employs that eternally feminine practice of saying "no" vociferously when she most means "yes."

Or, am I possibly still wrong in all these guesses? Is the more simple reason, perhaps, the more real one, that her vagaries of thought and of conduct are oftenest due to ill health? There are many degrees of madness which are designated only queerness, and of all of these one feature is unreasonableness. Who shall say what is, or how close is, the relation between states of mind and conditions of body and how great excuse the one finds in the other? Moreover, who shall find fault with unreasonableness at all? There is a law beyond reason and it is a law of its own; it is a very law of lawlessness; such lawlessness is its own law. It has its statutes and its processes and penalties. The most foolish thing any woman can do is to try to ignore this law, to try to be unwomanly. Not only is this effort always futile, but when made in earnest it is ludicrous. Scratch a Russian, you will find a Tartar; follow Queen Mary's advice and you will find Cathay. So surely is there in every woman that which is essentially feminine, and foolhardy is she who persists in ignoring this. This so-called "business woman" is an anomaly; the woman who "mingles in politics" is a monstrosity; the woman who boasts of her cleverness in doing "men's work" is an absurdity; the woman whose conceit is in her masculinity errs in vision and stumbles in judgment. It were hard to decide which were the more worthy object of scorn, the woman who would do a man's work or the man who is effeminate, the Amazon or the Miss Nancy.

And this raises a point in passing. To the question, how to equalize the sexes, the answer is not in terms of equality at all, but in terms of difference. The very things for the doing of which the most manly men are conspicuously unfit are those for which women are by nature and taste the most eminently fitted. This difference ought to be emphasized and not obliterated. To try to make men and women as nearly alike as possible, to give them the same education and set them the same tasks, to measure them by the same standards and pay them in the same coin is utter folly and sheer nonsense. Rather deepen the differences between them, train them in different ways for different tasks, offer them different rewards for success and punish their failure with different penalties.

A man may be great because he is strong, and rich because he is reckless; a woman is great because she is good, rather than consistent, and lovable because she is lovely, rather than persistent. When she is successful it is because her dreams have happened to become her duties. Possibly "a woman is not a rational being"; but possibly also no one ever meant her to be or wanted her to be. While one thing at least is certain, men do not want women to be like themselves; they want them to be as different as possible. And in the long run what they want her to be she will be,

just as surely as what she believes them to be they will strive to prove worthy to become.

There are a half-dozen things which by the text-book methods are fairly clearly cataloged in the world's opinion as traits of feminine character. It would be ungallant to give an *obiter dictum* opinion here as to whether they really are or not. I tabulate them, therefore, rather in the form of questions. Is there any truth in the theory that a woman's curiosity is greater than a man's? Has she any propensity for gossip as such? Is she cruel, or, to quote a writer of her sex, is there "in every one of us some of the traits of that feline creature, to spell whose name, with three letters, is one of the earliest tasks of the child with his primer"? Does she delight just a little in mystery? In other words, is she more likely to speculate over the faults of her sister than to tell her confessor her own? Will she tell her pastor in detail of the sorrows and griefs that beset her neighbor, whom she wishes he would try to help, while leaving him to guess her own, and then blame him for lack of sympathy? In other words, has she gotten quite as far away as her husband or her brother from those childhood days in which their favorite game was "Secrets"?

Now all this leads up to a splendid opportunity to give advice; too good a chance by far to throw away. If one would make less frequently the most grievous mistakes she ever makes in dealing with the clergy, avoid the very pitfalls that her nature holds wide open and comport herself so that her pastor may have cause to call her blessed, let her hearken to this list of Don'ts. Don't be any more vague in your speaking and hearing than you can possibly help, nor any more unreasonable in your thinking and acting than you have actual reason to be. Don't use your memory mainly to forget with; if you write him a letter which contains a request, don't leave out any important fact if you can remember to put it in. Don't ask his advice at all unless you mean at least to try to take it. Don't burden him by telling him your tragedy unless you are willing to tell the whole of it and thereby help him to help you. Especially don't tell him other people's troubles; he probably knows them better than you do already. Don't revel in mystery; if there is anything he ought to know about you, tell him, else don't blame him for being hard-hearted and unsympathetic. Don't pry too deeply into other people's lives, not even into his; this, when all disguise is taken off, and all things are called by their right names, is nothing else than curiosity. Above all, don't get the "confessing habit." Women do not make good confessors. Any sense of sin, whether imaginary or real, makes them unreal. Few women can weep tears, however penitential, without glancing in the mirror of their own self-consciousness to see how their garment of sackcloth becomes them. Don't lose your temper; you may not find it again. And don't waste it on your pastor; he has enough already. Keep it for your husband or the gasman or the cook. On the other hand, don't go to the other extreme and flatter him too much. Most clergymen are so well used to this that it has small effect even for evil; but none of them is quite beyond the possibility of being spoiled. Don't be ruled in your judgments too largely by personal considerations, by appearance or dress or accent or gesture or any of those minor things which all too often are the weighty ones in the "call" of a new pastor or the passing in review of "candidates." Don't believe that one is a Saint John solely because he looks the part, and don't decide conversely that another is a "naughty person" merely by the Wise Man's ironical test that he "winketh with his eyes, he talketh with his feet, he teacheth with his fingers." While, even later than the last, and as appendix to the whole series, don't think that this article is flippant; it is meant to be serious. And don't be offended at some one point or particle of it. Please take it as a whole and know that it is laudatory.

I have heard that it is the last thing a woman hears which she acts on first, the last point in an argument that stays in her mind, the latest impression that most molds her manner. Therefore, in this series, let the last injunction be this: Have some consideration for your pastor as a busy man; for, if he is anything worth while, he is a busy man. There

are those, scornful ones, mostly men, to be sure, who think of him professionally as an idler, as a non-producer; there are those others, mostly women, who think of him as working only on Sundays and at their service at all hours of other days.

They forget that sermons do not grow on trees; that they must be planted, watered, gardened, tended, pruned and prepared, as well as taken to market; and that this means time — much time. They forget also that his duties are manifold, that what each expects individually of him he must multiply by the hundred or the thousand people who are of the same congregation and expect the same attention to estimate the total of his task.

When men enter this profession they are wont to dream of long uninterrupted days for study, meditation, composition and the pursuit of their own desires, possibly even of a "Monday off" each week. Does such a one think of these dreams in after years some morning as he takes up his diary to note the special duties for the day? I cite my own poor little case. This morning is Thursday. Half of the week is gone. That entire half has been taken up with half-day tasks of an extraneous nature—two funerals, one conference, a wedding, a luncheon and a trip out of the city for a lecture on Tuesday night (one of a dozen such this season alone, for no single one of which was there any fee). The result is I find my entire week's work, so far as it involves study, still ahead of me. This means two sermons for next Sunday, a weekly lecture for tomorrow night, a course of Sunday-school teachers' instruction Saturday forenoon and a special paper to be read next week at the Blue Monday Club. But before even thinking of any of these, I must examine my morning's mail. It contains twelve letters. The first I open is from the editor, pressing me to my promise to have these pages in the printer's hands today.

The Vision of a Pure Heart

BY HENRY STILES BRADLEY

O Thou, who art so intimately near
To all Thy children, that to call Thee "near"
Makes Thee remote. Forgiveness now I crave
For dullness which has ever failed to feel
Thy presence; mercy show, for with dim eyes
I have thru interstellar spaces sought
For Thee, and, failing in my stupid quest,
In disappointment, said that Thou art not.

Teach me that Thou art not with human eye
Discerned, but that the heart of purity
Like Thine, assurance of Thy presence knows,
Nor dreads, nor doubts, nor needs completer test.

As when a singer's vibrant voice is caught
Upon the strings of instrument attuned
And echoed in a tone melodious.
May Thy pure nature and Thy loving will
Be welcomed by my sympathetic soul
As heavenly measures, evermore to stir
My chords of being into harmony.

Help me to drive forth from my secret heart
All subtile motives that would basely blend
With selfish schemes for any lesser good;
With single eye for the supremely best,
To make my life transparently sincere—
A lake of purest purpose to reflect
Eternal Person—Father-Spirit—God.

St. Louis, Mo.

The Effects Produced by Drugs

BY THOMAS F. REILLY, M.S., M.D.

PROFESSOR OF APPLIED THERAPEUTICS IN FORDHAM UNIVERSITY

DRUGS are substances used to counteract the effects of disease or to reinforce the tissues in their struggles to maintain their functions, when these are rendered abnormal. Some of them act on the organism only thru their physical properties, as when a simple oil or powder is applied to a raw surface and promotes healing by protecting it from irritation.

The great majority of drugs act thru their chemical affinity for certain forms of living matter. They form temporary chemical combinations with some forms of protoplasm and change the function of all cells which contain these forms. Just how drugs act was practically unknown until Schmeideberg, forty years ago, first approached the subject from a scientific standpoint. He was the first to put animal experimentation on a firm basis. Since then it has become the rule thoroly to test drugs on animals before they are given to human beings. This involves the most painstaking care and research, and much time and labor are spent in investigating all of the new drugs as well as many of the older agents of the materia medica. After the chemical actions and reactions, formulas and antidotes have been worked out, the new agent is ready for animal experimentation. First the animal is anesthetized or put to sleep and the drug administered. Aside from any humane reasons it is a *sine qua non* that this be done, because the influence of pain or suffering on the nervous system of any animal renders the physiological action of almost any agent valueless. In no first-class pharmacological laboratory is an animal subjected to torture, as anti-vivisectionists would have people believe. Half-baked experimenters might perhaps do so, but in no reputable institution would it be permitted. Careful tracings are made of the pulse and the effects of the drug on all of the functions of the body are studied. After hundreds of like experiments, with a view of determining accurately the poisonous as well as the therapeutic dose per pound weight of the animal, it is given into the hands of the clinicians attending large hospitals and there tried on those hitherto unsuccessful cases which, judging from the physiological action of the drug, would seem to need just such an agent. In this way many thousands of new agents have been introduced, mostly in Germany, within the past decade. Most of them have proved valueless, but so many good and indispensable drugs have survived the careful scrutiny and disputation of competent observers that it has made the treatment of symptoms as well as of disease far easier than it was before.

The action of some drugs is direct, while that of others is indirect; for instance, mustard or sulphate of zinc, common emetics, produce vomiting by their direct irritating effect on the walls of the stomach, whereas apomorphine injected under the skin is carried thru the blood to the vomiting center in the brain, and from there the message is sent out to produce vomiting, and this usually occurs within a few minutes after the injection.

Within the scope of this paper it is impossible briefly to more than outline the major actions of a few of the more commonly employed agents, and I shall only attempt to point out the general principles of drug action. If all drugs acted the same way in all individuals their administration would be an easy matter, but in from 5 to 10 per cent. of our patients there occurs an entirely different effect from that ordinarily observed. In some people morphine, instead of producing sleep, will induce violent delirium, and there are many other like idiosyncrasies. It is true that physicians can often tell when to fear these extraordinary effects, but this is not always the case. Light-complexioned people stand belladonna badly, while children relatively can take more arsenic than adults, and so

on. Some drugs have a manifold action, that is they affect various organs differently. Belladonna, or atropin, its active principle, which practically amounts to the same thing, is a good example of this action. In the first place, it checks secretion all over the body. It dries up discharges from all mucus membranes, but affects those of the nose and throat more than the other mucus surfaces. Hence its widespread and successful use in the early stages of catarrhal colds in the nose. Second, it relaxes spasm, and by so doing relieves pain; this is particularly so in the lining of the bowels and bladder. Hence it is indispensable in painful conditions of these organs; administered with purgatives it prevents griping, etc. Third, it dilates the pupil, makes examination of the eye a possibility and saves the eye from pain and destruction in iritis. Fourth, it indirectly stimulates the heart and respiration, in the latter instance doing just the reverse of morphine. For this reason it is an almost perfect antidote; the morphine kills by slowing the respiration and also causes the pupil to contract to a pin point.

Many fallacies as to the action of drugs are continually met with. There is probably no drug that has a wider popular use among the laity than quinine. All ailments and fevers are treated by it, and almost every one who contracts a cold takes as much as he or she can stand; yet, with the exception of true malàrial fever, a by no means common disease in Northern latitudes, it has very little value. It is true that in small doses it acts as a mild tonic for the nervous system, and that large doses do reduce fever for a short time, but it has not any specific effect on any disease other than true malarial fever.

Large doses in some individuals produce ringing in the ears, dizziness, rashes of various kinds, delirium and vomiting. These effects, like those of all drugs, are only transitory and soon pass off, but are often very disagreeable while they last.

Few people are apt to think of tea or coffee as a drug, yet a cup of tea or a cup of coffee contains three grains of caffeine, a drug acting markedly on the heart, kidneys and nervous system. The central nervous system, particularly the part associated with the psychical functions, is strongly stimulated, the ideas become clearer, fatigue and drowsiness disappear and thoughts often flow clearer. The capacity for physical exertion is generally augmented, and this has been thoroly demonstrated in the late Russo-Japanese war. Kraeplin, who has investigated the subject from a psychological point, finds that tea and coffee facilitate the reception of sensory impressions and also the association of ideas, especially in fatigue, but the transformation of conceptions into actual movements is retarded. The effect on the acuteness of the senses has been demonstrated by the greater accuracy of touch under its influence. It increases the force and the number of the heart beats and increases the flow of urine. Some are particularly susceptible to the effects of caffeine. Large doses will produce effects in most people; these consist of wakefulness, palpitation and irregularity of the heart, muscular twitching and other evidences of a disturbed nervous system. Digestive disorders are common in habitual users of these agents. Some of these digestive troubles are aggravated by the other bodies present, such as tannic acid, volatile oils, etc. Cream and milk generally taken with coffee and tea are responsible for a large part of these digestive disturbances.

The reason we do not notice these effects ordinarily is that our system has become accustomed to the drug and no appreciable effect is produced by ordinary doses. The results of excessive use of this agent are only transitory and pass off on its discontinuance.

Cocoa, the active principle of which chemically is closely related to tea or coffee, possesses few of these stimulating effects on the nervous system, altho it affects the heart and kidneys much the same as tea or coffee. The digestive tract is less often affected by it than by either tea or coffee. Caffeine, like alcohol, seems to be distributed the world over. In South America quantities are consumed in the form of maté of Paraguay tea. In South Africa the kola nut supplies the natives with this agent; while a species of ilex found in Virginia

and Carolina furnishes the Appalache tea or youpon, formerly much employed by the negroes of the South for its stimulating effects. Cocaine bears no relationship to cocoa, as it is derived from an entirely different plant. It, like caffeine, stimulates the brain and the ideas flow clearer, the patient becomes talkative, there is considerable mental exhilaration and the power to perform muscular exertion is very much increased. The natives of Peru and Bolivia have used it in the form of coca leaves for centuries to increase their power of endurance and resistance to fatigue. It likewise stimulates the heart and urinary flow. All of these effects are but transitory, and within an hour or so a corresponding depression sets in; so much so that it is often necessary for the subject to go to bed, and he is far more gloomy than before. Of course it is never administered for these stimulating effects, but is used almost entirely because of its power to temporarily paralyze the sensitive nerves, particularly those conveying impressions of pain and touch. This has revolutionized surgery and made it possible to perform all minor and many major operations painlessly. It acts as a block in the nerve, preventing any impressions going to the brain, much as a piece of glass or rubber would block a telegraph wire. On account of its widespread use in dentistry, affections of the eye, hay fever and the like during the past few years a great number of people have contracted the cocaine habit. This habit is far worse than the morphine habit, and is more easily acquired. It more quickly undermines the victim's health and strength. He loses appetite and suffers other digestive disturbances, followed by emaciation or gradual wasting. Sleeplessness and tremors are generally present, and in many cases the insane asylum is the terminus. Cocaine should never be used without direct supervision of a physician, as occasionally, even in small doses, it is a very dangerous drug and its habit-forming effects are more insidious than any other drug.

Opium, or its chief constituent, morphine, is without doubt the greatest and most useful single drug that we possess. When given in small doses it produces a dreamy, restful feeling, quiets the heart, relieves all pain, if there be any, and finally induces sleep. Its action is on the brain itself, and all of the messages sent out from that central office are affected by it. If the dose be very great, which seldom happens, the pupils of the eyes are contracted almost to a pin point, the number of respirations slowly but surely diminish to one or two per minute, and finally death supervenes. In most people on the day following the administration of a moderate dose there is some nausea and vomiting, together with constipation, and frequently itching of the skin is complained of. As has been stated, in a few people delirium occurs instead of sleep, and the drug cannot be tolerated. Because of these untoward effects, and because of the frequency with which the morphine habit is formed, physicians as a rule strive to substitute some other agent for morphine and resort to it only when nothing else will do. It is very rare for it to fail to relieve pain, and, after all, that is the first duty of the physician to our fellow men. The habit is formed usually in people possessing little of what is generally termed will power; they are the same people who easily take up the alcohol habit or any other addiction. In such people, suffering from any long-continued painful illness, the habit is easily formed, and is seldom or never broken. The continuous use of soothing syrups, paregoric, etc., in early childhood seems to prepare a fit soil for the opium habit in later life if the occasion presents itself.

Many of the newer remedies relieve pain and induce sleep with few evil effects. About two decades ago it was accidentally discovered that some of the derivatives of coal tar possess pain-relieving properties. The first one of these had scarcely been placed on the market in the form of antipyrin before the Western world was in the throes of the first grip epidemic. This agent, crude as it was, afforded almost complete relief from the pains of that most distressing malady. Every one knows how long that disease has lasted, and in its train hundreds of thousands of morphine habitués would certainly have followed but for the discovery of these agents of the coal tar series. After the chemists discovered that the aniline ring

(coal tar) of organic chemistry was the basis of an endless chain of therapeutic agents, they set to work substituting different organic bodies in the ring, continually improving on the previous one, so that hardly a week passes but that one or more new candidates derived from the coal tar series are offered for trial to the profession. Sleep-producing drugs are, like these pain-relieving agents, also derived from the coal tar products, so that whereas for the relief of pain and production of sleep formerly the only drug of value was morphine, now we can generally substitute these safer agents. These synthetic compounds are not without some drawbacks; for instance, occasionally antipyrin produces an extensive rash. Large doses of antipyrin as well as acetanilid produce in some people a depression of the heart, evidenced by attacks of faintness, difficulty in breathing, palpitation and blueness of the skin, which attacks occasionally result fatally. In rare instances drug habits have been formed. The latter derivatives of these basic bodies have less and less of these evil effects, and we hope soon to be able to get rid of them entirely. The science of pharmacology is entirely new, and the wonderful achievements of the last two decades make it certain that it will produce yet more wonderful results in the future.

The great increase in the number of physical and electrical methods of treatment of disease during the past decade would naturally lead one to suppose that faith in the therapeutic results of drugs would be on the wane. Yet it is safe to say that never before in the history of the race has the laity had greater confidence in the use of medicinal agents. The value of druggists' preparations, not including prescriptions, increased from $6,659,797 in 1890 to $23,192,789 in 1900, or nearly 300 per cent., while the increase in population for the same period was only 22 per cent. In 1895 the importation of cinchona bark, from which quinine is procured, was 2,699,730 pounds; in 1905 it was 4,251,169. The increased exportation of drugs from this country is almost proportionate to the above figures, thus showing that this faith in therapeutics is not limited to this country. That drugs do produce effects goes without saying. That these effects are beneficial when properly watched and gaged, our senses as well as scientific instruments attest; but the blind faith of the laity in a drug, simply because the label on the bottle says it is good for a dozen or more diseases, passes all comprehension. With two or three exceptions, drugs do not of themselves cure disease, but they make the cure of disease possible.

FORDHAM, N. Y.

Nirvana

BY ARTHUR B. RHINOW

O BEAUTIFUL land of Nirvana,
O land of the purest bliss,
Where all of our joys and sorrows
Are sunk in the Lethe abyss;
O land without briar and blossom,
O land without smile or frown,
O land without keen disappointment,
O land without crosses or crown,
O land without hatred and envy,
And land without passion and love,
O land without failing and falling,
And land without help from above;
To me you are bare of attraction,
Thou land without death or life;
And until I am called to God's heaven
I'll stay with my boy and my wife.

CINCINNATI, OHIO.

Vacation in the Leather-Stocking Country

BY SYDNEY REID

[The centennial celebration at Cooperstown, N. Y., last week gives additional point to this wholesome holiday experience.—EDITOR.]

THE little train puffed on and left me standing alone on the little platform. No station agent or baggageman was in sight; not a soul except a man in blue jeans, who had his back turned toward me and seemed to be hurrying away.

Where was the bus? Where were my people? Hadn't they got my letter?

I whistled at the retreating man, but time had worked its effects on my whistle and it didn't carry far; the man disappeared around the corner of a shed. But I was not disheartened. I was from the city, true enough, but still I was a biped, and by putting one foot before the other I could reach the village, and I could carry my bag also, and when I was tired the bag would serve me for a seat—good idea!

I picked up the bag, and as I raised my head again there stood two Little People in front of me. One of them belonged to me, and the other I knew well.

"Where were you?" They asked shamelessly, as tho the question should not rather have been "Where were they?"

"Where is the bus?" I asked.

"It'll be here in a minute," said they, and so it proved. The man in blue jeans was the driver, and he brought the bus round from behind the shed. And we all got in and rode down, down, always down hill toward the sunset, along a road that meandered as if going nowhere in particular, and certainly was in no hurry.

And I, also, was in no hurry. The Fountain of Perpetual Youth did not flow with water, but with air. I knew I had found it and was breathing deep, it was so good.

My mind was at ease. The Fairy Queen had not come to meet me, because the Youngest Fairy, who is corpulent and very enterprising, had got himself in some sort of a scrape that alarmed her, so that she suddenly picked him up, and, in doing so, gave her side a wrench, but nothing to count.

I enjoyed the scenes while the Little People told me all the news.

The trees were such fine, independent fellows, big, generous, sturdy, growing according to their own ideas, never having known man's oppression, having no fear of his ax.

And the blossoms by the wayside! Daisies, buttercups, purple and blue blossoms of I knew not what, sweet briar and a hundred others. Such profusion, plain even to my poor eyes, that long years of stooping over a desk had injured.

Surely in this place my health would come back; I would be able to see clearly again; I would be able to eat and sleep.

We passed some people, and they smiled and bowed. So did I. It was the friendly way of the place and suited me very well.

We wound in and out among scattering houses, each with its garden and its flowers about it. I did not see a house without roses.

And then we came to my house, rose-clad also, with the Fairy Queen standing on the veranda and the Princess beside her, and the Youngest Fairy in front, laughing, jumping up and down, and calling my name.

Yes. I could eat. I had not eaten any real food for two days, but now it was different.

After supper the Little People took me out into the sunset and we crossed the main street of the village and gained the schoolhouse hill, where the sweet-scented new-mown hay lay all about us.

What scenes! The lake, just a little in front and far below us; three miles across (to the bosky bank of the opposite shore, with the farms rising above), stretching far as the eye could reach to

the north and far as the eye could reach to the south. The lake with the sky and the clouds in it.

What are those dark spots in the distance? Surely war canoes of the Iroquois. They will come nearer presently, and then we will see the painted warriors; and at any moment Natty Bumpo and Big Serpent may step out of the thicket, for this is the Leather-Stocking country and our ugly civilization has swept around it and past by, leaving it as it was.

And the sunset over all, and the birds singing. Trees, sunset, birds, lake, flowers, what are they but God's thoughts. I see a dozen poems so perfect that even Shakespeare could not have written them.

But the Little People are calling me. They have climbed down the hill. Can I follow? It goes down at an angle of fifty degrees, and I am wearing low-cut shoes. What if I get another sprained ankle?

Never mind. Thirty years ago I could climb with the best of them, and now I'll do what I can. I can play "follow my leader" yet, and the Little People are not going to crow over me.

So I climb down, slowly and cautiously. Why, thirty years ago I jumped down the bluff at Niagara, at the old "Maid of the Mist" landing, a sharper descent than this; I jumped from rock to rock and from tree to tree, and got down in no time. And now I dodder and hesitate like Pantaloon; surely the city has taken its toll of me.

But I get down at last and stand beside the Little People, their companion and their peer, and then away thru the bushes we go, the land still terracing downward to the shore of the lake.

Late as we are there is yet some light left, and we can see all the beach spread with flat stones for skimming.

Can I skim a stone on the water?

Why, of course I can. I used to be famous at it. People traveled miles to see me practise this art. Maybe I can teach the Little People some things.

Nevertheless, in spite of my brave words I am somewhat panicstricken. Have I really forgotten how boys throw? I can throw like a girl, of course; that's nature; a baby can do that. But can I throw like a boy?

I sat down on the beach and filled my pockets with flat stones; the Little People skipping all the time with skill and success.

Then I rose and essayed. My stone struck the water too close, made one great bound, and then went down, never to rise again.

The Little People laughed.

Wait now. That was a bad stone!

Again and again I tried. Good, better, best! I have the trick of it. Throw low, with a quick jerk of the arm, and a flat stone with rounded corners, not too light and not too heavy. Why, I made one skip ten times—better work than the Little People. Hurrah!

Then we went near the big hotel, for the Little People wanted to hear the band. But there were city folks there, especially a mob of young men from the city, loud and rude, who grated on me. We sat in the darkness and the band played, and I told the truth about it and was sorry afterward, for I found it was the village band and not an attachment of the hotel, as I had thought. Of course that made a difference. It was a good band and a credit to the village, and to be encouraged in every way.

And then we went home by the winding road along the lake shore. What a display of fireflies over the lowlands! I told the Little People the story about the Irishmen who thought that fireflies were mosquitoes with lanterns hunting for them, and they paid the tribute of hearty laughter—the story was new to them. Then I had a nervous attack for fear of ghosts, but the Little People reassured me. There aren't any ghosts—good!

Then away and away we went, winding up the hills on the road that showed dimly white under our feet. And we got home safe and pleasantly tired—ready for bed.

In the morning I viewed my estate. A pretty, pleasant little house with a wealth of roses about it—white roses, pink roses, and the lovely rambler, with its deep-red blossoms. And we had our own vegetables and cherries, any quantity of cherries, for the neighbors had said that we were to help ourselves from their trees if our own ran short.

After breakfast I sat among the roses reading Dr. Van Dyke's delectable book,

"A Fisherman's Luck," just the very book for such a place, full of cheerful philosophy and bright glimpses of nature. And as I sat there the door opened and out came the Youngest Fairy with his light hair waving up like flames and his blue eyes dancing with mischief. He was babbling fairy talk, with now and then a word I could understand—sometimes two or three words strung together, sounding very quaint. The Princess followed him with a tin dish filled with oxheart cherries, and the Youngest Fairy fed me those cherries, one at a time, and laughed a merry peal to see how intelligently I ate them.

When the cherries were all gone the Youngest Fairy took hold of the finest rambler rose to pull it.

"Don't!" I said. "Don't do that!"

To my astonishment he obeyed. So! He is learning that lesson at last! And he obeys not from fear, but from good will.

Presently I went for a walk in the woods and a snake glided past me. Thirty years ago I'd have been after him to have his life. Now I watched and admired. What a handsome fellow he was, mottled yellow and black, white underneath; as well equipped and well formed as an ocean steamer, and as competent to cope with his own problems. He carries his head high, being a self-respecting snake, and his mouth is innocent of poison; I could put my finger in it and his bite would not be more severe than that of a mouse.

In the afternoon I got around to the postoffice and met the Postmaster, the Justice of the Peace, the chief Grand Army veteran, the doctor and other worthies. The papers have come in, filled with Japanse war talk—nonsense! We don't believe that the Japanese admiral ever said that American crews would desert in case of war with Japan. We believe that the Japs are level-headed and want war as little as we do. Of course if they insist on it they can have a fight, but they won't do that. The publications only prove that Japan, also, has yellow papers.

We played chess. I thought I had forgotten, but not so. I am as good as I ever was, and we are well matched. Wonderful struggles ensue and we fight till only the king is left on either side. That is as it ought to be. Day after day we fight like this and the interest never flags.

One time the Postmaster has a trout dinner, and it stimulates his intellectual faculties to such an extent that he routs all antagonists. But when the effect of the trout subsides we overpower him and exact a bloody revenge.

On Sunday morning Hercules takes me for a drive to the Hilltop farm. I carry the Youngest Fairy, and he sleeps all the way there, as it is his time for sleeping.

I liked Hercules the instant I saw him. One has only to look in his eyes to see that he is a truth teller or to look at his jaw to see that he is a man. He had a hard, rough life in a big city and has very little book learning. But hear him discourse on farm matters and you find a pundit. Pig feeding, fencing, rotation of crops, cattle raising, care of sheep, marketing of produce, farm economy, he is full of knowledge. And he picked it all up in a few months, for before that time he was driving a wagon, and he and his wife and baby were crowded into a corner of a tenement. Now they have a farm with a nice farmhouse and any amount of room for them and the baby. Their expenses are very light; they are saving money, and in a couple of years they will be able to buy and stock a farm of their own. Meanwhile they're happy. Hercules likes the farm work better than anything he ever did before, and he and his employer are both square men who understand and appreciate each other. Instead of driving him, the employer has to persuade Hercules to take even portions of holidays, he is so thoroly interested in the work.

And Jack is as good as his master, here, provided he behaves himself—surely that is an inducement.

Abandoned farms lie all around—abandoned farms that any one may have on the easiest terms—for instance, by signing an agreement to divide the produce with the owner. Or the farms can be bought on payment of small installments.

And yet the cities are full of poor people, living miserably in the slums.

Beside the postoffice stretches the long

stoop of the harness shop, which I call the Reviewing Stand, because in the evening the judges sit there in a row and pronounce opinions on the passing show.

Why don't I take up one of these farms? How gladly I would if I could. I doubt my ability to work it. Maybe when the Youngest Fairy grows up we can do it, but I doubt. Every time I lift him on my lap he picks my pockets (even in presence of the Justice of the Peace), so I'm afraid he's going to be a Captain of Industry.

At the Hilltop farm we met a shrewd-looking farmer, of whom Hercules spoke with great respect as his mentor. Very teachable is Hercules, always trying to improve his knowledge. Whenever he is in a quandary he consults the Justice of the Peace, and acts on his advice—but everybody in town does the same thing.

On the way home again the Youngest Fairy woke up and talked to us very sociably, and we got home just as the first drops of rain began to patter down. On the way home Hercules told me a tale that moved me far more than the wrath of the Japanese. He has been setting eggs, hen's eggs and turkey's eggs, and some creature has been devouring them, breaking a hole in the small end and sucking the contents. Hercules thinks it's a weasel. He has had to give up setting until he gets a hen house fixt.

I thought I had good will toward every living thing here, but that weasel certainly stirs the Old Adam in me. Imagine the wretch, full of turkey eggs, lolling in his underground castle and chuckling with glee at the fix in which he has put the farmer. I want his life and listen eagerly to a plan for loading up some eggs with strychnine and giving them to him.

After dinner Hercules and I go to the edge of the ravine behind our house. The descent is so steep that I could jump right out into the top of a tall tree that rises from the bottom. I can trace the course of the creek that runs below. The place is beautiful, like all else here.

Hercules tells me a story connected with this ravine.

Three weeks ago a farmer returning to his home after a brief absence met two strange men on the road.

"Fine weather for corn," they said, and past on.

When the farmer reached his house he found that robbers had been there and had stolen cash and jewelry amounting to about forty-five dollars. Immediately he sent his boy up one road to raise the people, while he went up another road. Soon the countryside was out like a swarm of bees, led by the constable, who is also sexton and undertaker.

When I heard that description of the constable I had to sympathize with the pursued. It must be awful to be chased by an undertaker who is also a constable.

The trail led to the ravine, and as all roads were guarded and they were burning daylight, the pursuers felt that they had their quarry bagged. But where were the robbers?

The people looked up the ravine and down the ravine. No signs of them. At last some one suggested looking in the trees, and there were the villains hidden among the boughs.

"Come down!" cried the constable, pointing his gun, and down they came.

But where was the stolen property?

"Go back and search at the foot of the tree," said that Man of Good Counsel, the Justice of the Peace, when he heard of the difficulty.

Sure enough there was all the property buried.

A week later the robbers were sent to prison for four years.

The Little People came around to take me berrying. All right, I'll go. But first let us find a four-leaved clover for luck.

How can a four-leaved clover give luck? the Little People ask. They are sceptical, and scout the idea as silly superstition, like the belief in ghosts.

I am meek, but I am persistent. How could the belief be so widespread if it was not well founded? Besides, the clover will do no harm, and it is better to be sure than sorry.

We find the four-leaved clover, and then away to the berry patch, where we have great luck—strawberries and black raspberries. There now!

The Fairy Queen is to take me visiting and the Youngest Fairy comes and

dances in front of her, holding up his hands and screaming something that sounds exactly like:

"Mamma's a gee-gee! Mamma's a gee-gee!"

So, Young Hopeful! You're not the only sprout that looks upon mamma as a gee-gee. But I never before heard any one express it so frankly.

And if mamma is a gee-gee she isn't a riding gee-gee. She's only a carriage gee-gee, and you'll have to be content to ride with me.

Latest bulletins from Hercules now announce that the weasel is no longer suspected. It was the cat that ate those eggs, so they now believe.

Oh, you velvet-footed Judas! Oh, you sweetly smiling Iago! The weasel may be a freebooter, a robber, a gentleman adventurer, but he is no traitor. He did not seek the farmer's franchise or take an oath of office to him, nor is he fed by the farmer's hand, warmed by his fire, sheltered by his roof. But you, Puss! You! Employed in a confidential capacity, appointed a police force, receiving the emoluments of office, yet slyly robbing those who trust you. How can you look an honest person in the face? You GRAFTER!

There is fine, close-cut grass here, where the Youngest Fairy can tumble and run barefoot without fear. He chases the neighbors' chickens, but is yet so shaky on his pins that he does not worry them.

The other day he saw a fly on the tablecloth and pointed at it.

"Chick! Chick! Chick!" he said.

We thought that very good. Evidently to his mind any little thing that runs is a chicken.

I have a comfortable theory to the effect that you can't hurt fairies of his age by tumbling them about—that they can roll downstairs without the least danger. The Fairy Queen dissents with emphasis and volubility.

My theory works well generally, but there are exceptions, as in the case when he fell off the veranda among the vines. He really did hurt his arm somehow. The doctor came to see. He worked the joints of one arm, while I worked the joints of the other, and between us we had the Youngest Fairy thoroly puzzled, so that he did not know what we were up to, but finally concluded it to be some game and laughed at us.

There was nothing the matter with him except a slight sprain, and my theory is almost as good as new.

The young heifer knocked Hercules down and stepped on his chest, but I could not help sympathizing with her. She had been separated from her calf and was distracted. They had a fifty-pound clog on her foot, but somehow she got rid of it and jumped the fence and was found beside the creek gazing up and down for the lost one. Dim as her mind was she *knew,* and was there to do her duty.

While the little barber was shaving me he asked: "What breed do you think that dog is?"

"Mastiff," said I.

"His mother was a greyhound and his father a sheep dog," said he. "He thinks a lot, that dog does. He comes in here to think. If he's on the street the children want him to play with them. He belongs to my brother up at the depot, and he plays all the games that the children play. The other day my brother caught him sliding down hill as the children slide. It was down a sandbank. The dog was alone and doing it for his own amusement. He would walk to the top of the bank, slide down, walk to the top again, and again slide down. He kept it up for twenty minutes."

I tell it as the barber told me, and I hope no Distinguished Person will object.

The Youngest Fairy has five new teeth, the sharpness of which he likes to try. He caught my finger when I was reading Thoreau's "Walden," and gave it a convincing nip. My squeal, the look of affright on my face and the agonized manner in which I shook my hand delighted him.

The Little People came to take me down the ravine, and I would not go before we had our fortunes told in our teacups, tho they said that was nonsense too.

But it all came true, for we did go on a journey and did meet a light man and a dark man.

The ravine was as wild and beautiful as Watkin's Glen, and well worth the trouble we had to climb down and follow the creek up its rocky bed.

The Postmaster beat me the last chess game. Who cares? Chess is all luck, anyhow!

Well! Back to the city again. But those days were good, even if they didn't last forever.

SENECA LAKE, N. Y., July, 1907.

Prohibition in Georgia

BY THE REV. LOVICK P. WINTER

THE good State of Georgia, which its citizens love to call "the Empire State of the South," takes its place, along with Maine and Kansas, as one of the prohibition States of the Union, and enjoys the distinction of being the first Southern State to adopt a State-wide law prohibiting the manufacture and sale of all spirituous and malt liquors within its bounds. This action was taken when, during the last days of July and the first days of August, the present Legislature adopted what is called the Hardman-Covingwon-Neel Prohibition bill, and when, on the 6th of August, at 11 o'clock a. m., Governor Hoke Smith affixed his official signature to that bill, thus making it the law of the State. This act of the Governor was witnessed by two or three hundred people—as many as could get within sight of him in his private office—and the little company broke up by singing the long-meter doxology, and the Governor declared that it was the happiest day of his life.

Three facts are notable in connection with this action of the Georgia Legislature. In the first place, it is a matter of surprise that this measure should have been brought forward at this session of the Legislature at all. It was hardly an issue in the famous campaign which Hoke Smith made for the Democratic nomination for Governor last year. And Governor Smith really favored local option, and not State prohibition, as he announced distinctly in his inaugural address. The utmost that the Anti-Saloon League hoped to accomplish was the passage of what was called an "anti-jug law," the purpose of which was to prohibit the shipping of whisky from the "wet" counties of the State into the "dry" counties. Governor Smith favored this, and the most strenuous advocates of local option, as against State prohibition, came to favor it with an ardor that was amusing, to say the least.

Another and even greater surprise in the case was the large majority which the bill received in the two Houses of the Legislature. The Senate adopted the bill by a vote of 34 to 7, while the House past it by the overwhelming majority of 139 to 39.

And the bill itself is notable by reason of its stringent nature. Perhaps no more drastic legislation touching the liquor question has ever been placed upon the statute books of any commonwealth. Under its provisions no person can keep for sale, or to give away to induce trade, any spirituous or malt liquors, and even physicians cannot prescribe anything but pure alcohol for their patients, and all such prescriptions must go on record in the office of the ordinary of each county where they are filled. The sale of denatured alcohol is not forbidden, and an exception is made where alcohol is used for certain prescribed scientific purposes. And the manufacture for sale of domestic wines is prohibited. In this connection it should be noted that Dr. L. G. Hardman, the author of the Senate bill, which past the House without much change, is a physician of thirty years' standing, has operated for a number of years a sanitarium in Commerce, his native town, and has none of the elements, in character or reputation, of the temperance fanatic. His leadership in this movement is not the enthusiastic work of a hobbyist, but has been prompted by the dictates of intelligent, clear-headed conviction as to what is best for his people.

This action of the Georgia Legislature,

as surprising as it may seem to be to many people in the State and out of it, has back of it a history which, when fully understood, will show that it is not a sudden and ill-considered revolution, but a reform that is the effect of many concurrent causes. It may be well to study some of the causes that have combined to bring about prohibition in Georgia—the law goes into effect the 1st of next January—since they reveal certain facts and phases of Southern life and character with a distinctness not always found in the abstract study of social and political conditions.

Prohibition is really no new thing in Georgia. For nearly twenty years after the settlement of the colony by General Oglethorpe, in 1733, the importation of rum and African slaves was prohibited by the trustees of the infant colony. And one is tempted to wonder if it would not have been better for the State if this original policy had been adhered to in all the after years of its history. As it is, after more than a hundred and fifty years, Georgia returns to her old freedom from slavery and the liquor traffic. She gave up slavery somewhat reluctantly in 1865; in 1907 she gives up the liquor traffic with joy and rejoicing among a large proportion of her people. But it is a far cry from the middle of the eighteenth century to the beginning of the twentieth, and the existence of prohibition under the governorship of James Oglethorpe and several of his successors had only a tenuous connection with the adoption of prohibition by the Georgia Legislature of 1907. The causes of this action are not so remote, but are to be found in social and moral conditions of the present and recent past.

The great temperance movement of the last century found ready response in Georgia. The "Washingtonians," the "Sons of Temperance," and later, the "Good Templars," all had many followers in the State. And Georgia even originated a temperance order of its own, which was known as the "Knights of Jericho." The effect of the educational work of these orders upon public sentiment has unquestionably contributed greatly to the adoption of prohibition in the State. None of them were long-lived, but each one left its increment of conviction with the young men and women, as well as those that were older, who were members of these several societies, and this conviction has been a silent but potent force in bringing about what sems so sudden and radical. In fact, the adoption of prohibition in Georgia is a new confirmation of the potency of well-directed and persistent effort to educate men and women in right ways of thinking and action.

And the churches of Georgia have done the largest part in bringing prohibition to the State. It will be remembered that by far the largest number of people in the State that affiliate with any Church are Baptists or Methodists. As a matter of fact, nearly one-third of the total population of Georgia are members of the Baptist or Methodist Church. And while these two great churches have sometimes differed pretty widely as to how, and how much, water is to be used at certain times and places, they have agreed for many years, in their official deliverances, that no whisky at all should be used. The resolutions past by conventions, conferences and associations within the past twenty years would make, if printed, many large volumes. And they have made what is more powerful—the sentiment which has made prohibition possible in Georgia. And other churches have not been indifferent to the issues involved. Presbyterians, traditionally conservative, have not hesitated to speak out concerning the evils of the open bar and the use of whisky as a beverage. And others have not been idle. In truth, no class of men have generally been so active in this movement as preachers. From the pulpit and the platform, in the homes of the people, and upon the stump in prohibition campaigns, they have spoken with effectiveness and profound conviction, and have used all the possible influence of their station and talents to advance prohibition. And the recent action of the Georgia Legislature is a demonstration that the Church has not lost its power over men's consciences.

The Woman's Christian Temperance Union and the Anti-Saloon League have contributed much toward the creation and crystallization of the prohibition sentiment of the State. And that the race question has been one of the potent causes of the recent legislation cannot be

denied. The negro is temperamentally given to the use of alcoholic stimulants. Under slavery a drunken negro was rarely ever seen. Every plantation was dominated by prohibition. A "dram" at Christmas time or corn shuckings was the extent of the negroes' tolerated indulgence in strong drink. But since the abolition of slavery, whisky has been the curse of the negro's life. He has been ready to accept it whenever it could be had, and vote for its sale whenever a popular election was held on prohibition. He has been the willing dupe of the men who sold whisky or favored its sale. It is safe to say that Georgia would have been dry today under local option but for the negro vote. And it is equally safe to say that there would not be half the negroes in the chain gang if there had been no whisky sold in the State within the past forty years. The very worst traits of human nature, and of negro nature especially, are brought out by whisky. It is whisky which makes of the negro a criminal, a pauper, a vagrant and a menace to the homes of country people. And the sale of whisky in the larger towns has caused a congestion of negro population in the cities, much to the detriment of the farmers, and to the hurt of the cities themselves. Every real friend of the negro is glad of the enactment of prohibition in Georgia.

Prohibition is really no experiment in Georgia. Under special acts of the Legislature many localities have been free from the sale of whisky for many years. In 1885 a general local-option law was passed by the Legislature by a very narrow majority. This law has been amended a time or two, and in 1890 what was known as the three-mile law was put upon the statute books. This law forbade the sale of whisky within three miles of any church or schoolhouse outside of an incorporated town. This act practically confined the sale of whisky to the incorporated towns, and finally, as county after county voted out the sale, to the larger cities. Dispensaries were established in several counties, Athens, the seat of the University of Georgia, claiming the original dispensary of the country, and furnishing a model for the dispensary system of South Carolina. At one time, only a few years ago, it seemed likely that something similar to the South Carolina plan would be adopted in Georgia. As far back as 1855, Hon. B. H. Overby was a candidate for Governor on a prohibition platform, but was most ingloriously defeated. In 1902 Hon. Dupont Guerry canvassed the State as a candidate for Governor, advocating practically the same policies on which Hoke Smith ran last year, except that he placed more emphasis upon the adoption of State prohibition. In fact, the question has been a live issue in Georgia for many years, with the sentiment constantly growing stronger in favor of prohibition, and more and more counties shutting out the sale under the local-option law. So steady had been the progress of prohibition that when the lawmakers met in Atlanta the last days of June, only about 20 of the 145 counties remained wet. But in these wet counties were situated the principal cities of the State—Atlanta, Savannah, Augusta, Macon, Columbus and others—and these cities objected strenuously to the passage of a State prohibition law. This, it was said, was undemocratic; that it would ruin the cities; that the law could not be enforced; and a great effort was made in the House to defeat the bill by filibustering tactics. Every leading daily paper in the State, except the Atlanta *Georgian,* fought the bill. In short, everything possible was done to defeat the law, but it was placed upon the statute books by a majority which indicates by its very number the strength back of the movement. Prohibition had been tried with such satisfactory results in so many rural counties of the State that the country people could not be made to understand why it would not be good for the cities as well. When told that Atlanta had tried the experiment and had abandoned it, they remembered what Henry Grady had said about the good effects of prohibition in Atlanta, and that the city was put once more under the barroom régime by the most unscrupulous playing upon the superstition of the negroes by one known as "Yellowstone Kit."

It is too early yet to speak of the effects of the law, but all its friends ask is a fair trial and a faithful enforcement of it.

HEPHZIBAH, GA.

Walking

BY ELLA M. BOULT

COUNTRY life has taught us much, but it has not yet made walkers of us. Physicians testify that no exercise is so generally beneficial as walking; every naturalist—or nature lover—will tell you that no other means is so good for knowing the country; every walker proclaims that no other pursuit gives so much pleasure. Still no one walks. Men walk no more than women. We are so prone to imitate our English cousins, why does their love of walking not rouse us to emulation? Conscience, fashion, or inclination impel us to ride, drive, row, swim, fish, hunt, golf, play tennis; we even chop trees and saw wood for exercise if we are strenuous and incline to the simple life, to say nothing of making gardens; we own and drive airships, automobiles and motor car of all descriptions: but we do not, will not, and, in fact, cannot walk.

Some one protests. I have known a few who claimed the distinction of being walkers, and I have observed them. They are of several not very well differentiated classes. One sort consists of those who take a leisurely stroll of a mile or so daily when not prevented by the weather or by some small happening; another is made up of enthusiasts who, at a fixed time daily, in all weathers, jog over a fixed distance, taking great credit to themselves for their energy, or their unconquerable love for nature and the elements; a third and common type includes the meanderer who, in a maze of sentimentality over nature, trails off occasionally into the nearest woods, where he assuredly loafs, and presumably invites his soul; finally there are those who organize walking trips. These expeditions are usually manned by enthusiasts who have never walked more than three miles at a stretch. They are enemies for life at the end of the first day, and such as survive the second are sustained only by the hope of reaching a railway station.

The only genuine walker is he who at all seasons, in all weathers, under all conditions—barring illness—and in all localities walks briskly four or five miles at a stretch *every* day. This is a minimum distance. No one who enjoys walking will want to walk less, and one who does not will not walk at all. Walking should be a pleasure—a treat, to give up which would be a serious sacrifice. Not to walk in the rain is to lose a delightful phase of the pleasure; not to walk in snow-covered fields and woods is to relinquish more than can be told; not to walk in the cold is to forego the most exhilarating sensations.

As to dangers arising from inclement weather—from extreme heat or cold, or from dampness—they are neutralized by the immediate benefit of the exercise. So long as one is in vigorous motion, and allows freedom to all the muscles and organs, a wet skin will do no harm, whether it is the result of rain and dampness from without, or from a normal and healthful perspiration. It is a matter of years' experience that the hottest day is none too warm for country walking. Where buildings and pavements hold the heat, as in cities, less benefit or pleasure is to be expected, but even so, if the temperature must be borne, it is more safely and comfortably endured with the gentle but thoro exercise that walking affords than in an uninterrupted quiescent state that leaves every part of the system devitalized. The force of briskly circulating blood, the snap of muscle and sinew, the braced nerves—in short, the exhilaration of vital forces dependent upon exercise—greatly outweigh the resultant wear and tear and all adverse conditions, and make for health. The result is a positive good, whereas the inert experience only negative good. These at best maintain a dull equilibrium of forces.

There are two chief reasons why we do not walk: First, it bores us; second, it tires us. Both boredom and weariness are greater evils than appear on the surface, and the cure of each lies in walking. It is a truism that exercise should not be an end to itself; and the defense

pled by non-walkers is that, whereas every other form of exercise has incentive, walking has none. One walks, say these, for the sake of walking. The revelation of this statement is appalling. What is the animating spirit of other forms of exercise? It is the gaming spirit, the matching of skill against skill, the prevailing of one over another thru the training and control of forces and faculties as in tennis, football and all athletic sports, or the sheer joy of sensation, as in swimming and skating and the like. Nothing could be better so far as it goes; but this does not comprise the whole joy of living. The beauty that has been the inspiration of poets and painters for centuries is before you. It is for the walker. Heaven forbid that if you could be made to behold it you should make of it a poem or a picture; but if the scales could be struck from your eyes, you would experience untold pleasure in going forth, day by day, to fill yourself with marvels such as you value now only when won at great expense of time, trouble and money.

Fool! why should you spend days and nights of discomfort to see the Yosemite, you who have not wit enough to travel down the field across the road and explore the lovely valley at its foot? Why the Nile, the Rhine, the Hudson, the Mississippi, when the brook a stone's throw away is nothing to you? Why the Alps when your eyes have never seen the glory of color on the hills that surround you? Why the flora and fauna of distant lands when ou do not know a single one of your native orchids, every bit as marvelous in structure as those of the tropic jungles for which fortunes and lives are paid.

But even those of us who are in some degree "alive to gentle influence of landscape and of sky," are inclined to be skeptical as to the advantages of walking. A distinguished New York editor once said to me that he preferred driving to walking, because *the thing one wanted to see was always so far away that one was weary before reaching it by the latter method.* Out of his own mouth was he convicted. His apathy to walking was derived from experience in driving, wherein one never really sees what is near at hand. To the walker the *thing he wants to see* is never far away: it is at his very feet. No argument followed; but two weeks later Mr. Editor volunteered the statement that he had changed his mind: that the microscopic eye was more fruitful of results than the telescopic.

The second obstacle to our enjoyment of walking is that it tires us. Now this weariness is two-thirds composed of boredom; but the remaining third is a very genuine physical disability. Both, as has been said, yield readily to the very exercise that creates them. Three days persistent walking under favorable conditions will cure both maladies. These conditions are simple in the extreme: walk briskly; dress properly. It is a great mistake to suppose that slow walking is less tiresome than rapid. In leisurely movement the circulation is not stimulated, the muscles do not gain the necessary elasticity and spring to act automatically, the nerves are not alert, the mind is sluggish and fixed on the locomotion. Twenty minutes to the mile is a good average gain for up hill and down. If such a pace seems tiresome, it is much better to stop for a moment or two at intervals to rest than to diminish the speed. This is not, however, rapid walking. Eighteen minutes to the mile is enough for a strong walker, and fifteen minutes is not too little for brisk exercise. But there is no advantage in being too strenuous in this form of exercise, the chief claim of which over others is that it may be graduated to one's strength and humor, that it is at once gentle and thoro. For the same reasons that prevail against slow walking, it is easier and better to walk five miles at a stretch, as soon as such a distance has ceased to be an unpleasant exertion, than to take two or three short walks during the day. Nor must it be supposed that rapid walking precludes observation. Train your perception to be keen and quick, your faculties to be on the alert and active. When you have found an object of interest, of pleasure, of amusement, devote as much time to it as you like; but, meanwhile, never dawdle. He is a poor walker whom two seasons does not suffice to post on the flowers and birds of his locality. The walker should be as completely *en rapport* with the doings of

"all outdoors" as is the village gossip in her realm.

Much might be said, and little *need* be said on the subject of dress for the walker. Every portion of the clothing should be loose enough not to constrict any portion of the body. The throat, the chest, the waist, the hips, the ankles, the feet must have absolute freedom of motion to insure unlimited benefit and pleasure in walking. Beyond this the clothing should be light, and, for country walking at least, strong. Wear shoes with low heels, or with none, as inclination dictates; but shoes with smooth soles are impracticable for general walking, since they are so slippery as to make it impossible to keep an easy footing on the dry leafy surface of field and wood, or on rocky ground, and will not carry one comfortably over stone walls, fences, brooks and other features of cross-country walking. There is just now a great hue and cry about breaking down the arch of the foot. This, say the fashionable doctors, is due to the broad, flat shoe affected by the "athletic girl." The statement is absurd, and sufficient to lay its originators under suspicion of being in the pay of the shoemakers. The condition of "flat foot" when it exists results from corseting the foot out of its natural shape, giving it no exercise, and thus preventing its development. It has no form of its own, and is therefore plastic to the atrocities which pass for shoes. The doing away with these abominations is one of the reforms that walking would perforce effect, since it is impossible to walk without developing the muscles, and a foot with live muscles will no more submit to the restraints commonly imposed upon the feet of fashion than it will break down its arch.

There are many regulations and principles that might be formulated about walking: but for the walker, walking will dictate and enforce the essential rules; as to the non-walker, he, like Ephraim, "is joined to his idols—let him alone."

POMFRET, CONN.

You!

BY COUNT LEO TOLSTOY

THE Tyrant called unto himself the Sage in order to ask him about the best way of wreaking his vengeance on his enemy.

Tyrant—Name the most cruel, slow torture by means of which I could torture the criminal to death.

Sage—Compel him to realize his sin and leave him to his conscience.

Tyrant—According to you, then, there is such a thing as conscience. Listen! My kinsman has heaped upon me a cruel insult, and I cannot be cheerful or calm again until I have had my revenge. I have thought of the most terrible tortures, but I could not find anything that would give the proper vent for my anger.

Sage—Nor will you be able to find such tortures, because you cannot destroy with any tortures either the crime itself or the one who has committed it. Therefore there is but one wise way out of it—forgive!

Tyrant—I know that I cannot destroy that which was; but why do you say that I cannot destroy the crime?

Sage—Nobody can do it.

Tyrant—What nonsense! I can destroy it immediately, even as I can destroy this lamp, which will never give any light again.

Sage—You may destroy the lamp, but not the light; because the light is everywhere, wherever it burns; the same light exists by itself in everything. You cannot kill the criminal, because you yourself are the man whom you wish to kill!

Tyrant—You are either a madman or a jester.

Sage—I am telling you the truth; *you* are that criminal.

Tyrant—According to you, then, I have insulted myself and I must destroy myself in order to redeem that insult?

Sage—Not at all; no evil can be redeemed by bloodshed. To redeem your insult you would have had to destroy all

humanity, for humanity is to blame. But even that which offends you would have remained, for, as you yourself said correctly, you cannot make that which was cease to be.

Tyrant—However strange your words are, there is still a grain of truth in them. Speak more clearly!

Sage—Look about yourself at all that is living and say unto yourself: "I am all this." All human beings are brethren; that is, all human beings are in essence one and the same Man. Before the Higher Justice there is no wrong that is left unpunished. When you raise your hand against your enemy you strike your own self, because the offender and the offended are in essence one and the same.

Tyrant—I do not understand you. I rejoice over the sufferings which I cause to my enemy. Could this be possible if he and I were the same?

Sage—You are rejoicing over the sufferings which you cause to your enemy because you are enveloped by the deception of your revengeful, imaginary personal "ego," but when you will awaken to the consciousness of your real "ego" you will feel all his sufferings.

Tyrant—These words sound like those of a madman. Make it so that I should feel that I and the criminal are one and the same being.

Sage—It is hard to do what you desire, but I will make an attempt. I will bring you to such a state now that you will feel the unity of mankind in all human beings.

And the Sage, who had the faculty to do this, called forth in the Tyrant's soul the same impressions and feelings on account of which his enemy had offended him. In this state the Tyrant owned that he was the one whom he had hated, and the causes that had led his enemy to offend him now became clear to him. From this viewpoint he could not find any ground for hating him, because he understood that the person was not the real essence of man, but that the consciousness of the unity of all humanity was the foundation underlying all personalities that reveal themselves in various degrees.

When the Tyrant returned to his former state he asked the Sage the following question:

Shall I tell you what I have learned just now?

Sage—Tell it to me.

Tyrant—I have seen the truth as thru a cover, and I have learned that beyond that cover all humanity composes one being, and my friends and my enemies are portions of that being, even as you and I. He who offends humanity offends you and me, and all humanity.

Sage—This is the truth which I wished to instill in you and which is expressed in the word *"You."*

Tyrant—How is one to live in this world after this?

Sage—The servant is serving; the merchant is trading; the warrior is protecting his country; the ruler is ruling. Each one has his own sphere of activity. But the enlightened has nothing in common with this; that which is regarded in those spheres as a high virtue would be a crime, an act of madness, in the eyes of the enlightened. Now you have become enlightened, now you have noticed the ray of that light which shines for all, but which is perceived by but few, and you can no longer return to the darkness.

Tyrant—Help me to find the clear light. I do not want to be "I," I do not want anything perishable; I want to be impersonal, without regard of time, like you——

The Tyrant soon after this incident became reconciled with his enemy, he found out the destination and the goal of life, and he went along the road leading toward eternal peace.

YASNAYA, POLYANA, RUSSIA, July, 1907.

The Actual Cost of Living

BY ALBERT BRITT

[The capitalists and the trade unionists were never so rich as to-day. All other classes in America will appreciate in a very real sense the following article by Mr. Britt, the Associate Editor of the *Railroad Man's Magazine,* and formerly Editor of *Public Opinion.* We shall follow it in a subsequent issue with an equally suggestive article on "The Decent Cost of Living."—EDITOR.]

THIS is an era of great prosperity—the newspapers daily attest it; employers of labor proclaim it; organized labor admits it, at least to the extent of claiming that it is at last, thanks to its own efforts, securing a part of the rightful share that has hitherto been withheld from it; and Government reports point to high wages and continued employment as proof of the same desirable condition.

But what is prosperity? To the capitalist it is large and frequent dividends. To the farmer, the manufacturer and the merchant it is high prices and quick sales. To organized labor it is good wages and steady employment. Judged by the standards of these three classes prosperity may be admitted, at least for the sake of argument. But these questions concern solely the side of income in the problem of living; to solve the problem the outgo side must be considered as well. In other words, the crucial question is, Are increases in wages keeping pace with the increasing cost of living?

Not long ago the Massachusetts Bureau of Labor Statistics reported that in 797 stores in Boston the number of debtors on the hopeless list was 45,482, about 7½ per cent. of the population of the city, with a total indebtedness of $570,912. In the last of non-payers 2.32 per cent., or a little over one thousand, were classed as moneyed people. Therefore more than 7 per cent. of the inhabitants of the entire city were unable thru lack of funds to meet the current expenses of living.

To charge 45,000 people with extravagance or downright dishonesty is too wholesale an indictment. Was it not rather a failure in the hopeless struggle to make both ends meet and to maintain a decent standard of living at the same time? Have not these people been caught in a maelstrom of high prices and, in order to live in the present, been forced to neglect the obligations of the past and discount the possibilities of the future? In other words, are they not paying the cost of prosperity?

In two bulletins issued last year by the Bureau of Labor of the Department of Commerce and Labor statistics were presented showing the relation of the cost of living to average annual incomes in the year 1905 as contrasted with the ten-year period 1890 to 1899. In the first of these two bulletins wholesale prices of 259 articles of common consumption were tabulated for sixteen years with the following result:

The 1905 average, contrasted with the year of lowest average prices during the sixteen years from 1890 to 1905, in each of the general groups of commodities, shows farm products 58.6 per cent. higher than in 1896; food, etc., 29.7 per cent. higher than in 1896; cloths and clothing, 22.9 higher than in 1897; fuel and lighting, 39.4 per cent. higher than in 1894; metals and implements, 41.8 per cent. higher than in 1898; lumber and building materials, 41.4 per cent. higher than in 1897; drugs and chemicals 24.1 per cent. higher than in 1895; house furnishing goods, 21.5 higher than in 1897.

and the materials included in the miscellaneous group, 23.4 higher than in 1896.

Summing up these statistics it is seen that the average cost of these articles was 15.9 per cent. higher than the average for the ten year period. In the later bulletin, which deals with wages and hours of labor from 1890 to 1905, it is shown that average earnings per week in the latter year were only 14 per cent. higher than the average from 1890 to 1899, leaving cost of living, according to these statistics, 2 per cent. in the lead.

But these statistics do not bring the facts home to us with sufficient force. It is necessary, also, to know how large a part of our annual incomes, be they large or small, is expended for each one of these items. It is well to know, still further, how much each family has to spend in the course of a year. So much stress has been laid in recent years on the American millionaire, his iniquity, his generosity, his prodigality, and his penuriousness, that our eyes have become blind to the fact that the great majority of us are well content to live out our days in moderate comfort, if as well as that.

In the grand average the millionaire cuts a very small figure indeed. Here again the tireless Bureau of Labor at Washington comes to our aid with statistics showing the incomes and the expenditures of a large number of families.

Households to the number of 25,446 in all parts of the United States, averaging approximately five persons to the family, have been canvassed with the following result: The average annual income per family is $751.34; the average annual expenditure is $689.61, leaving a margin between income and expenditure of $61.73 on the profit side.

Food, the basis of the physical life, constitutes by far the larger part of this expenditure, or 42.54 per cent.; rent eats up 12.95 per cent.; clothing takes 14.04 per cent.; fuel and lighting account for 5.25 per cent.; taxes and principal and interest on mortgages, which together with rent must cover the cost of lumber and building materials as well as ground rent, amount to 2.33 per cent.; furniture and household utensils are answerable for 3.42 per cent., and sickness and death, no small part of the expense of which is chargeable to drugs and chemicals, demand 2.67 per cent.

The remainder is divided in small portions among insurance, labor and other organization fees, religious purposes, charity, books and newspapers, amusements and vacations, intoxicating liquors, tobacco and "other purposes." Religion claims only .99 per cent; charity fares even worse with .31 per cent.; while 1.62 per cent. is dissolved in alcohol and 1.42 per cent. goes up in tobacco smoke. Amusements and vacations are responsible for 1.60 per cent. and 1.09 per cent. are devoted to the alleged improvement of the mind in the purchase of books and newspapers.

To make the matter still more concrete, the average family spends each year $114.83 for rent; $37.53 for fuel and lighting; $97.39 for clothing; $305.32 for food, and $148.73 for all other purposes. In the year 1905, therefore, this same family spent for food $71.28 more than in 1896; for clothing $18.32 more than in 1897, and for fuel and lighting $7.88 more than in 1894.

Dun's index figure of wholesale prices gives the best available basis of comparison, year by year. This shows that the average actual cost of commodities per individual in the United States on July 1st, 1906, had increased over 1905 to a marked degree. Food of all kinds had risen from $47.399 to $49.385; clothing from $17.986 to $19.177; metals from $15.916 to $16.649, and miscellaneous articles of general use from $17.061 to $19.555. The total cost had risen from $98.312 to $105.216, the greatest increase that has taken place in any year for the last decade except from 1901 to 1902.

As compared with 1896 the total cost has increased from $74.317 to $105.216, a rise of more than 41½ per cent.

In order to find the actual cost per family from these figures it is necessary to multiply the statistics for individuals by 4.7, the average number of persons per family according to the census of 1900, and to add to that the retailer's profit. Rent is not included in Dun's index, nor are taxes or principal and interest on mortgages. For purposes of comparison between various years, however, no better basis can be found.

In April of the present year still an-

other bulletin was issued by the Bureau of Labor which shows that the level is rising still higher. This statement, which covers the entire year 1906, shows that the wholesale prices of the 258 commodities included reached a higher point than at any preceding time in the seventeen-year period under consideration.

The average for 1906 was 5.6 per cent. above that for the preceding year; 36.5 per cent. higher than in 1897, the year of lowest prices since 1890, and 22.4 per cent. higher than for the decade from 1890 to 1899. The highest point attained since 1890 was reached in the last month of last year, when the average was 4.1 per cent. higher than for the year and 6.3 above the average for the same month in 1905. Out of the nine groups into which the 258 commodities were divided, only two showed a decrease as against 1905, farm products and drugs and chemicals.

So much for the figures of expenditure. How has income fared? The second of the 1906 bulletins referred to deals with the increase of wages as compared with the retail prices of food. It shows that in 1905 the purchasing power of an hour's wages was 5.8 per cent. greater and of a week's wages 1.4 per cent. greater in terms of food only than the average for the period from 1890 to 1899. But it will be observed that in this bulletin wages are translated into food only. Man does not live by bread alone; he lives also by rent, clothing and the numberless other necessities of life included in the 259 articles listed in the first bulletin.

The latter of these two bulletins neither supplants nor supplements the other. In the first all the articles which enter into the daily cost of living are considered. In the latter food cost alone is taken into account as providing an estimate for average expenditures. Even in its use of food statistics as a part of the cost of living the Bureau's method has been subjected to severe criticism. Dun's index figure gives 50 per cent. value to the food products as against the Labor Bureau's 25.

These systems have recently been attacked by Francis B. Forbes in the publications of the American Statistical Society. Taking the Labor Bureau's increase in the index figure of 29.2 and Dun's of 38.7 since 1897, he has struck a mean between the two, something after the method in use for a long time in England, and finds that it yields 36.6. Thus 40 per cent. increase in the cost of living is not an excessive estimate for the end over the beginning of the decade that closes with the present year. This coincides also with Dun's figures quoted above.

Those who argue that the present time is one of great and undiluted prosperity for all classes will find small comfort in these figures. To cover the increase in the cost of living which we have noted a more than normal addition to the payrolls of the country will be necessary. Ten or even twenty per cent. increases in wages will hardly compensate for a 40 per cent rise in the cost of the articles necessary to keep soul and body together.

New York City.

Ships of Souls

A Japanese Custom

BY NELLIE EVANS

Down the dark and silent stream,
  Past the pine tree's fragrant breath,
Past the meadow, past the shrine,
  Sail these argosies of death.

A fleet of souls by incense borne,
  To the deep, unasking sea.
Love, when I am dead, wilt thou
  Float a votive ship for me?

Englewood, N. J.

Literature

Schofield's English Literature

WHATEVER the merits of Professor Schofield's book,* it is not particularly clear or easy reading. To piece out from it an intelligible account of the growth of the Arthurian legend, for instance, is a matter of some difficulty. A definite statement of the number and titles of Crestien de Troyes's Arthurian pieces is nowhere to be found, at least in that connection. Nor are the steps of the historical sequence, as known or conjectured, much more definitely marked and specified. The consequence is that the reader is left to do a good deal of groping alone—unless he happens to be acquainted with the way already. Of course the period is a difficult one. But its difficulty is increased in part by Professor Schofield's method, which consists in a general chronological order but a separate treatment for each branch or province of literature represented. This method, which is undoubtedly the right one in theory, as following the natural course of literary development, has the practical disadvantage of carrying him several times over the same names and dates, and of inspiring him with a misleading confidence that what is not explicitly stated or explained in one place will yet come out clearly somehow or other elsewhere. In fact Professor Schofield has no great expository gift; and any one who is trying merely to get "the hang of" the Arthurian story would do better to go elsewhere.

Nor is Professor Schofield's criticism very much better, as a general thing, than his exposition.

> "The Breton tales will always live because they can never cease to fascinate and bespell. . . . Like the knights of old, we, too, are charmed by Otherworld illusions, beguiled by ethereal beauty, entranced by unearthly melody. We, too, love
>
> 'The forest and enchantments drear,
> Where more is meant than meets the ear.'
>
> We, too, delight to look from
>
> 'Charmed magic casements opening on the foam
> Of perilous seas in faery lands forlorn.'
>
> The *lande aventureuse* is irresistible in its appeal."

What could be more inept, more amateurish in the way of criticism than this, with its stilted raptures and redundancy of quotation—there is still another paragraph capped by another poetical citation—as tho the writer were concerned to show that he, too, is as well acquainted with modern letters as medieval manuscript?

This is pretty bad, to be sure. But after all it is only the reverse of the pattern. Nothing, for example, could be better than the introduction. As a general survey of the entire period it furnishes a brilliant exception to the foregoing remarks. And then Professor Schofield is a scholar, and for the scholar his book has its own value. In one sense the history of the period has never been written so thoroly and with so scrupulous a regard for the facts. With the material Professor Schofield is evidently familiar and has formed his own impressions of it. For this reason his statements are of weight, even when they differ, as they sometimes do, from opinions usually held. No doubt, the greatest blemish on the book, is its irregularity—or rather its incongruity of tone. But, take it all in all, as a literary chronicle the student of English literature can hardly afford to do without it.

*ENGLISH LITERATURE FROM THE NORMAN CONQUEST TO CHAUCER. *By William Henry Schofield.* New York: The Macmillan Company. $1.50.

The Fourth Gospel

IT is only two or three years since there appeared two elaborate works on the Gospel of John by Principal Drummond and Professor Sanday, both of whom are able scholars and critics, yet now we have another by a Scotch clergyman,[1] whose name has not heretofore been celebrated, which, for penetrating insight into the character of the gospel and sympathetic

[1]THE FOURTH GOSPEL: ITS TEACHING AND THEOLOGY. *By Ernest F. Scott.* New York: Imported by Charles Scribner's Sons. $2.00.

appreciation of its teaching, will not easily be surpassed. Authenticity and date Mr. Scott does not discuss, but, assuming that the evangelist wrote at the beginning of the second century, he inquires what induced him to compose a gospel at that time, what errors he desired to correct, what dangers he hoped to avoid, what doctrines he desired to make prominent, how he came to make use of the idea of the Logos, and many other questions which occur to thoughtful readers of the Fourth Gospel, but which the commentators have neglected largely for the problems of authorship and time of writing. That the Gospel of John is different from the others every one realizes, but how it came to be different, and in what measure its differences are to be accepted as valid expressions of Christian truth, are difficult questions. Mr. Scott, however, has thrown no little light upon them, and his treatise is to be commended as an exceptionally discerning study of the contents and teaching of that document of early Christianity which is at once the simplest and the most profound. A more complete and enlightening presentation of the Johannine theology has not been produced in recent years, and to one who would work his way into the thought and spirit of the Fourth Gospel no better guide could be recommended.

Mr. Jackson,[2] on the other hand, seeks to inform his readers what has been said by the best scholars both for and against the Johannine authorship, and on the value and proper use of the Gospel as a source of information on the life and teachings of Jesus. While Mr. Scott's is a work of the best sort in Biblical theology, Mr. Jackson's is an essay in the higher criticism of the ideal spirit of fairness and impartiality. He is thoroly familiar with recent German criticism, and in brief compass affords one reasonably full information of the arguments advanced on both sides of the great debate. While inclined to conservative positions, and declaring that "possibly he (i. e., the author of the Gospel) is the son of Zebedee: beyond that 'possibly' we are not prepared to go," Mr. Jackson recognizes the modifications which must be made in views hitherto accepted, especially as to the "extreme subjectivity" of the fourth evangelist, and the freedom with which he has expressed, not the *ipsissima verba* of Jesus, but his own impression of the Master's teaching, "not, perhaps, without resort to a terminology acquired by him on foreign soil." The book may be strongly commended, especially for its accuracy of information and impartiality in presentation of both sides of a controversy, and it is hoped that it will receive attention from any who may suppose that Professor Sanday and Principal Drummond have spoken the last word on this important subject.

[2] THE FOURTH GOSPEL AND SOME RECENT GERMAN CRITICISM. *By Henry Latimer Jackson, B.D.* New York: G. P. Putnam's Sons. (Cambridge University Press.) $1.25.

A Phenomenon in Fiction

WE may as well look out once more for the best and for the worst that can happen to us For men are beginning to be born again with burning hearts. We have missed this red forge of immortal inspiration and strange furies for a century. We have been cultivating the arts of stingy peace, of commercialism and oppression until the very babes have got to be mere nickels of humanity. But now the change is coming, and like all changes it looks ugly, threatening, like a conflagration or an insurrection. But we shall do well to note the signs of it. In literature it shows in the shallow, primitive incendiary stuff one sees on every hand. The earmarks of a new mind at work, young, immature, ferocious. We cannot preserve even the past from it, and the future is its nest egg. Note Guy Thorne's new novel.* It is a kind of psychological phenomenon in fiction. The author has the crass, narrow mind of a modern walking-delegate novelist combined with the gorgeous imagination and prism phrases of the old poets. And this makes *The Serf* a very significant book. It might have been a work of art, but because of the transition state we are in, it is a grinning symptom of the times, a skeleton of the present which the author has dragged out of the remote past.

The scene is laid in the time of King Stephen, a period in England when

*THE SERF. *By Guy Thorne.* New York: R. F. Fenno & Co. $1.50.

wickedness and anarchy reigned, and when monkish historians wrote that "Christ and all his angels seemed asleep." Hyla, the hero of the tale, is a serf belonging to Geoffroi de la Bourne, who was one of the famous robber barons. The narrative turns upon the fact that the great lord and his son outrage the poor serf's two daughters. Then Hyla conceals himself in the forest and kills his master. He makes his escape thru the fens afterward and seeks sanctuary with the fathers at the Priory of Icomb. But he is finally taken by Geoffroi's men-at-arms and after horrible tortures is hung from the highest tower of the great castle. In all of these details the book does not differ from other novels of medieval times, but here the resemblance ends and the phenomenon begins.

In the first place the author dedicates it "to the members of the National Liberal Club," and for him, at least, the significance of the book lies in the fact that he regards Hyla, the serf, as the first radical, a sort of Adam socialist of the twelfth century. He has identified his condition as nearly as possible with that of the proletariat of the present day. One gets the impression from his indignant portrayal of the abuses practiced that he is writing the story with the hope of having the twelfth century reformed at once. He lays his scenes, makes his exposures with a kind of excitement as if he had just discovered the middle ages and demands with the same staccato voice that Mr. Upton Sinclair uses when he writes of Chicago packing-houses that something be done at once. This again is one of the signs of the new mind, its fierce impatience, its childish insistence. Eight centuries have passed since Hyla, the serf, wearing the iron collar of his fate, slipped into the forest to pierce his lord with two arrows for his daughters and one for "Freedom," and we have only got him as far as being "a member of the National Liberal Club," which is very far indeed from being free. But who shall say what may happen now that any man, even the lowest, may be born with the burning heart?

However, if the reader can bear the smell of the sewerage of the twelfth century, and the feel of the big eels slipping thru his toes as he reads, he will find in this book the most gorgeous descriptions of water scenes that have appeared in years. The whole meaning of the marches and fens of the twelfth century, their menace and their beauty, as distinct from the civilized waterways of modern times in England is well portrayed.

A History of Modern England. By Herbert Paul. In five volumes. Vol. V. Pp. 405. New York: The Macmillan Company. $2.50.

With the publication of the present volume Mr. Herbert Paul brings to an end his *Modern History of England.* Even for a man endowed with such superlative wisdom—a man who is never in the least embarrassed in sitting in judgment on the acts and policies of his contemporaries, who feels himself perfectly competent to have advised Gladstone or Lord Salisbury, and to have guided them into safe courses in the crises of their career—it has seemed too great a task to write history before it is ten years old; and Mr. Paul has chosen to end his volume with the fall of the Rosebery Government in 1895. The last volume covers just ten years—1885 to 1895—the momentous years when the question of home rule for Ireland dominated all English politics. The story opens after the defeat of Mr. Gladstone's Government in 1885, a defeat which was followed by six months of a Conservative Government unsupported by a majority in the House of Commons. It is perhaps inevitable that the historian of current events should be partisan, and notwithstanding Mr. Paul's elevation in wisdom and far-sightedness above all the statesmen and politicians of whom he writes, he never disguises either from himself or his public which side he takes in English politics. To many of his readers who remember him chiefly for his trenchant Parliamentary leaders in the *Daily News* in the days when that paper was a political force on the side of the Liberals, it would have been a distinct disappointment if Mr. Paul had become colorless and impartial. Impartial he is not, or only to the degree of criticising without stint the Liberal leaders as well as those of the opposite party. His strongest censure and most undisguised contempt are, however, always

reserved for the Conservative party; and there is scarcely one of the Conservative leaders for whom he shows any respect, either in regard to his sincerity or his intelligence. The only exception—an exception which makes one suspect that the writing of the story is not so recent as its publication—is Mr. Arthur James Balfour. During Mr. Balfour's career as Secretary for Ireland and as Leader of the House of Commons from the death of Mr. Smith in 1891 until the dissolution of Parliament in the following year, Mr. Paul seems to have shared in the very general admiration and esteem which Mr. Balfour won from both political parties. In fact, there is scarcely a man in Mr. Paul's final volume whom he mentions with such cordial approval and with such an absence of cynical fault-finding as Mr. Balfour. Surely Mr. Paul's wisdom and foresight must have fallen short when he accords such a high place to the man whom both Conservatives and Liberals now realize to be a failure as the leader of a modern political party and whose successor is being discussed in his own political camp. The *History of Modern England* will certainly not hold its own either as history or as literature. One merit it has that may insure its retention among books of reference. It has the accuracy of statement in regard to dates and events that might naturally be expected from a good English journalist; and this accuracy is of great value in regard to that borderland of history, much of which has not yet past out of the realm of the newspaper files into that of the standard histories.

In the Fire of the Heart. By Ralph Waldo Trine. New York: McClure, Phillips & Co. $1.10.

The injustice of modern life, and the bitter burdens that are laid upon the poor, form the theme of this spirited exhortation. From the work of the social investigators Mr. Trine gathers the figures relating to unemployment, child labor, pauper burials, the killing and maiming of workers in the great industries and on the railroads, and urges the necessity of immediate remedies. Something more than charity is demanded, he maintains; it is social justice that must be brought about. The world may not be more materialistic than in other times, but

> "The economic conditions during the past few years have produced a class of men so materialistic in their entire outlook, so insatiate in their greed for even larger gain, so drunk with opportunity and power that they would pull the very pillars of the State to the ground if a united and determined people did not come forward and say, *so far and no farther.*"

Evidences of this collective determination he seems to see on many sides. His remedy is apparently not socialism, tho it is socialistic—social ownership of "public service utilities" and of "great natural monopolies." He declares:

> "The wealth that is created by the common needs of the people or by the continually growing life of all the people should belong to all the people. By moral right it belongs to them, and without undue delay that which belongs to the people morally must be made to belong to them legally and by custom."

He looks to the initiative and referendum as the method by which the people will assume what he contends is rightfully theirs. A deep and fervent sympathy with the toilers characterizes the book.

Love's Journey. By Ethel Clifford. New York: John Lane. $1.50.

There is something peculiarly dream-like about these pieces. They all seem strangely remote, shadowy and fanciful. Even the love in them has a twilight and phantasmal cast. It is never quite substantial and joyful, but subdued and elegiac, a yearning rather than a passion. And yet with the unreality of a dream they have, too, something of its hauntingness and fascination. They leave no very distinct impression, perhaps; it would be difficult to remember them particularly. But they weave about the everyday scenes of life a little air of witchery and illusion, such as dusk or moonlight introduces among the features of a familiar landscape.

The Labor Movement in Australasia. By Victor S. Clark. New York: Henry Holt & Co. $1.50.

The appearance of Dr. Clark's book on the history and the achievements of the Australasian labor movement is most timely. Written in scientific spirit, with unprejudiced presentation of both light and shade, the outcome of an investigation made for the Federal Department

of Labor, and composed in orderly manner with the use of clear, unstrained English, the book is a trustworthy guide both for anxious citizens who wish to reassure themselves in view of the growth of the labor movement and for academic students who wish to be posted on the latest doings of the revolting proletariat. Its conclusions will reassure the terrified. Australasia has often been pictured as a country which ruin threatened on account of the seizure of power by organized workmen. In all branches of the legislatures men who have recently been at the bench, the factory and the mine are framing laws to accord with the wishes of the propertyless. In the Federal Government for one short period the Labor party, alone and unaided, was in office. But nothing alarming happened then or at other times in the smaller divisions which they have controlled. Dr. Clark shows that the prosperity of Australasia has not been damaged by the radical laws and the invasion of the industrial field by the Government. These labor leaders, men of the type that control the American Federation of Labor, have shown an Anglo-Saxon preference for grappling with specific evils, careless of high-flown theory, and, in consequence, Minimum Wage Boards, Industrial Arbitration Courts, Old-age Pensions, Chinese Exclusion Acts, National Railroads, and Radical Land Taxation have all been guided by a regard for actual conditions. The leaders have one inspiring hope, the abolition of poverty; but they do not seek to equalize incomes nor to establish the millennium in a year. Convinced that industry and nature jointly produce enough food in civilized lands to drive the specter of hunger forever from all doors, they are striving to readjust conditions, thru the use of their political power, so as to guarantee to every man and woman the chance, with reasonable exertion, to obtain a living wage. They do not even know the titles of the books which European Socialists hold semi-sacred; and they encounter the acrid opposition of the few theory-ridden Socialists who have wandered so far across the seas. Should America's workmen organize in similar fashion and win political victories they may be influenced a little more by the imported doctrines, which, tariff-free, have accompanied Teutonic and Slavonic immigrants; for the proportion of Anglo-Saxons in our land is smaller than in Australasia. But they will travel in the main the broad road which Englishmen and Australasians have pioneered, and, by bringing a little more justice, a little more order into our social arrangements, they may put us a few steps nearer to the golden age.

Christianity in the Modern World. By the Rev. D. C. Cairns, M.A. New York: A. C. Armstrong & Son. $1.25.

A pleasing atmosphere of genuine sincerity, earnest thoughtfulness and vigorous faith attends these able essays on the present position and problem of Christian faith. Mr. Cairns feels that "at no period in all the long story of Christianity has the Christian faith been subjected to so great an intellectual strain," and yet he believes that the great movements, scientific, philosophical and critical, which have created difficulties for belief, have been "part of the great counsel of God," and that "the outlook for Christianity at the present moment is far grander than is commonly believed." The thesis of the book is that to meet the practical needs of society at the present time religious faith is urgently needed, and, moreover, just such a form of faith as the varied forces which have exerted influence upon Christianity have combined to produce. Mr. Cairns contends that both Strauss and Darwin, both modern industrialism and enthusiasm for a new social order, have in fact prepared the way for the very interpretation of Christian truth which is the net result of critical studies. The book suggests wide reaches of outlook and imagination, together with a bracing spirit of courage and optimism, and is distinguished by real literary skill. It is an essay for those who desire to look difficulties in the face and yet remain cheerful. In some respects the author's enthusiasm to show that present social and ethical needs are fully met in historic Christianity lead him to read too much into some of the gospel phrases. It is doubtful if the founder of Christianity intended anything like so much meaning to be obtained from his teaching on "the kingdom" as Mr. Cairns derives from it.

The suggestion of "spiritual strategy" on the part of Jesus in order to deduce from his silence teaching to which he never gave expression is both uncertain and dangerous. It is not the best critical opinion of today that Christ put himself so strongly in the forefront of his teaching as Mr. Cairns asserts he did, or that he used the language of John VI about "eating his flesh," or spoke the word to Peter concerning the rock on which he would build his church. It remains true, however, that these essays exhibit a thoroly modern spirit and both logical and literary ability of a high order.

Essays on the Social Gospel. By Adolf Harnack and Wilhelm Herrmann. Translated by G. M. Craik and edited by Maurice A. Canney. New York: G. P. Putnam's Sons. $1.25.

This translation of three notable addresses of two leading German theologians on the application of Christianity to the problems of modern life should find hearty welcome in America. The first paper, by Professor Harnack, is on the relation of the Church to social and economic reform. After review of the attitude of organized Christianity toward social movements, especially under Luther and the times immediately following, the author sets forth his conception of the present duty of the Church in a manner very enlightening to those who are inquiring why there is not more cordial sympathy between liberal German Protestants and the Social Democrats. The essay is very instructive also on the subject of the true genius of the Christian religion, and as to just how much can be expected of the Church in the way of encouragement of economic improvement. Important considerations are presented to those who advocate from either side, the alliance of Christianity and socialism. A second paper by Professor Harnack is on "The Moral and Social Significance of Modern Education," with special reference to dangers in present systems and practices. The essay of Professor Herrmann on "The Moral Teaching of Jesus" is particularly timely and valuable. Every one has struggled with the precepts of the gospel, "Lay not up for yourselves treasures on earth," "Resist not evil," and a variety of interpretations and solutions are current, but no recent writer has faced the facts more resolutely nor considered the entire problem in its broad relations with saner judgment than has Professor Herrmann. His presentation of the relief to Christian ethics, both in point of clarity and of moral effectiveness, from the critical understanding of the Gospels and of the teaching of Jesus, is highly suggestive and is calculated to lift a load from many lives. His description of certain enthusiastic attempts to carry out the precepts of Jesus in all respects as in reality the translation into modern life of the spirit of Jesus's enemies, rather than the Master's own spirit, is a masterly piece of historical interpretation. The essay is not light reading, but the reader who takes the pains to work his way into its spirit will be rewarded.

Pilots of the Republic. The Romance of the Pioneer Promoter in the Middle West. By Archer B. Hulbert. Chicago: A. C. McClurg & Co. $1.50.

Mr. Hulbert writes entertainingly a series of sketches of the notable pioneers whose efforts transformed the West from a wilderness to an empire. Washington, Richard Henderson, Rufus Putnam, David Zeisberger, George Rogers Clark, Henry Clay, Gouverneur Morris and DeWitt Clinton, Philip Evan Thomas (the railroad builder) and Mercer (the father of the Chesapeake & Ohio Canal), Lewis and Clark, John Jacob Astor and Marcus Whitman are taken as the leaders, and the movements which grew up under their direction or stimulus are recounted. The greater credit for the impulse toward Western settlement is given to Washington, and his indefatigable efforts in directing attention to the rich Western lands, and in securing bounty-tracts for the French and Indian and Revolutionary soldiers are strongly insisted upon. Judge Henderson and General Putnam, as the leaders respectively of the Kentucky and Ohio settlements, have a chapter each, and a warm eulogium is given to Zeisberger, the Moravian missionary, whose many years of service among the Indians were fated to end so dismally. General Clark has probably less than his share of attention, as his campaign against Kaskaskia and Vi

cennes is merely mentioned. Clay is included for his unfaltering support of the great National Highway, and Morris and Clinton get virtually all the credit for the planning and building of the Erie Canal. The chapter given to Marcus Whitman, the Oregon missionary, is particularly commendable. Despite the volumes of writings of late years intended to minimize the work and character of this heroic pioneer, he is here rightly credited with a preponderating influence in the saving of Oregon to the United States. "It was an army of axe-bearers," he writes, "that was to save Oregon; and if Meade won Gettysburg or Wolfe captured Quebec, then Whitman and the Americans who went in his track won for America the Northern Pacific Slope."

Literary Notes

....It has become a fashion to publish the separate chapters of a romance as short stories and then thread them again upon some slender plot and make a book out of them. If there is a lack of unity and connectedness, the more perfect workmanship of the short story is expected to atone for it. Robert W. Chambers is enough of an artist to make such a result possible. *The Tree of Heaven* reads well as a whole, and its chapters were satisfactory apart, as we found them in the magazines. "Out of the Depths" is a story of unusual power, and persuades the reader of its uncanny reality as few tales of the supernatural are able to do. "The Tree of Dreams" is a good story, too, in a lighter vein. Mr. Chambers's heroines are so invariably frank and sweet it is pleasant to know them.

....Parents are fortunately being awakened to the dangers of ignorance and the importance of some careful teaching in matters vital to the health and morals of boys and girls. *The Renewal of Life,* by Margaret W. Morley (McClurg, $1.25), is intended for parents; and the suggestions how to teach biological facts to young children are most valuable. Lothrop, Lee & Shepherd Co., of Boston, bring out a new edition of Dr. G. L. Austin's book, *A Doctor's Talk With Maiden, Wife and Mother* ($1), which is written clearly enough not to be misleading to those who depend upon books for medical advice, altho for help when there is actual disease, the advice of a good family physician, preferably a woman in the case of young girls, is the only safe and sensible resource. There is, also, a new edition of *What a Young Girl ught to Know,* by Mary Wood Allen, M. D. Vir Publishing Co.) This new edition gave e publishers an opportunity, unfortunately used, to correct some errors of fact, such as "chemical (?) tests for anger, remorse," found in the eleventh chapter; the "Self Sex Series" should be revised thoroly by ne competent biologist, in order to make it scientific and accurate in text as it is excellent in ethical intention. Dr. Robert N. Wilson's talks to the students of the University of Pennsylvania should be extended to all students by placing his little book, *The American Boy and the Social Evil* (Winston Co., Philadelphia, $1), on the open shelves in college reading rooms. No more wholesome warning against vice has been published.

Pebbles

"WHAT'S the difference between vision and sight?"

"See those two girls across the street?"

"Yes."

"Well, the pretty one I would call a vision of loveliness, but the other one—she's a sight." —*Cleveland Plain Dealer.*

A BUSY STORK.

A LOCAL newspaper published in Oregon recently contained the following item:

"A large party of neighbors and friends gathered last Friday at the home of Mr. and Mrs. R. D. Jones to celebrate the nineteenth birth of their son Ralph."

ANY OLD LOCK.

Since Paderewski's marriage, the story is being revived of a well-known society woman, who wrote to him for "a lock of hair." She received this reply: "Dear Madame—M. Paderewski directs me to say that it affords him much pleasure to comply with your request. You failed to specify whose hair you desire. So he sends samples of that of his valet, cook, waiter and mattress belonging to M. Pullman, proprietor of the coach in which he traveled in America."—*Public Opinion.*

WHAT FOR?

UP in Boston the other day a young lawyer, who spends most of his time trying to seem busy and prosperous, went out for a while, leaving on his door a card neatly marked:

Will be back
in an hour.

On his return he found that some envious rival had inscribed underneath, "What for?"

O TRAY BEAN.

"I SEE," said the editor, as he glanced over the manuscript of a realistic novel, "that in almost every chapter the villain's automobile announces its approach by a sound which you spell 'h-o-n-q-u-e.'"

"Precisely," replied the author; "it was a French machine."

BLESSED ARE THE COMPASSIONATE.

THE young man stooped, picked up a coin from the floor of the street car, examined it attentively, and then, "Has anybody lost a five-dollar gold piece?" he called in a loud voice.

Instantly the solemn man at the other end of the car strode forward. "Yes, I've lost a five-dollar gold piece," he said eagerly, holding out his hand.

"Well," said the young man, giving him the coin, "I'm sorry for you. Here's five cents toward making good your loss."—*Woman's Home Companion.*

Prosecutions and Stocks

A CONTINUOUS decline of prices on the Stock Exchange since Judge Landis imposed a great fine upon the Standard Oil Company has been accompanied by the cry, originating in the Wall Street district, that Mr. Roosevelt is wrecking the country by his attacks upon corporations, these attacks being his attempts to enforce the laws and to punish those who have violated them. This cry appears to be loudest in the vicinity of persons whose corporations have been convicted, indicted, or otherwise made defendants in proceedings designed to enforce obedience to the statutes, or whose objectionable practices in the management of those corporations have been exposed by official inquiry.

At the same time, the reports of trade authorities, and substantially all the other evidence by which the condition of business is indicated, point to a continued prevalence of prosperity, unaffected by the prosecution of lawbreakers. Let us look at a part of this evidence. Those commercial weeklies whose aim it is to scan the field closely, reported at the end of last week active current trade thruout the land, bright prospects, orders covering the output of industries for months in advance, and the frequent appearance of new "records" of production. Turning from their columns to other testimony, we read in the daily press the statements of many manufacturers and merchants asserting that prosperity in their own fields has suffered no restraint, and that the policy of the Government has their earnest approval.

Original estimates of the size of the crops have been enlarged; the pig-iron output in the first half of the year exceeded that of the first half of 1906 by 750,000 tons; the Steel Corporation's business was more extensive and profitable in its latest quarter than ever before. Fall River cotton mill dividends in the last few months have made a new high record; railway gross earnings showed an increase of 11 per cent. in July and a growth of nearly 10 per cent. during the first seven months of 1907. The year's new issues of railway and other securities have been unprecedented in quantity. In the condition of trade and productive industry there is no warrant for a natural decline of the market value of securities listed on the Stock Exchange.

It is true that a scarcity of loanable funds has raised interest rates. That scarcity is world-wide. It is not less perceptible in Europe than in this country, and it is due to several causes, prominent among which have been an extraordinary absorption of capital in the development of resources and the destruction of it in costly wars. This scarcity tends to reduce the market value of standard securities whose interest rate is low and fixed, by diverting investment to issues whose rates are higher. It is evident that such changes in market values as are due to this scarcity of floating capital have not been caused by our Government's unfriendly attitude toward law-breaking corporations and their controlling officers.

We do not desire to ignore certain conditions or manifestations (to be considered in connection with the execution of the Government's policy), the influence of which has been in some measure unfavorable, altho it has not been sufficient to start the country on the road to ruin or to knock the bottom out of the stock market. The Sherman act, as interpreted by the courts, is a kind of menace to harmless and even beneficial agreements. It should be repealed or amended. But there is no proof that it has been invoked (except, possibly, in one instance) against combinations that did not deserve to be attacked. Mr.

Bonaparte appears to have been recently the victim of dishonest interviewers, but the unquestioned reports of his remarks about the work and purposes of the Department of Justice are marred by flippant and hasty expressions which the Attorney-General of the United States should have avoided. The suggestion, in the Tobacco Trust and Powder Trust suits, that receivers should be appointed was disquieting, and, in our opinion, unnecessary and unwise. Ill-considered and hasty railway legislation by the States has not encouraged investment, and the arbitrary action of the executive officers of certain States has tended to reduce rather than to increase the market value of securities. But all this would not account for what has taken place in the Exchange market in a time of general prosperity.

Everybody knows that by its investigations, suits, indictments and prosecutions the Government has attacked persons of great wealth, interested in powerful financial institutions, and familiar with all the methods of speculative finance that are practised in the money center of the United States. Some of them are experts in the management of the money market and in Stock Exchange operations. We have said that existing business conditions have not warranted a natural downward movement equal in extent to the one that now excites so much comment, and that certain influences admitted to be unfavorable do not account for it.

The capitalists who have been made defendants, or whose offenses have been exposed, may have brought themselves to believe that a legal assault upon their persons and interests is one upon the whole fabric of American industry and enterprise. At all events, they would like to have such a belief held by the business world. They may reason that a prolonged and sensational decline of stock prices, following the prosecution of themselves or their corporations by the Government, tends to create such a belief in many minds. Have they the power to cause such a decline, when it cannot be caused by the influence of existing conditions upon the scattered owners of securities? If they possess the power, would they refrain from exercising it, if thus to the accomplishment of an immediate purpose could be added eventually a money profit?

These are questions which such a movement as the one of the last two weeks suggest to those who know what are the possibilities of Stock Exchange speculation on a large scale, supported by an extraordinary supply of capital. Whenever it shall be shown clearly that a group of aggrieved capitalists have possessed such power and have used it to depress the market, sharply and continuously, with the widespread effect that accompanies such depression, there will be new arguments against swollen fortunes.

National Ownership of the Telegraphs

A general strike of the telegraph operators of course raises the question whether it would be sound public policy to transfer the entire system of telegraphic communication from private to public ownership and operation.

If, as has more than once happened in strikes on street railway lines, the telegraphic employees should be so well organized and the owners so determined not to yield that the service should be completely paralyzed, the situation resulting from a cessation of telegraphic communication would be very nearly intolerable. Nothing, in fact, could be worse, except a complete breakdown of the postal system, and it was because the vital necessity of uninterrupted communication was foreseen that the postal service was made a Government function instead of being left to private enterprise. No one doubts, we suppose, that, if the telegraph had been invented and in practical operation in 1789, it, as well as the mail service, would have been taken in charge by the new Federal Government.

It is true that the assumption that the telegraph service could or would not be interrupted by labor disputes if it were brought under the Post Office Department will hardly bear examination. Letter carriers in this and other countries have their unions and might at any time collectively refuse to work for the

wages paid, or in redress of supposed grievances, just as the employees of Dutch and Italian state railways have gone on strike after the manner of workingmen in private enterprises. Nevertheless it would be only under extraordinary circumstances that government employees would be able completely to paralyze service by combining other interference with their own refusal to work. The United States Government has never tolerated any interference by railway strikers with the mail service. The Government also can so heavily penalize any refusal to work until a given task is completed, and opportunity is given to find substitutes, that the general tie-up can be made extremely difficult. Moreover, the larger a government civil service is, the less likely is it to resort to the crude and drastic method of the strike to further its economic interests. It can achieve its ends more easily, as well as more graciously, thru its voting strength and power to influence legislation.

The chief arguments for and against the public ownership and operation of the great public utilities are so familiar that they need not be repeated here. It is generally conceded that if economy, in the business man's sense of the word, in other words, the profit and loss account, is the supreme consideration involved, private ownership and management are usually superior to government operation. The private management is a business management pure and simple. It rules out all save business interests just as far as it can. And, however much we may theorize about the importance of conducting government business on business principles, no government in the world has ever done quite that, and there is no reason to suppose that any government will ever quite do it. The politicians will to some extent always succeed in looking after their own, and, as a part of their program of self-interest, they will always to some extent sacrifice the "heavy" taxpayer to that larger public which includes voters whose tax bills are negligible.

In this very fact, however, there is an implication, usually overlooked, which is perhaps of some importance. It is just because the politicians will not put government business on a strictly business basis that the public interest is best served by transferring some things from private to public management. This is another way of saying that there are some things in respect of which the profit and loss account should not be made the supreme consideration. The United States Post Office, for example, is year by year run at a loss, but the American people, acting thru their representatives in Congress, will to have it so, in the belief that a net balance turned into the Treasury would not be as great a good to the community as is the cheap transmission of the printed matter, the handling of which is the chief source of loss. The people may err in this judgment, but that is their own affair. In like manner American States and towns nearly everywhere have abolished tolls on ordinary highways and bridges, have made them a charge on the public revenues, and have made their use free to all. In many large cities—New York, for example—no attempt is made to make the water tax fully compensatory for the service.

The time is yet not at hand when the American public will decide to transfer the telegraph service to the Government, regardless of deficits or political evils incident to an enlargement of the civil service, but we can hardly expect that it will never arrive. With every increase of population, of business, of travel for gain and for pleasure, with the growth of the railway service and the multiplication of trains, the telegraph service becomes more nearly a vital function, less a mere convenience. It is only a question of ratios, therefore, whether it should be regarded as primarily a money-making business, or as primarily and essentially an indispensable part of our social organization; as vital as the post office is, and indeed more vital than the work of such a branch of government as the Department of Agriculture. Whenever the day comes that the public estimates the importance of the telegraph system chiefly in its relation to other interests than business profit and loss, it will become a governmental undertaking. A serious war would probably bring about the change at once. A peaceful industrial and political evolution will almost certainly effect it in time.

Color Photography

EVERY photographer has felt that his art would not be perfect until it could reproduce colors. The more beautiful the picture before him the more deeply he regretted the limitations of his monochrome process. But in spite of the immense amount of experimentation that has been carried on continuously ever since the day of Daguerre no satisfactory method could be discovered. At last, however, we seem to be in sight of goal, for it is reported from Paris that the practical difficulties and deficiencies of the Lumière process have been overcome, and all colors can be reproduced on a single plate with one exposure and not much more complicated manipulation than ordinary plates require.

Like many previous attempts, this is based upon the three-color principle. As every child knows (if he has been educated in an up-to-date kindergarten where color tops are played with), white light can be produced by a combination of three primary colors. Any number of suitable triplets can be selected, but the most useful is violet, green and red, or rather reddish-orange. By combining these and making them lighter or darker any desired color and tint can be obtained. Since the eye is limited in its delicacy of perception it can be deceived into thinking colors are combined when they are really separate. The eye cannot distinguish between separate objects if they are too close together in either time or space. If we spin a top made of segments of the three colors it looks colorless. If we place them side by side in minute dots the color also disappears. This is the ordinary process of color printing used in illustrating magazines and making post cards. By looking at a color print with a magnifying glass one can see that it is a mixture of distinct dots of three or more colors.

In the new photographic process the dots of color are made of dyed starch grains. These are nearly transparent, very small and uniform in size. One-third of them are stained violet, one-third green and one-third red. When the three heaps are mixed together the color disappears and we have one gray heap. When they are spread out and stuck on glass it looks like the ordinary ground-glass plate, transmitting light without color, tho somewhat dimmed. The starch grains are crushed down until they form a mosaic and the spaces between them filled with fine charcoal. The plate is then coated with the ordinary silver emulsion, made as orthochromatic as possible.

The plate so prepared is exposed in a camera with the glass side next to the lens. The light must then pass thru the layer of colored starch grains before it reaches the sensitive silver, and is therefore broken up into its three primary colors. Suppose the object taken is a tree. The light from its leaves can pass only thru the green spots, for the red and violet are opaque to it. By the peculiar process of development used this spot covered by the green grain is cleared of its silver, leaving it transparent, while the other spots are made opaque by the deposit of silver. Therefore on holding the plate up to the light the spot we are considering looks green.

The result, then, is a positive and can be used only as a transparency or a lantern slide. But by a different development a negative can be produced and positive transparencies made from that. Owing to the facts that the color layer must absorb part of the light and that a yellow screen must be used to reduce the excessive action of the violet rays, the time of exposure is rather long, from one second on a bright landscape to several minutes for a portrait. The whole process of development only takes half an hour. The natural colors are very satisfactorily reproduced, and the grain is so fine as not to be noticeable.

If the process proves to be as simple and satisfactory as the first reports indicate it will probably be quickly taken up, especially by amateurs, who are always after something new. The three-color processes heretofore in the market have been disappointing. That requiring three different plates viewed thru colored glasses gives beautiful effects, but is expensive and awkward. That having parallel lines of the three colors on the taking and viewing plates gives false tints as often as true.

Candy and Alcohol

Dr. A. C. Abbott, Health Commissioner of Pennsylvania, has propounded the theory, or, as he modestly prefers to call it, the "suspicion," that "the appetite for alcohol and the appetite for candy are fundamentally the same, the choice of one or the other indulgence being determined by the temperament of the individual." There is a good deal to be said in favor of this view. Women as a rule take to candy and men to alcohol, but women are coming to drink more alcoholic liquors and men to eat more candy. Altogether there is a falling off in the amount of alcohol consumed per capita during the last few years, and concomitantly with this there has been an astonishing increase in the consumption of sugar in all forms. In the financial districts and other masculine parts of large cities confectioneries have multiplied so rapidly as almost to rival the saloons.

Chemically sugar and alcohol are similar, and physiologically their action is in part the same. Strictly speaking, sugar is an alcohol, one of several hundred compounds known to chemists by that name, and it differs from ordinary alcohol in having a larger and more complex molecule. Sugar breaks down easily into alcohol by fermentation, and this is the way all alcohol is made. According to Dr. Dixon's experiments, reported before the British Association for the Advancement of Science last week, sugar undergoes a similar change in the body, first forming alcohol, which accordingly can be found in small quantities in the brain, the liver and the tissues even of a teetotaler, and is therefore to be regarded as a normal constituent of all living matter.

Alcohol in small quantities serves, like sugar, as an energy-producing food, both are quickly absorbed from the stomach and rapidly oxidized. But while a slight increase in the amount of alcohol taken impairs or paralyzes the action of brain and muscles, an excessive amount of sugar does not produce any serious effect, and its continued use is not attended with the same danger. Dr. Reid Hunt, of Washington, has proved by experiment that sugar increases the resistance of the system to poisons, while alcohol diminishes it. If, therefore, the candy habit can be developed as a substitute for the liquor habit, one of the greatest problems of modern life will be solved. Instead of sending our drunkards to the gold cure we will have them sugar cured.

Whether candy can take the place of alcohol as an inspirer of conviviality is a question. It is also a question how much alcohol has to do with the high spirits customarily accredited to its use. Professor Cushny, of the University of London, says on this point:

> "It is not sufficiently recognized how often alcohol acts on a man as a pure depressant. The environment of social surroundings is largely responsible for the liveliness, physical excitement and loquacity caused by drinking in company with others. In hospitals no such excitement or exhilaration generally appears after the administration of alcohol."

The part played by alcohol in the promotion of good fellowship, whether it be that of sharpening one's wit or making one more appreciative or tolerant of the wit of others, may therefore not be so great or so unique as it is supposed to be. It is certain that one of the most important reasons for the popularity of alcoholic liquors is that it is an easy way to spend money. About the only way we have of showing our good will to a friend is to spend money on him, and we dare not ask him to meet us without the excuse of drinking or eating. By the introduction of more expensive kinds of candies or soft drinks it might be possible to replace alcoholic liquors, even in their function of financial altruism.

The increased consumption of alcohol and sugar in recent times is largely due to the demand for a quick-acting and concentrated fuel for the body. We are working, like our engines, under forced draft and high pressure, and need something corresponding to their producer gas and petroleum, in place of the old slow-burning wood and coal. Alcohol in any but a dilute form was unknown to the ancients, and sugar is a very modern invention. It is only within the last hundred years that sugar has formed an important part of our diet. Formerly a condiment, it has now become so common that we eat half our weight of it every year. The early prejudices against

candy, that it ruined the teeth, that it was bad for children, that it was an effeminate luxury, etc., have been swept away or reduced to their residuum of reason. It is now fed to soldiers before going into battle, as once they were dosed with brandy, and many a business man revives his flagging energies with a cake of chocolate instead of a highball.

The Unrest of the Nations

LIKE a political influenza, a general popular unrest and dissatisfaction seems to be passing over the world. It is far more general than the extraordinary uprising of 1848, for that was confined to Europe; the present disturbance seems to cover the whole Eastern Continent and to threaten the Western.

Let the reader take his map of the world and pass his eye from one great nation to another and observe how wide is the disaffection. There is Russia, which covers half of Europe and a third of Asia. The people hate their government, and are devising ways to get rid of their Czar and create a really free nation. A whole nation is in rebellion. Then go south, and you come to China, just now hasting to reverse its whole theory of civilization, and face the West instead of the East. It is not the mere introduction of railroads and telegraphs and motor cars; it is far more than that. It is the new education, the new patriotism, the new will to be strong, as Germany and Japan are strong, and then to submit to no foreign dictation. Perhaps the greatest event of the present half-century is to be the renaissance of China, for that will change the balance of the world.

Then look south again to India. We do not wonder that Great Britain is concerned for her Empire. Her chief thought now is of the unrest in India. What does it mean? What will it do? India does not love the nation that has united it and given it civilization and education and peace and prosperity quite equal to the best it has ever had, and that notwithstanding famines and plagues. The Hindus are waking up to the fact that they do not rule, but are ruled, and they are meeting in congresses, and public speakers are haranging the people, telling them that India is for the Indians: and they boycott British goods and repeat their cries of liberty and patriotism and hatred of the ruling power. The air is electric, and General Kitchener holds his army in readiness for something that may be more general and more dangerous than the Sepoy Rebellion.

And so we might go over the whole map. Even Persia demands a new constitution. We begin to see the same unrest in Egypt; and South Africa is trying uncertainly to adapt itself to new conditions, not yet knowing whether the Briton or the Boer is to rule, and both looking askance at the black peril. In Europe, France questions whether her government is truly free, and was greatly startled the other day when it appeared that the army was untrustworthy and that there had been mutiny in various regiments. Not in France alone, but in Germany, in Italy, in Austria, in Belgium, in Holland, in England, the new political doctrine of socialism is undermining the governments, threatening their constitutions, and proving that the common people are dissatisfied with the way they are ruled and are seeking a new liberty. In Great Britain, Ireland is demanding more than her friends can give her as yet, and the British House of Commons has spoken the ominous threat that it will not longer consent to be ruled by rich men whose titles and right to govern come to them by birth. Even in America we see clear signs of the same coming unrest, in the determination that combinations of wealth shall not rule the land. White workmen in the North and black workmen in the South demand their own.

Now what does this all mean? It means that when men are not given full and equal rights they cannot be satisfied when once they have learned what those rights are. But they must learn, and that means education, and education is what we are giving to the most backward of people. Do we consider how dangerous that is? If the Czar would keep his people contented in their misery he must allow them no schools. If Great Britain wants an easy task in ruling India she must withhold schools and colleges. If we want our workingmen,

white and black, to be satisfied to be held under, we must not send them to the public schools, and must not teach them that men are born free and equal. Liberty, fraternity and equality are worse than dynamite to overthrow a State.

This is the trouble with Russia, China and India. The people know too much to be content with what they have when there is more that other people have. Great Britain must show a sympathy with the ambition of the people she rules. She has been teaching them, and she must take the consequences. Every school teacher, every missionary to a backward people is teaching it divine dissatisfaction and rebellion, if those that rule have not the intelligence to meet with sympathy and fellowship in government those that are learning their rights.

India is not the India of a hundred years ago. It is enough to read the prayer with which this last Indian Congress was opened to learn that. But why a Congress? That itself indicates the new spirit which pervades the whole great peninsula. Let us read a part of that prayer:

"O most Gracious God and Father, by whose Divine Providence mankind is ruled and all things are made to work out His good ends, we thank Thee for enabling us, Thy unworthy servants, to assemble once more in this great city for the twenty-second session of our National Congress. We bless Thy Holy name that Thou didst put into the hearts of our leaders, some of whom have now departed this life, to establish this Congress, and didst grant them wisdom and ability to maintain and develop it in the face of manifold and vast difficulties. . . .

"We seek Thy blessing, our Heavenly Father, on the proceedings of the present session of our Congress. Give to the president and all speakers the guidance of Thy Holy Spirit, so that nothing may be said or done here that is not in accordance with Thy holy will. . . .

"We implore Thy blessing on our Gracious Sovereign and Emperor, King Edward, and on the Royal Family. . . . More especially at this time we beseech Thee, O Lord, to inspire all the members of the ruling race with true sympathy for the people over whom Thou hast placed them as rulers. . . .

"Enable us to make ourselves worthy in every respect for the privileges of self-government and participation in the administration of the country which we seek and claim. . . . Grant us the spirit of self-effacement and self-sacrifice and accept our humble services to the glory of Thy Holy Name, and the good of our beloved mother-land. Amen."

You think those are professed Christians who offer that prayer which they have learned within these fifty years thus to express? No, they claim, most of them, to hold the ancestral faiths, but they have been taught to put a new spirit in it. There is nothing in that prayer about Siva or Kali; it is all Heavenly Father, Holy Spirit, one God. It is a new wine bursting the old bottles; and the new wine is bursting everywhere, and the new bottles must be ready for the new fermentation.

The College and the Community

THAT "education never ends" is an old saw, and to a certain extent it is true of everybody, that he must learn till he dies; but that a public school system should be adjusted for adults as well as children is a novel application of the proverb. While San Francisco presses the opinion that adults should not be registered and received as suitable mates for the young, the United States Board of Education is responsible for a very different doctrine. It advocates an educational widening that will leave every adult enrolled as a student, and under an intellectual stimulant from the schools. Will this end in a sort of wider compulsory education? The proposition that the old and the young cannot be under a system of co-education has never been demonstrated—we believe no one will attempt to demonstrate it. The experience of family life would go far to show that, naturally, the lessons of most importance may be learned best together, as well as practiced together.

Professor Klemm, of the Bureau of Education, urges that the public schools should draw into their circle of influence all the adults of a community, and should make the schools temples of a universal and unified education. In other words, a town school should be the school of the town, from the influence of which no one could escape. The German schools in Rhenish Prussia, he tells us, are beginning to draw into their influence the fathers and mothers of the pupils, as well as the older brothers and sisters that have passed compulsory school age. Courses in domestic science, in one instance, are given to about 5,000 girls in the daytime, and in the evening are repeated to over

1,000 adults. A good deal of this sort of work is being done already in New York and in other of our larger cities. What Dr. Klemm would have is a systematic movement of this sort covering the whole country. Every school, especially in cities, should draw into its influence, after the day school closes, at least as many adults, to be instructed by evening lectures, by special instruction and experiments, and by club meetings. He reminds us of the lack of common sense and economy manifested by a people, that invests in its school buildings tens of millions of dollars, but utilizes those buildings only five hours a day, or at most six or seven; while our factories utilize every hour of every day with their three shifts of workmen. Give us, he says, at least two shifts, one from nine o'clock until two, and the other from four until nine o'clock. It is no excuse that our churches are making the same mistake. Hermetically closed for six days, and open only four or five hours on Sunday, they still farther emphasize our egregious waste of money and opportunity.

Brown University has moved off sharply along this line, and there are indications that it will prove to be an experiment that will quickly ripen into a system. Not less than 500 adult citizens of Providence and its neighborhood, including those whose heads are gray and whose minds are already well trained, are enrolled as college boys. The scheme is not only broader, but a good deal more definite than anything that has heretofore been undertaken under the cognomen of University Extension. These adult pupils do not make their appearance according to their own desire or will, but are organized into classes, and appear as regularly as the college enrollment. Some of these students are known as simply "hearers," while others are known as those who are doing "certificate work." That is, a part of the adult enrollment are working for an academic degree; and this degree they will receive, precisely as a college boy gets his degree, by diligent study and by perseverance. Among these certificate workers are enrolled many of the teachers of the surrounding country. They go on with their teaching and their studying at the same time. It is now proposed that older teachers, who become desirous of more thoro work, shall be allowed leaves of absence. It must not be supposed, however, that any large proportion of the enrollment consists of teachers. It includes merchants and professional men of all sorts. The courses offered are so connected that it is possible for students to pursue a connected scheme of study for several terms, or even years. Each Extension Course of ten lectures is credited by the university as equivalent to one-half of the regular term course, and in this way is made to count for an A.B. or an A.M. or a Ph.D.

This scheme is in more ways than one unlike the old University Extension methods. Instead of sporadic lecture courses, it has continuity and system, and it is kept well within the university atmosphere of libraries and laboratories. By granting degrees it places the adult student on a par with his younger friends. Perhaps a very best possible result is its tendency to bring the college and the community into fellowship of sentiment and work. It must go far toward eliminating the alien and lawless sentiment that grows up in connection with isolated institutions. There certainly is no reason why a well-endowed college shall confine its influence within a select circle; no reason why it shall not widen its influence to the utmost thruout a community. President Faunce, of Brown, says in his annual report that he holds it to be the duty of a college or university "to provide intellectual insight, stimulus and leadership to the entire community around it." We are aware that some of our colleges have taken ground exactly opposite to this, and will do no teaching to pupils who are not enrolled according to specific and inherited rules. It is said that there are few more interesting sights in New England than the procession of old men and young, who, each week day afternoon and evening, climb the hill that leads to the university buildings.

This seems to be nearing an ideal community and an ideal social state. There is no reason why a man or woman should withdraw from school life at twenty-one or at graduation from a college. The world is fairly ablaze with new sciences and new developments of investigation. The chemistry of today, as

well as the entomology and ornithology and geology, is a something novel to those who studied it twenty-five years ago. If one would know the world he must keep up with its revelations. And this is important not only for the professional student, but for common people. Why shall we not work together in learning as well as in applying knowledge. On the present system every group of people, say those within five years of each other or ten, are holding a different set of facts and working with different data. The new plan brings together the whole social group, and the young can no longer consider the older as ignorant. The Brown audience is said to be appreciative, receptive, keenly alert and critical. There are no jealousies or prejudices between the old and the young. The movement is certainly promising and hopeful. If it succeed and be adopted by other colleges, the circle of influence and power of these institutions will take in the whole community—mechanics, merchants, farmers, manufacturers, as well as schoolboys.

The Problem of the Trolley

To surpass the steam car in speed, in popular service and in cheapness was the unconscious problem of the trolley. It did not define its mission, but entered the field much as steam had entered it; yet it is solving these and other problems with unexpected speed and certainty.

The first electric roads were opened in Richmond, Va., in 1889; still less than twenty years ago. There are now about 1,000 lines, with above 30,000 miles of track. Over 97 per cent. of street railways have deserted all other methods of traction for the electric; and the very small percentage still using horses or other motive power are as insignificant, as they are hard to find. The earlier cars were as simple as the cheapest horse cars and as lacking in conveniences. In fact, no one expected of them anything more than barely passage from some village into a neighboring city. Gradually came the demand for smoking apartments, and then for compartments, or cars, for baggage and express purposes. On all long lines the toilet-room became a necessity; and in every way the trolley car is now nothing more nor less than a steam car run by electricity.

The advent of these cars, making communication so easy between country towns and cities, roused a decided opposition on the part of country merchants. The merchants of Oberlin, O., issued hand bills denouncing the innovation. In Clinton, N. Y., as elsewhere, the business men were about equally divided, some of them foreseeing nothing but ruin. But the trolley had hardly run for a single week, in either case, before public sentiment, and business sentiment as well, underwent a revolution. It was found that, while the electric car enabled some purchasers conveniently to reach the city, it stimulated many more to reach the town. Business in no case has been reported as checked in the smaller villages, but in most cases it is greatly, and was immediately, improved.

At once the trolley developed an immense increase of travel. The people tried it, and they liked it. It met their needs because of its frequent service. Once an hour is the average of the runs, and many lines send out cars every half-hour. This enabled the housewife to work in a trip between her pressing household duties. Farmers were more particularly benefited. The cars frequently run by their doors, or so near the farmhouse that a short run enables them to take passage without loss of time. It is reported, especially from the Western States, that the trolley has perceptibly raised the price of land. Now that freight service is being added, farm produce can be hauled directly to the city market. In all ways the trolley cooperates with rural free mail delivery, while it is co-ordinated with rural telephone service. It makes rural life immensely more cheerful and less isolated. The price of milk and butter has gone up, because the farmer can now send his products more easily to the city markets.

It was natural for the trolley to develop on popular lines. The newer trolley systems are less and less following the highways. Of three, recently projected in central New York, we learn that only one-seventh of the transit will be made over public ways—all the rest being cross tracks thru farms, where

right of way is obtained, generally without difficulty. Yankees have always been famous for going across lots. The same sort of economics makes these new roads cut thru meadows and potato fields, saving miles of expense in building and many more wasted miles of travel. Another feature of this sort of transit is its novelty, bringing the people into contact with beautiful fields, glens and clover-covered meadows, and at the same time keeping them clear of roadway dust and dust-impelling vehicles. It has been found equally economical on the part of the road itself, avoiding legal complications, while freight and passengers are more easily picked up from side passages.

Cheapness must be a dominating feature hereafter in travel. The requirements of the public are growing more and more complex, and those who have heretofore staid quietly in their country homes, have got to be roused out of their simplicity, while they are afforded transit advantages at a very cheap rate.

The trolley has already done wonders in the way of rousing people to move about and to keep moving. The steam roads have done very little of this service for the country. Their advantages have been for the larger towns and the moneyed classes. They are, at the present time, damaging themselves enormously because they will not put forth specific efforts to reach the people. In the Southern States, particularly, they are leaving the bulk of the population dormant, a population that cannot afford to travel at three cents a mile. The trolley has better understood economics. From the outset it has charged from one cent to one and a half per mile. Tickets are issued at commutation rates for families, for school children, for laborers and all sorts of excursions. Family tickets cover the novel scheme to fill the theaters, also to attend shows and lectures. Many of the suburban parks are the property of the electric companies, who are financially associated with such pleasure schemes, and are even projecting lakes and sanitariums.

Among the newer features of trolley service are shopping stations. This is in recognition of the fact that a large percentage of the passengers are women, who desire to make quick trips, for small purchases, to city stores. A very complete station of this sort is to be found in Cincinnati, being six stories high, with waiting-rooms, news stands, checkroom, passenger elevator, a ladies waiting-room, and luncheon and reading rooms for employees. This station is in the very heart of the city. Indianapolis, Milwaukee and other cities are doing even better for the accommodation of shoppers. In this way we have a constant recognition at both ends of the route, that the intention is to please and serve the public. Little way-stations all around the lots pick up the shoppers, rush them into the city, and there wait on them with the perfection of politeness.

Freight service has developed of necessity. It is only within a couple of years that anything farther was done than to allow large packages to find room, if possible, on the rear platform. At present farm produce is being carried in special trolley cars into the city, and the same cars are employed to carry merchandise out of it. One or two roads, possibly more, are carrying coal, ore and building stone. The happiest feature of this service is where cars are loaded by farmers at their barns, and are hitched on to the main line as it passes by or thru the farm. In many cases these carriages are vehicles owned by the farmer himself. The competition with steam roads is greatly to the advantage of the trolley, and will probably very steadily increase. The trolley employs a motorman and a conductor at a probable rate of $50 per month each. The train crew of a railroad includes the engineer, whose rate per month is in the neighborhood of $200; the conductor, whose wages run from $125 to $175; the flagman, earning from $45 to $55, and the porter about as much more. This does not include the cost of equipment and fuel. The steam car certainly is working at a serious disadvantage in the competition.

Meanwhile other developments are taking place. An exchange from the Continent reports several trolley lines on ordinary roads without permanent tracks. A line is working regularly at Wurzen, Germany, over which thirty

wagons are taken each way daily. All this fits into the new suburbanism, a larger evolution of country life, and a more equable distribution of the forces necessary to make life cheerful and up to date.

Castro and Asphalt

Now comes President Castro adding injury to insult by imposing a fine of $5,000,000 on the American Asphalt Company. Suppose Castro attempts to collect this amount of money, what will the United States do? Our Government has certainly shown in the past a friendly interest in the fortunes of this concern, as the testimony taken at the time of the Loomis scandal shows. At that time the lawyer of the asphalt trust drew up the protocols between the United States and Venezuela that were sent to the American minister at Caracas over the signature of Mr. Loomis, abrogating the agreement already approved by Secretary Hay and President Roosevelt. This put Castro in such a rage that he has ever since refused to arbitrate his differences with the United States, and thus the situation has remained, notwithstanding the efforts of Secretary Root. The country has never got at the bottom of our dispute with Venezuela, of which the asphalt mess forms so large a part. Two years ago President Roosevelt sent Judge Calhoun to Caracas for the express purpose of making an unbiased report on the whole situation, but what Judge Calhoun found out has never been made public. We venture respectfully to ask that "if not incompatible with the public interest" the Calhoun report be published. It ought to have something to say as to the real merits of the asphalt case, and perhaps it would shed some light on the mystery which enables President Castro to continue to spurn the advances of Secretary Root.

Postal Reforms

It has been so long awaited that we are surprised to hear that it has come, the announcement made by Postmaster-General Meyer that the Government proposes to establish a parcel post service and a postal savings bank system, and to manufacture and install stamp-selling machines, and to introduce a simple and practical method of transmitting money. Why, if all this is done we will be almost up with the rest of the civilized world in such matters. These things have not been in common use in Europe more than a quarter of a century, so they are suspicious innovations to us Americans. There is no knowing where this will end. In time it may be possible to drop into a handy branch post office and take out life insurance as in England, or order newspapers, magazines and books as in Germany. Besides, there is the political effect to be considered. If our postal system should become an up-to-date business-like machine it would remove one of the standing arguments against government ownership. We have been accustomed to regard the post office, not as an aid to commerce and the diffusion of knowledge, but as something that only by eternal vigilance and strenuous exertions could be restrained from checking it by vexatious and capricious regulations and classifications. Still the proposed reforms are not yet adopted. Very likely the opposition of the express companies fearing competition and of local merchants fearing the extension of mail order business will prevent them now as hitherto.

What Does It Cost to Raise a Child?

An interesting and possibly profitable discussion has been aroused by the statement recently made by J. G. Brooks at Chautauqua that it costs $25,000 to rear a boy and equip him well for life. In England the papers have taken it up and are publishing numerous letters of estimates and experiences, of which the following is an example:

Nursery, from 1 to 8, $625 annually..	$5,000
Preparatory school, 9 to 13, $750 yearly	3,750
Eton, 13 to 18, $1,500 yearly.....	7,500
Oxford, 19 to 21, $1,750 yearly.....	5,250
Traveling and holiday expenses, 14 to 21, $500 yearly.....	4,000
Total.....	$25,500

The items given for the first period are: Food, $150; clothing, $100; governess or nurse, $250; holidays and traveling, $125; total, $625. A British matron of the same social class, whose daughter has

just been brought out in her twentieth year, confides to the public that $37,000 has been expended on her. For the first eight years the annual cost averaged $1,100; for the next six, $1,400; for the next three, $2,350, while a year and a half at Dresden and Paris, a season in London and presentation at court used up the balance. In this country we have as yet no presentation at court, but the equivalent launching of a debutante may cost as much. The expense of education, or rather of college life, has increased so rapidly here of late that the Eton and Oxford figures may be equaled. But facts are better than guesses. The readers of THE INDEPENDENT include all classes and sections of the country. Can we not obtain from them some careful estimates of the actual cost of raising a boy or girl? We should be glad to publish a few condensed expense accounts. Perhaps it will be convenient for comparison to divide the arbitrary twenty-one years into three periods of seven each, childhood, boyhood or girlhood, and youth. Each division should be classified according to the principal items of expense, such as clothing, board, education, travel, doctoring and dentistry, etc. Any additions to the household expenses on account of the children should be included, and any earnings or savings due to them should be specified and deducted. All communications must be signed, but names will not be published if it be requested that they should not be.

The Billboard Evil

In the article on the Billboard Evil, published in our issue last week, Clinton Rogers Woodruff told how the North End Improvement Club, of Tacoma, Wash., is successfully fighting the billboards by boycotting the goods advertised on them. Since writing his article the club has pursued its activity with such success that it was able, on August 5th, to report further to Mr. Woodruff: "We can state that all the billboards and all the large sign boards in our territory are down. The only thing up now are a few large signs on private buildings and it is probable that no more will be placed in our territory. There is also a large billboard near Wright Park, which we do not consider as being in our district, but which we are trying to have removed. So our campaign seems to be drawing to a close with good results."

If a man did every day all that the dentists say he ought to do to his teeth, all that the manicures say he ought to do to his hands, all that the barbers say he ought to do to his hair, all that the tailors say he ought to do to his clothes, all that the doctors says he ought to do to his food, all that physical instructors say he ought to do to his muscles, all that the professors say he ought to do to his mind, and all that the preachers say he ought to do to his soul, how could he get any time to himself?

A measure is now before the Georgia Legislature ostensibly to purify the ballot, but really to disfranchise the negro. The white man is taken care of by the grandfather clause, all old soldiers and their descendants being excepted from the drastic provisions of the bill. The negroes, however, are proposing the amendment that all old slaves and their descendants be likewise excepted. As long as the negro keeps his gift of humor he may be disfranchised, but not discouraged.

Why this long delay at The Hague? All the Peace Conference needs to do is to send out a police force to frisk the nations of the world.

It is very annoying when you have told your best funny story to have the next man say "That reminds me of a joke."

The articles on "The Opposition of Mars," now common in periodicals, do not refer to The Hague Conference.

The essence of immorality is to regard yourself as an exception to the rules.

Some people think that they are logical when they are merely cruel.

Insurance

Can a Man Afford to Save?

THE following letter comes from a constant reader of THE INDEPENDENT. Such a hypothetical question as he propounds is too difficult for even the Insurance Editor to answer:

To the Editor of THE INDEPENDENT:

There is a prevailing impression abroad that it is becoming harder all the time for a young man today to start an independent business on a small capital, and that therefore in ever increasing numbers he is being forced into the salaried class.

Assuming for the moment this is true, the question arises: Can the average young man save enough out of his salary so that he can retire from business at, say, sixty-five years of age, and live for the rest of his life at approximately the same standard of living that he has maintained during his working period?

It is a common observation that each profession or vocation requires a certain standard of living from those who engage in it, and a person who falls below that standard, from whatever cause, is generally outdistanced in the race of life by his competitors. To take a concrete example: Suppose two young assistant editors find themselves on rival papers, each thirty years old and each on a salary of $60 a week. Suppose one editor plans to save enough out of his income so that he will have enough to retire on at sixty-five and live comfortably ever after. But to save such an amount, or anything like it, he will have to give up clubs, public dinners and all those social amusements where men meet and where much editorial inspiration abounds; he will have to abandon all thought of entertaining and therefore gaining the personal friendship of men of affairs; he can afford his children few of the so called "advantages," and as to travel and tobacco, he must eschew them altogether. Our other editor, callously unmindful of the future, enjoys the worldly delights denied his saving rival, and spends every cent of his income, if not a little more. Now, in the course of a decade or so what will be the relative position of these two editors? Will not provident Number One sink into a threadbare elbowed hack essayist, while spendthrift Number Two, having enlarged his knowledge and influence by personal contact with the men and measures of the day, become the leader of his age, so that if he is not sitting in his shirtsleeves, with his hat cocked on one side of his head and his feet on the desk—the editor-in-chief of some great Trust organ or yellow journal, he will at least have attracted the favorable attention of the President and be holding down a fat Government job? In other words, if men on average salaries want to get on in the world can they afford to save, either by investments, savings banks or endowment life insurance?

A SALARIED MAN.

NEW YORK CITY, August 14, 1907.

THE London *Sphere* tells the following story:

A young wife of Bristol said to her husband one night: "My dear, there is a gentleman in the parlor. He wants to speak to you."

"Who is it? Do you know?" the husband asked.

"Dear," said the wife, "you must forgive me, but that cough has bothered you so much of late, and tho spring is coming on it still clings to you, and, oh! if you knew how worried I've been about you!" And she threw her arms around his neck. "What would I do if I were to lose you?" she moaned.

"Come, come," said the young man, patting her shoulder tenderly, "men don't die of a slight cold. So you've called in the doctor, eh? Well, I'll see him gladly if it will make you feel easier. Which one is it? Squills?"

"It isn't the doctor, dear," was the answer; "it's the life insurance agent."

AN attempt is being made in Kansas to prevent the explosions and resulting fires that have taken place in that State because of the confusion of gasoline and kerosene. A law has been past under which all gasoline sold within the borders of Kansas is required to be kept in cans or other receptacles of a distinctly red color. This law also provides that kerosene must under no circumstances be placed in red colored vessels. A penalty is provided for each and every sale contrary to the law.

LOSSES in lake marine insurance, which were very discouraging to insurance underwriters in the early portion of the season, have eased off somewhat, and if the fall storms should turn out to be as light as they sometimes are some net earnings might be shown.

Financial

Stocks Still Falling

THE decline of prices on the New York Stock Exchange continued thruout the greater part of last week. Transactions amounted to 5,145,900 shares (against 4,402,400 in the preceding week), and five-eighths of the business was done in four stocks—Reading, Union Pacific, Amalgamated Copper and Steel common. Saturday's close left the active list from 1 to 3 points above the lowest figures of the week. Losses of the two weeks are shown below, together with the highest prices in 1907, which in most cases were reported in January:

	High, 1907.	Close, Aug. 17.	Loss previous week.	Loss last week.
South. Pac.....	96¼	81⅝	6¾	1
Union Pac.....	183	123½	16	3¾
Reading	139⅛	87¾	11½	3½
Amalg. Copper...	121⅞	67⅝	9¾	7
Steel com.....	50⅜	30¼	3¾	1½
Am. Smelting....	155	93	14	5½
South. Pac.....	96¼	81⅝	6¾	1
North. Pac.....	189½	115½	11⅞	4½
Penn.	141⅜	116¾	4	1⅜

Anaconda	75⅝	43⅝	5¾	4⅜
Can. Pac.....	195½	162	9¾	4
Erie	44¼	20⅜	1⅝	1⅝
Sugar	137½	111	8	2
Inter.-Met. pr.....	75¼	27¼	8½	7¼
Balt. & O.....	122	87⅝	4¼	2⅝

As in the preceding week, there was no support from large financial interests. Depression was stimulated by pessimistic views concerning the attitude of the Government toward corporations. To the unfavorable influences or events briefly mentioned on this page a week ago there was added an extension of the telegraphers' strike. Reports as to the condition of business were very good, as a rule, and the railways showed further increases of gross earnings.

New York City Bonds

IN June, the city of New York offered $29,000,000 in 4 per cent. municipal bonds to the public. Subscriptions amounted to only a little more than $2,000,000. Last week the city offered $15,000,000 and sold only $2,713,485, nearly all the bids being at par. No offer below par can be accepted. Since this second failure, several hundred thousand dollars' worth of the bonds have been sold at par "over the counter," and creditors of the city have been induced to take a considerable quantity in payment of their claims. As a result of these transactions, bonds taken by contractors who needed cash have been sold by them at a discount and have been quoted in the market at various prices between 97 and 99. Two weeks ago Boston attempted to sell $3,924,000 in similar 4 per cent. bonds, at par or better, and received bids for only $200,000. The explanation is that investors can easily get a better return. Great quantities of railroad companies' short-term notes, running from one to five years, are in the market at prices yielding from 5 to 5¼ per cent. Standard railway bonds can be bought to yield from 4¼ to 4½. Cities in Europe are confronted by similar conditions in the money market. Probably it will be necessary to increase the interest rate on New York bonds.

....Nine of the subsidiary companies of the United States Steel Corporation have taken a ten-year lease of four floors in the McAdoo Terminal Building, in this city, and are to pay for the space $240,000 a year.

....Fall River cotton mill dividends for the last quarter show an average rate of 2.66 per cent., which is equivalent to an annual rate of 10.64 per cent., or the largest return to stockholders in the history of the industry in that city.

....In the last five years the population of the three provinces known as the Canadian Northwest has increased from 419,512 to 808,863. The yield of wheat, barley and oats has increased from 43,252,000 bushels in 1900 to 240,459,000 in 1906.

The Independent

VOL. LXIII NEW YORK, THURSDAY, AUGUST 29, 1907 No. 3065

Entered at the New York Post Office as second-class mail matter.

Survey of the World

The President at Provincetown

President Roosevelt took the occasion of the laying of the corner-stone of the Cape Cod Pilgrims Memorial Monument, at Provincetown, Mass., to reaffirm with great positiveness his policy, and to assure the people that there would be no let-up in the prosecution of those corporations and their officers that have been guilty of breaking the laws. We quote at length the important passages in his speech. After speaking of the character of the Puritans (rather than the Pilgrims), dwelling on both their "iron sense of duty," their sense of "ordered liberty," and their determination to correct all that was wrong, he applied these qualities to present new conditions. He said, as to State rights:

"It seems to me that such questions as national sovereignty and States' rights need to be treated, not empirically or academically, but from the standpoint of the interests of the people as a whole. National sovereignty is to be upheld in so far as it means the sovereignty of the people used for the real and ultimate good of the people; and States' rights are to be upheld in so far as they mean the people's rights. Especially is this true in dealing with the relations of the people as a whole to the great corporations which are the distinguishing feature of modern business conditions."

After declaring that the people are willing that ability and enterprise should gain the largest honest reward, but are determined that chicanery and anti-social use of wealth must be prevented, he continued:

"Most large corporations do a business that is not confined to any one State. Experience has shown that the effort to control these corporations by mere State action cannot produce wholesome results. In most cases such effort fails to correct the real abuses of which the corporation is or may be guilty; while in other cases the effort is apt to cause either hardship to the corporation itself or else hardship to neighboring States which have not tried to grapple with the problem in the same manner; and of course we must be as scrupulous to safeguard the rights of the corporations as to exact from them in return a full measure of justice to the public. I believe in a national incorporation law for corporations engaged in interstate business. I believe, furthermore, that the need for action is most pressing as regards these corporations which, because they are common carriers, exercise a quasi-public function, and which can be completely controlled in all respects by the Federal Government, by the exercise of the power conferred under the interstate commerce clause, and, if necessary, under the post road clause of the Constitution. During the last few years we have taken marked strides in advance along the road of proper regulation of these railroad corporations; but we must not stop in the work. The national Government should exercise over them a similar supervision and control to that which it exercises over national banks. We can do this only by proceeding further along the lines marked out by the recent national legislation."

The President then said that when such new conditions arise there is necessarily at first hesitation and doubt as to how to correct the evils. He continued:

"In dealing with any totally new set of conditions there must at the outset be hesitation and experiment. Such has been our experience in dealing with the enormous concentration of capital employed in interstate business. Not only the legislatures, but the courts and the people, need gradually to be educated so that they may see what the real wrongs are and what the real remedies. Almost every big business concern is engaged in interstate commerce, and such a concern must not be allowed by a dexterous shifting of position, as has been too often the case in the past, to escape thereby all responsibility either to State or to nation. The American people became firmly convinced

of the need of control over these great aggregations of capital, especially where they had a monopolistic tendency, before they became quite clear as to the proper way of achieving the control. Thru their representatives in Congress they tried two remedies, which were to a large degree, at least as interpreted by the courts, contradictory. On the one hand, under the anti-trust law the effort was made to prohibit all combination, whether it was or was not hurtful or beneficial to the public. On the other hand, thru the Interstate Commerce law a beginning was made in exercising such supervision and control over combinations as to prevent their doing anything harmful to the body politic. The first law, the so-called Sherman law, has filled a useful place, for it bridges over the transition period until the American people shall definitely make up its mind that it will exercise over the great corporations that thorogoing and radical control which it is certain ultimately to find necessary. The principle of the Sherman law so far as it prohibits combinations which, whether because of their extent or of their character, are harmful to the public must always be preserved. Ultimately, and, I hope, with reasonable speed, the National Government must pass laws which, while increasing the supervisory and regulatory power of the Government, also permits such useful combinations as are made with absolute openness and as the representatives of the Government may previously approve. But it will not be possible to permit such combinations save as the second stage in a course of proceedings of which the first stage must be the exercise of a far more complete control by the National Government."

No Change in the President's Policy

The President then referred to the disturbed stock market, and the urgency of certain business interests that he remit his activity against illegal corporations. He said:

"During the present trouble with the stock market I have, of course, received countless requests and suggestions, public and private, that I should say or do something to ease the situation. There is a world-wide financial disturbance. It is felt in the bourses of Paris and Berlin, and British Consols are lower, while prices of railway securities have also depreciated. On the New York Stock Exchange the disturbance has been particularly severe. Most of it I believe to be due to matters not particularly confined to the United States and to matters wholly unconnected with any governmental action, but it may be well that the determination of the Government, in which, gentlemen, it will not waver, to punish certain malefactors of great wealth, has been responsible for something of the troubles, at least to the extent of having caused these men to combine to bring about as much financial stress as they possibly can in order to discredit the policy of the Government and thereby secure a reversal of that policy, so that they may enjoy the fruits of their own evil doing. That they have misled many good people into believing that there should be such reversal of policy is possible. If so, I am sorry, but it will not alter my attitude.

"Once for all let me say that as far as I am concerned, and for the eighteen months of my administration that remain, there will be no change in the policy we have steadily pursued, no let up in the effort to secure the honest observances of the law, for I regard this contest as one to determine who shall rule this Government—the people, thru their governmental agents, or a few ruthless and determined men whose wealth makes them particularly formidable because they hide behind the breastworks of corporate organization.

"I wish there to be no mistake on this point. It is idle to ask me not to prosecute criminals, rich or poor. But I desire no less emphatically to have it understood that we have undertaken and will undertake no action of a vindictive type, and, above all, no action which shall inflict great or unmerited suffering upon the innocent stockholders and upon the public as a whole. Our purpose is to act with the minimum of harshness compatible with obtaining our ends. In the man of great wealth, who has earned his wealth honestly and used it wisely, we recognize a good citizen worthy of all praise and respect. Business can be done only under modern conditions thru corporations, and our purpose is heartily to favor the corporations that do well. The Administration appreciates that liberal but honest profit for legitimate promoters and generous dividends for capital employed, either in founding or continuing an honest business venture, are the factors necessary for successful corporate activity, and therefore for general prosperous business conditions."

The concluding portion of the President's address was in the interest of wage-workers, for the protection of men crippled in industry, united effort to suppress tuberculosis, the defense of restricted individualism against socialism, and eulogy of strong, earnest character and effort.

Secretary Taft's Campaign

From the President's emphatic declaration of his policy we turn to the addresses in which his most likely successor opens his early campaign. Mr. Taft's mother's illness is not so serious as to prohibit his starting on his long announced visit to open the first legislative assembly in the Philippine Islands. His first address was made in Columbus, Ohio, before an immense and enthusiastic audience, but it was noticed that the friends of Senator Foraker were not in attendance, and Mr. Foraker took the

first opportunity to reply to the Secretary's proposals. Mr. Taft's address was mainly devoted to the restraint of corporations acting detrimentally, and so covered at greater length many of the points in the President's address. He indicated how the interstate commerce act of 1887 had failed to be effective until the rate bill was past in 1906, enabling the Interstate Commission to fix rates and prevent discrimination and other secret acts of injustice. He explained how the brief period since the law went into effect had not yet allowed its full effectiveness to be manifested, and why convictions had been chiefly under the Elkins law, which amended the law of 1887; and he brought out the fact that the railroads have greatly improved their methods in accordance with the new law. Yet it already needs strengthening. He said:

"The rate law does no go far enough. The practice under it has already disclosed the necessity for new amendments and will doubtless suggest more. Such is the true method—the empirical and tentative method—of securing proper remedies for a new evil. The classification of merchandise for transportation is a most important matter in rate fixing, for by a transfer from one class to another the rate is changed and may work injustice. With the power of rate fixing, it would seem, should go the power in the Commission to classify and to prescribe rules for uniform classification by all railroads."

Further legislation should prevent overcapitalization, or the purchase of competing lines or their control by common directors. And such control, he declared, is not socialistic, but the contrary. It is the evils which such legislation cures that encourage socialism. He said:

"I am opposed to government ownership.

"First—Because existing government railways are not managed with either the efficiency or economy of privately managed roads and the rates charged are not as low and therefore not as beneficial to the public.

'Second—Because it would involve an expenditure of certainly $12,000,000,000 to acquire the interstate railways and the creation of an enormous national debt.

"Third—Because it would place in the hands of a reckless executive a power of control over business and politics that the imagination can hardly conceive, and would expose our popular institutions to danger."

Secretary Taft favors proper rate agreements, which are now forbidden:

"The movement of competing railway companies to consolidate arose originally from fear that the anti-trust act forbade them to make agreements as to uniform tariffs. If they were now permitted to make such agreements subject to the approval of the Interstate Commerce Commission, such a tendency would lose much of its force. It is impossible to prevent competing railways fgrom seeking to make their tariffs uniform in order to prevent an unending disastrous tariff war, and tho such agreements are against the law it is perfectly apparent that tacit arrangements for uniformity exist. . . . . As the public now asserts the right to fix maximum rates and thus to eliminate one phase of competition, it is logical to permit an agreement on rates, if approved by the Interstate Commerce Commission, the tribunal appointed to fix rates."

Mr. Taft then proceeded to the subject of trusts and swollen fortunes, and favored State legislation for an inheritance tax, and implied that the Supreme Court might yet find a plan of Federal graduated income tax constitutional, but he does not now favor such Federal legislation. Here again he argued that the President's policy, which he approved most heartily, does not lead to socialism but the contrary:

"If the people are not convinced that it is possible to eradicate the evils and abuses arising from the unscrupulous use of wealth and corporate combination under the system of private property the movement toward its abolition and the adoption of socialism in some form will gain great strength. President Roosevelt would stop this movement by a demonstration that it is possible under the system of private property by efficient government regulation, supervision and prosecution, to stamp out the evils which have created our social unrest. He knows what a futile remedy socialism will prove to be. Socialism looks to a dead level of life, to an absence of all motive for material progress, to a stagnation in everything. It involves a lack of individual freedom and requires an official tyranny to carry out its system that finds no counterpart in modern government."

At some length he showed how President Roosevelt's policy differs from Mr. Bryan's, and then turned to the subject of the tariff and declared that he favored revision, after the next election, wherever the present tariff gives excessive profits and leads to monopoly.

Mr. Taft's Plea to the South

Mr. Taft's second speech on his way to the Pacific was at Lexington, Ky. In part he repeated the argument of his address at Columbus, but his new matter was addressed to the South, pleading with its voters to break

away from the Democratic party. He said:

"After violent outburst against President Roosevelt for his expressed sympathy with the colored man the men of the South generally have come to recognize the sterling virtues and courage and independence of our President, and I venture to say that there is no section of the country in which he is more popular than he is in the South today.

"It was not an exaggeration when a gentleman of Texas who greeted the President on behalf of one of the cities of that State said to him: 'Mr. President, we welcome you to a State where you have more friends and fewer votes than any State in the Union. . . . .

"If only under the influence of President Roosevelt's Administration some of the Southern States, including Kentucky, could be led into the Republican column in accordance with the real sympathies of the voters of those States it would be a crowning glory of his Administration. It will not necessarily work for the benefit of the Republican party in the end, because the closeness with which the Southern States have united in support of Democratic candidates has introduced a similar cohesion among the Northern States, and we might expect much more independence of voting at the North if the voters there were not confronted with the solidarity of the South. As an American citizen and lover of my country I long for the time when the South shall be received again into the councils of the nation and when the people of that section shall resume the influence to which they are entitled, and which they deny themselves by being frightened at a mere ghost of the past."

As to the negro question he said:

"I am not a pessimist with respect to the race question. I am convinced that it is working itself out, and I am convinced that nothing has so much contributed to its gradual solution as the Thirteenth, Fourteenth and Fifteenth amendments."

He then referred to the great progress the negroes have made, and continued:

"When they exercise independence of judgment in respect to political issues we may be sure that gradually the right to vote will be accorded them, and they will exercise a far more useful influence as intelligent and solid members of the community than the ignorant members of their race would have exercised had they been allowed to vote. In this way, thru devious ways, which cannot be justified or approved, we may still reach a result that will square with the requirements of the Federal Constitution and will give to the negro every political and economic right." . . . "His best friend—the one that can do most for him and the one in many respects who sympathizes with him most—is the Southern white man. He understands his defects. He knows his virtues. And if the negro responds to the opportunities for improvement, as Booker T. Washington points them out, we can be sure that he will grow in the estimation of his white fellow citizens of the South and that the great problem which has burdened the South will be largely solved.

"The Fifteenth Amendment does not require that every negro should vote. All that it requires is that he should not be excluded from voting because he is a negro. If he lacks educational qualifications, property qualifications or any other qualifications that the State may lawfully impose as a rule of eligibility for its voters, then he may be excluded, provided that every one else who lacks similar qualifications is equally excluded. The Fifteenth Amendment is merely intended to secure him in his political rights from race discrimination by the States. It is not intended to give him affirmative privileges as a member of his race. Its strict enforcement does not involve an amalgamation of the races; has nothing to do with social association or equality. It does not involve so-called negro domination, and to permit the question at this late day—forty years after the war—to control the votes of intelligent men in respect to issues that are living is to indicate lack of sense of proportion, which I cannot think will continue to manifest itself in the South."

Senator Foraker

Senator Foraker took the first opportunity to criticise Secretary Taft's speech. Much of his address was devoted to analysis of the Elkins law and the rate law, and explained his opposition to giving the Interstate Commission the right to fix rates. He also called on the Secretary to indicate definitely what revision of the tariff he wanted. He then turned to matters omitted in Mr. Taft's Columbus speech:

"I would be glad if the Secretary would say what, in his opinion, the Chief Executive should do about the defiant nullification of the war amendments to the Constitution involved in such statutes as that passed in Georgia only a few days ago. He is properly in favor of doing all in our power for the eight millions of brown people in the Philippines who were until recently entire strangers and open enemies. But how about the ten millions of black people in America, not one of whom ever drew a disloyal breath, who are openly and defiantly being denied their constitutional rights of citizenship? Is there no power to prevent such an offense against human rights and such an overthrow of our organic law?

"And I would know also what the views of an aspirant to the Presidency may be about the new rebellion that has broken out in some of the Southern States, notably North Carolina and Alabama, in the form of open defiance of the authority of the United States courts. Is this spirit to be checked and restrained, or is it to be allowed to feed upon itself and grow strong to the point of menacing our institutions?

"And now, finally, I would be glad if the Secretary would kindly inform us before he quits the country whether he will this year again advise the Republicans of Cincinnati and Hamilton County, as he did two years ago, to vote against their ticket. The men who will control the nominations that are to be made this year will be the same men who made the nominations two years ago. Are we to again suffer humiliating defeat on their account? If not, why not? Can it be possible that in such a matter it makes a difference whose ox is gored?"

Filipino Disloyalty

Since the election for the Philippine Assembly the emblems of the old Katipunan revolutionary society have been conspicuously displayed in Manila on banners and badges. The Government, believing this indicative of an insurrectionary spirit and provocative of disorder, has issued an order prohibiting the exposure in public or private places of any Katipunan or other insurrectionary flags, devices or uniforms under penalty of from $250 to $2,500 fine or imprisonment for not more than five years. The police have confiscated caps, buttons and transparencies, and the collector of customs refused to admit a consignment of English cotton cloth bearing Katipunan labels until these were removed. A patriotic mass meeting was held in Manila, attended by over 2,500 Americans, approving of the action of the Government and condemning the anti-American agitation. The Nacionalista League sent to the meeting a sort of an apology, claiming that the insults to the American flag were unintentional. The total vote for members of the Assembly is officially reported to have been 97,803, about 1.4 per cent. of the population. Senator Charles A. Towne, who has just returned from a trip thru the southern islands of the archipelago, reports that the Moros manifested a very unfriendly and even threatening attitude, and says:

"Hostility, sullen unfriendliness, thinly veiled and frequently undisguised, is the dominant impression which I received thruout the Moro province."

The Hague Conference

During the week The Hague Conference has been chiefly engaged with the American proposition for an International High Court of Justice (not to be confounded with the Permanent Court of Arbitration established by the first peace congress in 1899). The full text of this proposition has not been cabled to this country, but it was introduced with the concurrence of Germany and Great Britain and will probably come before the whole Conference this week. The most complete text as yet cabled is as follows:

Article I records the desire of the signatory powers to organize an "International High Court of Justice, easily accessible and free of charge, with judges representing the various systems of laws of the world and capable of insuring a continuation of arbitration by jurisprudence."

Article II provides that the judges must be "jurisconsults of known competence in international law, selected so far as possible from the members of the Permanent Court of Arbitration."

According to Articles III and IV the judges are to be appointed for terms of twelve years, and will enjoy diplomatic privileges and immunities while exercising their functions.

Article V provides that the court shall consist of seventeen judges, nine forming a quorum.

Article VI allots the appointments to the various nations.

Article VII provides that the High Court yearly shall appoint three judges, with three substitutes, constituting a special tribunal which can, if necessary, try cases elsewhere than at The Hague.

Article VIII says that the president of the court shall be elected every three years by a majority of the votes.

Article IX deals with the payment of the judges. The amounts are not fixed, but the proposal contemplates a fixed yearly salary, besides special remuneration when engaged in cases, and traveling expenses.

Article X forbids judges from receiving remuneration from their own or other governments for services in connection with the High Court.

Article XI says that the court shall sit at The Hague, except in cases of force majeure and the special instances provided for by Article VII.

Articles XII and XIII deal with secretarial matters.

Article XIV states that the High Court shall sit once or twice yearly, in July and January.

Articles XV, XVI, XVII and XVIII relate to the cases which the High Court is competent to try.

Article XIX provides that "each party shall be entitled to have its own judge to participate in the trial of cases submitted to the court. If a special tribunal acts as a commission of inquiry, even a person not connected with the court can participate in a trial."

Articles XX, XXI and XXII deal with the court procedure and the calling of witnesses.

Articles XXIII and XXIV empower the court to establish its own rules.

Article XXV proposes the ratification of the

convention at The Hague as quickly as possible.

Article XXVI proposes to establish the duration of the convention, but the term is not yet fixed. Any signatory power is entitled to denounce the convention by informing the Dutch Government two years before the expiration of each period, but the convention remains intact for the other powers.

It has been announced that England and the United States have practically agreed to refer the long standing Newfoundland fisheries dispute to the new International High Court of Justice as soon as it is formed. As this is one of the most important questions that could come before the Court it would tend to give the Court a great prestige at the very beginning. The only uncertainty about having this dispute referred to The Hague is the fact that Newfoundland, like many of the British colonies, fears to trust her interests to the Home Government as as the Home Government has sometimes voted against her colonies in their disputes with other States.

The Scottish Land Bill

The Government has suffered another defeat in the rejection of the Scottish Small Land-Holders bill by the House of Lords. This time the blow was struck by the Liberal peer, Lord Rosebery, who made such a brilliant and determined attack on it that it was withdrawn by the Liberal Cabinet. The bill was presented in the Upper House by the Lord Chancellor, who explained its objects and provisions in detail. The purpose of the bill, he said, was the creation of small holdings in Scotland with security of tenure. The land question in Scotland was a very large and important one, and this measure was an attempt to relieve part of the difficulty. The population of Scotland had increased in ten years by 446,000, but the rural population showed a decrease of 42,000. The population of the rural districts of Scotland was now a fifth of the whole, which was remarkable, considering the configuration and character of the country. During the ten years the decrease in that rural population had been nearly 5 per cent. Towns had become overcrowded by the influx of people from the rural districts, and in England and Wales the proportion of people who were living in overcrowded conditions was 8 per cent., but in Scotland it was 46 per cent. In London 1 out of every 7 of the population lived in overcrowded conditions, in Leeds 1 in 10, in Liverpool 1 in 12, in Manchester 1 in 16. But in Edinburgh the proportion was 1 in 3, and in Glasgow and Dundee 1 in 2. The standard of living was the same in each case, the living in more than two rooms. The consequence of this overcrowding in towns had been physical deterioration of the population. The bill established an Agricultural Commission of three persons and a Land Court of five. The latter was to fix a fair rent. A small holding, according to the bill, must be under fifty acres in extent or under $250 rent. The landlord might disposses if the tenant deteriorated the holding or failed to pay rent. The tenant could only bequeath the holding within his own family and could not sublet it. In case the tenant renounced the holding or was removed the land still remained under the control of the Court. The Land Court in selecting tenants was to give preference to applicants chosen by the landlords. Lord Rosebery criticised the bill as unnecessary and unwarranted. Both France and Germany had attempted to promote small holdings and the remedy had failed to meet the disease. In the United States, where there was no blight of landlordism, it was also found impossible to keep the people in the country, there being in the State of New York alone thousands of abandoned farms. The Government was making the same blunder as it had in the case of Ireland; they had offered bread and received a stone hurled with some violence and precision in return. Lord Rosebery further said:

"The principle of the bill is essentially a vicious one. If nobody else goes into the lobby against the clause that applies the crofting system to the whole of Scotland, I will go alone, with or without a teller. What you are attempting to do by introducing the crofting system is to supersede the highest farming known to Great Britain and perhaps to the world, by the most backward system in these islands. That is the remedy brought forward by my noble friend opposite in order that the people of Glasgow may live fewer in a room than they do now."

He objected to the system of divided ownership by which the Land Commissioners could take any piece of land they

chose belonging to a landlord at any rent they may fix and place on it any tenant for any length of time.

Marriage With a Deceased Wife's Sister

Parliament is to be prorogued on August 28th, with very little legislation carried thru, on account of the opposition of the House of Lords. Curiously enough, however, the one measure which the House of Lords has strenuously opposed for the last fifty years has been carried thru—that is, the bill legalizing marriage with a deceased wife's sister. This has repeatedly passed the House of Commons, but has been thrown out every year by the Lords, except in 1896, when it was passed by the Upper House, but failed to get thru the Commons. Last year the bill making valid marriages of this kind contracted in the British colonies was passed. The measure had previously been brought before Parliament by means of private bills, but this time it was endorsed by the Government. It passed the Commons by a vote of 205 to 26, and its second reading in the House of Lords by 111 votes to 79. All the seventeen bishops who are members of the Upper House voted against it on the ground that it was legalizing incest and contrary to religion and morality to thus modify the Levitical code. On the other hand it was pointed out that about 1,800 such unions were actually contracted every year, and that there are some 9,000 children in England who were thus illegitimate in the eyes of the law on account of the prohibition. The bill is retroactive and makes valid all marriages to a deceased wife's sister that have taken place since 1835, altho it will not disturb the status of any property involved.——The pure food bill introduced by John Burns, the labor member of the Cabinet and President of the Local Government Board, passed both houses unanimously.

The Socialist Congress

The International Socialist Congress opened at Stuttgart, August 18th. There were 884 delegates present representing twenty-five different nationalities. The American delegates are: A. M. Simons, Algernon Lee, Morris Hillquit, Vera Hillquit, George D. Herron, Robert Hunter, Louis B. Boudin, Johanna Greil-Cramer, Peter Grund, Otto Kammerer, Charles Stewart, Mrs. Charles Stewart, E. E. Carr, Emil Spindler and Mrs. Emil Spindler, of the Socialist party; Daniel De Leon, Frank Bohn and Dr. Hammer, of the Socialist Labor party; Hugo Pick and H. Heslewood, of the two factions of the Industrial Workers of the World. The Congress was opened by Emil Vandevelde, of Belgium. M. Hervé brought forward his anti-military plan in the form of an amendment advocating desertion and revolt by soldiers in case of a declaration of war. He charged Herr Bebel and the German Socialists with cowardice and bourgeois principles because they refused to approve of revolutionary measures in the army. He supposed that if the Prussian bayonets were turned against Russian revolutionists Herr Bebel would do nothing but talk about the moral effect of their 3,000,000 votes. There was no distinction between wars of aggression and wars of offense. His agitation had demoralized the French army so as to make war an impossibility, but, he added:

"You Germans will follow your Kaiser and level your rifles at the French proletarians defending the barricades on which floats the red flag of revolution."

French people might as well be ruled by German capitalists as by French capitalists. M. Hervé's violent views met with little approval in the congress, and his own French colleagues were foremost in condemning it. M. Vaillant referred to it as "nonsense," and M. Jaurés said that it was a remnant of anarchistic brutality. Herr Volmer, an ex-German officer of aristocratic birth, used the following language:

"It is untrue that internationalism is anti nationalism. It is untrue that we have no fatherland. Love of humanity cannot hinder us for a moment from being good Germans.

"Altho we vigorously combat the egging on of people against each other, it is undesirable that nations should cease and so form an undistinguishable *potpourri* of peoples. To some indeed, the fighting of militarism by the education of the masses may seem too slow, but from any speedier solution only anarchistical recipes evolve, which must be condemned on principle. The idea of abolishing war by a

general strike is as foolish as the idea of destroying capitalism over night.

"We are ready to do everything to restrain the violation of nations and to win influence over governments and public opinion to prevent warlike collisions, but we cannot bind ourselves."

The resolution finally adopted by the Congress unanimously opposed armaments for conquest and imperialism, and declared that should war be threatened, the Socialists are to bring all pressure to bear in an endeavor to hinder its outbreak, and in case hostilities should begin they are to try to bring the war to the speediest conclusion possible, and utilize the commercial and industrial crisis usually following a war to organize for the overthrow of capitalism. The true peace Congress, it was claimed, was that held at Stuttgart, not at The Hague. Harry Quelch, an English Socialist and editor of *Justice,* alluded to The Hague Conference as a "thieves' supper" where the Governments were arranging how to carry on murder and exploitation all over the world. The Würtemberg Government informed Mr. Quelch that he must retract the expression or leave the country. Quelch choose the latter alternative and henceforth his empty chair marked with the placard reading "Expelled by the Government," occupied a prominent place in the Chamber. Another storm center of the Congress was the question of colonies. The resolution finally adopted denounced colonization as a capitalistic measure and a means of oppressing the proletariat and exploiting the natives. The question of the recognition of trades-unions excited a tumultuous and disorderly debate in which the English delegate, Hyndman, and the American delegate, De Leon, took an active part. The resolution finally adopted on this subject was conciliatory and in the nature of a compromise between the two views, declaring that trade unions cannot fulfil their duty in the emancipation struggle unless their policy is imbued with the Socialistic spirit, while the Socialist party must help trade unions to ameliorate the conditions of the working classes. Other resolutions condemned immigration in the interests of capitalism, approved of woman suffrage but opposed any alliance with middle-class feminists, and expressed sympathy with William D. Haywood, prosecuted by the capitalist class in Idaho but triumphantly acquitted.

Anarchy in Morocco

Mulai Hafid, brother of the Sultan, has been proclaimed Sultan of Morocco at Marakesh, the southern capital. This action appears to have been taken in a formal manner by the Ulema and other authorities who condemned the present Sultan, Mulai Abdel Aziz, as a traitor to his country and his religion, and declared him deposed. The name of the new Sultan was placed in the prayers offered in the mosques. A cabinet has been appointed, including Mulai Sidi Mohamed, another brother of the reigning Sultan, who now has him imprisoned in Fez. Many of the powerful tribesmen of the Atlas Mountains have taken the oath of allegiance to the new Sultan, who is expected to march to Casablanca to drive the French from the country. General Drude maintains his position just east of Casablanca in spite of fanatical charges by the Arab tribesmen. Altho an attacking body must pass thru an open zone of 1,500 yards covered by the artillery of the ships and the camp, yet the Arabs have not been deterred, and have several time approached within 400 yards of the French lines in spite of fearful slaughter from shells and machine guns. The chief of one of the tribes, whom the French have named "the Red Kaid," from his costume, has distinguished himself by his undaunted courage, standing alone after his men had been killed or driven back, then retiring in dignified manner amid the cheers of his enemies. The French show some contempt and resentment toward the Spanish troops, because they have not taken part in the fighting, but this is because they are under order from their government to do police duty in the city only, and not to attack the natives unless necessary for their own protection or the rescue of the French. Raisuli has driven back the Sultan's army under El Marani, and they have left the Kmass country. There is no immediate prospect of the liberation of the Kaid McLean.

President Roosevelt and Wall Street

[Last week in our leading editorial we gave our opinion as clearly as we could regarding the causes of the present financial depression. This week we publish the following three articles from Wall Street business men, each representing a phase of the Wall Street view of the matter. It may be said that the Street is divided into four sections: (1)—very small number—who believe absolutely and implicitly in the President and his policy; (2)—equally as small—who condemn him out of hand and say that he is a meddler and a troubler who knows not what he does and wherewith he meddles; (3)—the great majority—who admit that certain reforms were and are necessary, but declare that President Roosevelt has gone about these reforms in the wrong way, and unless turned aside, will do more harm than good, and who hold him largely responsible for the present depression in values; and (4) those—comparatively few in number—who take a generally larger view of the situation and, practically eliminating Roosevelt and Roosevelt policies, declare that the present decline is due to world-wide conditions. As representative of classes three and four—classes one and two may well be ignored—we give our readers the views respectively of Mr. J. S. Bache, head of the banking house of J. S. Bache & Co.; of Mr. Henry Clews, head of the banking house of Henry Clews & Co., and of Mr. Givens, formerly one of the financial editors of the New York *Times*.—EDITOR.]

BY HENRY CLEWS

The shrinkage in Wall Street values has already exceeded $3,000,000,000. This is largely due, not to President Roosevelt's policy, or his actions in connection with corporations, as similar disturbances have taken place in London and elsewhere. English Consols, for instance, are lower today than they have been in the history of the nation.

As a matter of fact, we have had in this country too much prosperity for the last several years, which has caused an overdoing in all channels of work, construction and speculation; in other words, there has been too much business for capital, credit and transportation. Values had become inflated, and in the meantime there were many evidences of corporate dishonesty which shocked confidence by the revelations that cropped out from time to time. Mr. Roosevelt's policy has been forced upon him thereby.

While the penalty now being paid may be bitter for the excesses that have taken place, the situation will be a sounder one in the end, and all interests will be established on a more conservative basis. The great prosperity has forced upon corporations a larger amount of business than they had the ability to handle, hence the flooding of the market with securities to obtain the means to meet the emergency and the excessive issues from that source. It is plain to be seen, therefore, that those who blame Mr. Roosevelt for all our troubles are in error; the actual conditions have been mainly responsible therefor. We are confronted with conditions, not theories.

Secretary Taft's strong endorsement of the President's policy, and the President's own speech, are strong and sufficient evidence that the President cannot be budged from his attitude against the violators of the interstate commerce laws by clamor or criticism, and I suggest that, rather than violently to oppose the President hereafter, it will be well for the corporation magnates and managers to fall in line, and let the President and the public understand that they will strictly obey the interstate commerce and the Sherman anti-trust laws. They might as well accept the inevitable, for it is plainly evident that he will not change, and the statute laws should be observed.

There has been great misunderstanding and much exaggeration as to the intention of the Government officials. All that they propose to do, as far as can be ascertained, is to compel great corporations to respect the law in the same manner as the humblest citizen. When public hysteria has subsided, the effect of past agitation and present action will result in higher standards of corporate management and a keener sense of honor and responsibility.

Let the stockholders of the various corporations join hands in demanding the punishment of the guilty individuals without causing the suffering of inno-

cent investors, and Mr. Roosevelt will accept them as allies in his work of reform. Big money fines punish the innocent stockholders and depreciate values, as they threaten confiscation; while imprisonment of the guilty would enhance values, lift our national reputation to a higher plane, put our securities on a more reliable and honest basis and restore confidence at home and abroad."

NEW YORK CITY.

BY W. R. GIVENS

Wall Street has been set agog by President Roosevelt's declaration in his Provincetown speech that the present depression in the financial district may be in some measure a plot on the part of "certain malefactors of great wealth . . . to discredit the policy of the Government." Mr. Roosevelt has been much in the Wall Street mind for a long time, but this latest accusation makes him, as it were, the central figure, tho quite seriously it can scarcely be said to have improved his reputation among the financiers there.

In all sincerity and after a careful consideration of the facts it may be said that there is scarce one man in a thousand in the Street who believes the President's conspiracy idea to be founded on anything tangible, real or substantial. On the contrary, it is pointed out that quite beyond the Wall Street bailiwick there is depression.

New York City cannot sell its bonds, nor can a number of other cities; several industrial concerns lately have gone to the wall because they could not borrow money and tho their business has flourished; whatever the reason, credit has been so disturbed and confidence so shaken that the best railroads in the country are forced to pay for their loans, if they can obtain them at all, rates that may fairly be termed exorbitant; high-class bonds in the regular bond market are practically unsalable; abroad there is likewise depression, partly in sympathy with the decline here (for the financial markets of the world are very intimately related) and partly because of conditions peculiar to the foreign markets themselves; and last, but not least, the one-time American investor stands gloomily aloof from the market, refusing to buy at even the present level of prices, which but a few months ago would have been regarded as wonderfully attractive.

The truth is, confidence is terribly shaken, the little men as well as the big — the "malefactors" — not knowing "where they are at." In other words, the market's decline in this country has been due not alone to the fact that there has been much selling by the timid, weak or nervous holders, large and small, but to the further fact that there are few buyers. And there are few buyers primarily because the "malefactors" for the most part are so unfortunately tied up in underwriting and other commitments—having furnished money on securities now unsalable to railroad and industrial corporations, in order that these corporations might enlarge their plants and expand their facilities to take care of their increased business—that they now cannot extend the support to the market that ordinarily they might; and, secondarily, because, as has been said, the outside investors continue to hold aloof. These latter seem to be uncertain where the lightning will next strike—whether this, that or the other corporation will be fined and its dividends threatened because of past sins; whether, in short, innocent shareholders may be called upon to pay for the misdeeds or mistakes of officers over whom they have no real control, altho these misdeeds or mistakes may not be so altogether heinous.

Briefly put, the investors' complaint is that the Administration's policy is in effect no certain policy at all, but a constantly changing, fickle, inconstant thing, that, however honest in purpose, leads to an uncertain anywhere, and, because of the dread of its uncertainty and the impetuous manner in which it is undertaken, inspires fear rather than confidence. They do not like the idea, they say, of having the world reformed overnight by a man whose business training, so they contend, has been little or none, but who, the rather, has been merely an officeholder. This, at least, is the investors' viewpoint, and for that reason investors as a body ridicule the Roosevelt idea of a conspiracy "to depress" values. The very men who are accused

of depressing are the very men who have most to lose by a decline in prices. They would gladly have quotations advance, not decline, that they might lighten their burden. If President Roosevelt could but have seen some of the sellers in the last heart-breaking decline—frightened, nervous, timid investors, whose life savings had been perhaps cut in half, no less than richer men who did not hesitate to dispose of their investments rather than face the rocks of socialism and unrest that they seem to think lie ahead—the amendment to his original speech would undoubtedly not have contained his conspiracy charge. There is not a banker in Wall Street who would not have told him that the present market has been and is a most cruel one, and that widows and orphans, clergymen and teachers, professional men and artisans—investors, not speculators—have suffered fearfully. The writer personally knows of a score of such cases.

New York City.

BY J. S. BACHE

Both Mr. Roosevelt and Mr. Taft have spoken along the same lines. Interest centers, of course, on the remarks of the President, doubly so, because it is the personality of Mr. Roosevelt that fills the political horizon. The President's speech was put out purely for political effect, and will arouse further enthusiasm among the rank and file who have not yet begun to feel the baleful effect of disturbed business conditions. This was its object, and to this extent the speech was a success. There was no attempt on the part of the President to reassure business interests. He avers that there will be no let-up in the effort to secure the honest observance of the law. This would be commendable, even reassuring, if it did not mean, not the pursuance of an earnest, sane policy, but the continuation of erratic, changeful and bewildering plunges into new and experimental legislation or attempts at it, which have been so characteristic of the Government's campaign since it was inaugurated. It is, in fact, this inability to predict what is coming next, that has done so much harm to credit and confidence, and which is turning thinking people and powerful newspapers to take a stand against Mr. Roosevelt, notwithstanding their admiration of his remarkable qualities of brain and heart, his unquestioned ability along certain lines, and notwithstanding the great benefit which might be worked out by statesmanlike processes in the direction toward which Mr. Roosevelt has been wildly riding with swinging club and impassioned shouting, in a blaze of light, recklessly arousing the already overexcited people.

This is the danger to which the London *Telegraph* warningly points when it says:

> "If the movement against the trusts becomes a political mania, driven by the impulses of blind and destructive hostility, it will be fatal to the prosperity of America."

The economic situation here, it declares, "corresponds to the political crisis of the Civil War, and another Abraham Lincoln would not be too great for the emergency."

One conclusion is forced upon every one who views without prejudice the attitude of Mr. Roosevelt. He is assuming the position of a supreme dictator. Congress, courts, business, all interests are swept aside, and his intentions alone must be the law. Every person surrounding him officially must bend to his will. None dares raise a protest for fear of disfavor or decapitation. The government of the people is becoming a despotism ruled by a dictator whose slightest wish is dominant.

More than ever since the Provincetown speech the thinking business people have been roused to the fact that an emergency is upon us, and here lies the saving character of the situation. If the thinking American people once become convinced that a halt must be called in methods and utterances, not even as powerful a personality as that of Mr. Roosevelt will be able to stand against that decision.

We have every reason to take such a stand. Prosperity is tremendous. The resources of the country are unlimited. Credit has not had time to become unsound in the three years of prosperity which we have had—held back during one whole year of the three by the unbridled political onslaught against corporations. The situation has not gone

too far to be saved. Why should the country be destroyed thru the unwise methods of one man, even the President? The objects of the Government campaign are all right, namely, the regulation of corporations, but why permit such unwise theoretical devastating methods to be used in accomplishing the result, endangering prosperity, and hurting grievously the small and large investor, with prospective danger to every business interest?

It is a time for every American to put aside his personal grievances, to subdue his admiration for even so popular a personality as that of Mr. Roosevelt, and calmly and sanely to review the methods used and decide as to what at the moment is the wise, common-sense thing to do. It will be fatal to wait for a collapse of credit and the consequent disaster which will suddenly turn the whole people against the Administration.

We have such prosperity that eight months of onslaught against credit, two breaks in the prices of securities, wiping out thousands of millions, and a tense money situation the world over and long continued have not been able to dissipate it. Prosperity may still be preserved, but it can only be done by forcing common sense at the White House.

NEW YORK CITY.

Another Day

BY EDWARD N. POMEROY

LORD, as the evening's curtains lower
And night comes stealing on,
I offer one petition more
Before my day is done.

It is not for belated fame,
Nor yet for honor dear;
It is not to escape the shame
Of failure or of fear.

While many stress and struggle shirk,
And shun the stormy seas,
I ask thee still for earthly work
And not for heavenly ease.

Tho saddened oft by scenes of strife,
By violence and crime,
I am not weary of my life,
Nor out of sorts with time;

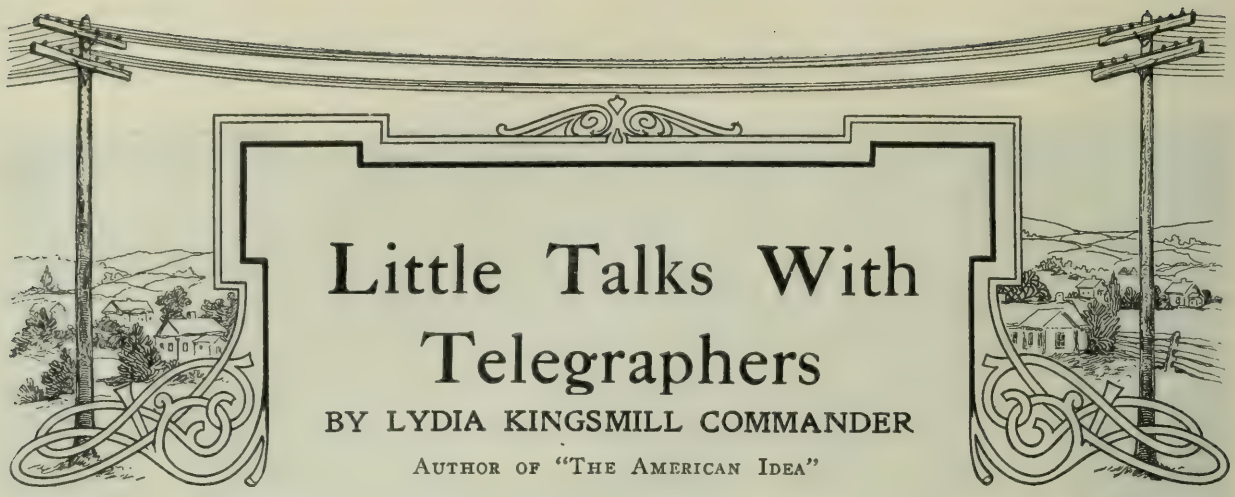
But would return, a child again,
In the millennial age;
Would grow to manhood with its men
And in its work engage;

Would see its sights, would breathe its breaths,
Would hear its battle cries;
Would do its deeds, defy its deaths,
And share its agonies;

Would see the heaven of heavens laid bare,
The earth's foundations rocked;
And powers of light and darkness where
In mortal conflict locked;

Till Wrong is worsted and undone,
And Right receives the crown,
And in the West the sanguine sun
In triumph has gone down.

To dwell in my eternal home
Desire doth not abate,
But to behold thy kingdom come
I bid my longing wait.



Not mine to alter thy decrees,
Nor to assign my task;
But this the day my vision sees,
And this the boon I ask.

WELLESLEY, MASS.

PRESIDENT ROOSEVELT AND HIS FAMILY.

Little Talks With Telegraphers

BY LYDIA KINGSMILL COMMANDER

Author of "The American Idea"

JUST before the forty thousand telegraph operators walked out of their offices, leaving the liveliest part of the country's business hanging on the hooks above their deserted desks, I wandered into a commercial branch-office in New York, where perhaps a dozen instruments were clicking out messages, in their mysterious dots and dashes. A man of about thirty approached me, and finding that he was not, for the moment, busy, I asked him what he thought of his work.

"Oh, I've got kick enough coming!" he replied. "How do you expect a man to like a job with no room at the top—or anyway no ladder to get there, and hard work and low wages where he is?"

"Haven't you good chances of promotion?" I asked.

"Mighty little, almost none at all," was the answer. "I have a pretty good chance of never getting any higher than I am, as long as I stick to the key."

"How long have you been working?"

"About ten years; and in that time I have got my salary up from $30 a month to $65. Think of a man working a whole month for a mean little $65!"

"Do all the men in this office get the same salary," I inquired, as I counted the seven I could see.

"Indeed, no!" was the quick reply. "I'm the top of this heap. The rest of the bunch get $40 to $50 a month. In the main offices some men make as high as $30 a week; but they put in lots of extra time to get it. This is only a small branch, running easy. That is, it's running easy for little old New York. There are times, tho, when we have to get busy, all right. But it's the fellows in the big offices that the work gets after."

"Do you want a strike?" was my next question.

"Do I? Well, I just do!" was the emphatic answer. "We'll never get anywhere without striking. What's the use of growling if you're afraid to show your teeth—yes, and bite, too, when the time comes? These telegraph companies are just like the rest of the gang that are living off the men who work. They don't want to recognize the union—that's the sticker. 'Western Union,'—that's all right, of course. Well, then, what's the matter with telegraphers' union, or any other kind of trade union? We've just got to strike, and keep on striking, till they own up that there's a union, alive and kicking, and that a man has a right to be in his union and live. The way things are, this is a dog's life, I tell you. And men that are men ain't going to stand it much longer."

Just then he was called away, so I turned to another man, apparently of a more placid and contented disposition, and asked, "Do you feel that you have no chance, in this business?"

"Why, no," he replied, in a rather surprised tone. "I think chances are pretty good. Of course it depends on what you're looking for. A fellow of seventeen can earn $40 a month, which he can't at every business. I was making $40 when I was that age. Now I'm twenty-two, and get $45 a month. We often say what we get a month, tho we really get paid by the week."

Four years of service had raised his wages five dollars a month, and he was

content. Curious to know the goal of this man of mild ambitions, I inquired what he considered success. He called $18 a week a comfortable income, for a man who, like himself, was working twelve hours a day and every other Sunday. $25 or $30 a week was "big money" to obtain, which any man ought to be willing, even glad, to work as many hours as he was asked.

"When I get $18 a week," he explained, "I can get married. A good, managing couple can get along on that much, and they ought to be pretty well satisfied to have it. I'm a great believer in the home and the family. I spend most of my spare time with my mother; but I look forward to having a home of my own, and keeping it up as a good citizen should. That's my idea of living. I'm not in the union, and I'm dead against strikes. You can put me down as contented and doing the best I can."

Following the rumor that the railroad operators might support the commercial men, by a sympathetic strike, I traveled to a small station, on a branch line, and found a man who seemed to be a sort of railroad Pooh Bah, a combination of operator, freight handler and station agent. He was about forty years of age, and looked discontented. To open conversation I inquired how long he had been in the business.

"Twenty years; ever since I was young," was his answer.

"And what," I asked, "are your chances of promotion?"

"Look at me and you'll see what they are," he replied, bitterly. "I'm paid the vast sum of $60 a month—don't faint at the princely figure! And I'd expect an earthquake about as soon as a raise."

"Do you think opportunities are better in other lines?" I questioned.

"I think any other job under the sun is better than mine," was his pessimistic response; whereupon I naturally inquired why he did not go elsewhere.

"Why? Because I'm a fool, I suppose. The trouble with me is that I'm too good. I've got a long, clean record with the company, and I'm always hoping that some day they'll remember I'm in existence and give me a shove up. You know, we always hope, even when we're dead sure it's no use. Then I've put in the best part of my life. It isn't easy to change, at my age; and I've got a family to support. That's just where they've got me."

Questioned about his family, he said. "I have a wife and two little girls. I can tell you it keeps us hustling to make ends meet on my pay. We got along all right before the children came, but it's hard scrabbling now."

I reminded him that he was raising the children for the sake of the country, and would, at least, have President Roosevelt's approval.

"Not by a long way, I wouldn't," he denied. "Roosevelt would think a man like me ought to be bringing up six or seven. But it's easy for him to talk, with his $75,000 a year, and the people paying it. Just let me get my hands on the half of it, not every year but only once, and I wouldn't care if the house was full of children. The way I'm fixed now, the two I have don't get any too much, and are not likely to. I'm afraid if I had any more, they'd starve or freeze. You can see we haven't any room to spare; we live in that house." As he spoke he pointed to a small frame cottage, a short distance away.

"Do you get your house free?" I asked. It was so close that it appeared to stand on railroad ground.

He broke into a laugh. "Say, you must take this company for a sort of benevolent society, or any way for one of those get-a-home-quick associations. All I get is my little sixty per, and a string of orders from down the line. You see," he explained, "I don't rank as a station agent; this is only a branch of the main depot. I'm really an operator, and just do other odd jobs for the company—to show there's no ill-will. The reason I live so near is that I can run home if there is a slack time, and there often is; or my wife can leave the children here when she has to go out."

After a train had come and gone, consuming perhaps fifteen minutes of the operator's time, he returned to the conversation. Remarking upon his apparent abundance of leisure, I asked whether he read much.

"Yes," he replied, "I do; but mostly light stuff. I used to care for better reading but I've gone down hill. The

railroad takes the heart and ambition out of a man and he gets so he just puts his time in. I have too much idle time, and that's the worst thing could happen a fellow. I know I'm not up to much. I've got fat and lazy and I just jog along and keep rules so I won't get 'jacked up.' I have a good record, and I keep it good; but I confess I'm not the ambitious man I once was."

"But," I protested, "many railroad men do get to the top."

He shook his head. "Only a few," he insisted. "Most of the top men get up by 'pull,' they don't work up. Of course operators can get to be despatchers, but only one in a mighty lot of them ever gets there, or ever can. And for those who do, it's a ticklish job; any time you may give a wrong order and have an accident, and then you're down again. I haven't got any boy to worry over, but if I had I'd never put him into railroading, if there wasn't another job left on the face of the earth.

"You can see what my life is," he went on. "Every day is just like every other day. For amusement I go to the theater once in a while, when I can afford it—which isn't often. Then I'm a Mason and I attend lodge. That is a sort of a pleasure but it is also a family duty. I joined the Masons because they are the best people in the world to look after your folks if anything happens you."

"What about belonging to your union?" I asked.

"Oh, I know there is one," he answered. "But I've never joined it; never had any money to pay the dues. It isn't strong enough to do anything, anyway. If it ever gets strong enough to raise wages I'll join. Just now it stands me in better with the company not to be in it."

"And, of course, you expect to strengthen it by keeping out," I remarked.

"I ain't thinking or caring anything about it," was his reply. "I've got enough to do to look out for number one. If they want me to join they've got to get busy and show me something in it for myself."

I glanced around the stuffy station and at the tiny cottage. I thought of the wife and children and of the $60 a month. Then I looked at the man of forty, in whom ambition and hope were almost dead. "After all," I suggested, "you do not seem exactly jubilant over what you have done, so far, for 'number one.'"

"No," he confessed. "Still, I'm always hoping the company will think of me some day; and I don't want to do anything to get it down on me. No union, and no strikes for me. I'm loyal to the company that pays me."

Just then the sound of an approaching train was heard, and I left the agent-operator to another interval of business.

The next man I interviewed was a vigorous, alert-looking chap of about twenty-four, who, as I soon discovered, was something of a stoic and a philosopher. He was the night operator in an office where several roads came together, and there was a great deal of transference of freight cars from one line to another.

"How is it that you are so well and strong, when you work at night?" I asked him.

"I am quite a 'physical culture crank,'" he replied. "This is a hard place, and I found, a few years ago, that I was in for a break-down if I didn't look out; so I started on a course of training. I walk several miles every day, as well as riding a wheel, and I usually eat only one meal—tho that's a big one."

This sounded like a strenuous day program, for a man who had to work all night, so I asked when he did his sleeping.

"I sleep a good deal at night," he explained. "After twelve there is a slack time, and I screw up the key till it sounds good and loud; then I shade the lights and go to sleep. If my station is called it wakes me, just as it would if someone called my name. Often, before I get thoroly awake, I will have hold of the key and be sending an answer. I've got a name up and down the line for never being caught napping. Yet I sleep as much as any of the night fellows; and they all do it."

Dropping personal questions, I asked, "What do you consider the good points and the bad, of your business?"

His answer was ready—"The good is that the pay car comes regularly and your boss is a long way off, you are not always being nagged. You can do your work very much in your own way, so

long as you get it done well. The bad is that there is no encouragement for enterprise. I have made a number of improvements that have been adopted by the management and introduced all over the system, but I have received no recognition. Again, we have to work twelve hours a day, every day in the year. If I get a day off, after seven years service, I lose my pay. Worst of all, you never have a record that stands good. A fellow was fired recently who had been with the company for ten years, and had a spotless record; yet he only broke a silly little rule, that nobody really ever does keep. He was a straight, steady chap who had never been suspended in his life."

"What do men get suspended for?" I asked.

"For punishment. Generally you get laid off for periods of from two days up to a month. I have known men who were laid off for ninety days for a very serious trouble."

"So that is how the company punishes you men," I commented. "Now, how do you punish it?"

He looked up quickly, then laughed. "It never works that way," he said. "At least it never has yet. But you know there's a big strike coming, and we may be in it before it's over. We've got to go thru that stage some time. Every union has to strike, until it gets so powerful that it doesn't have to. I think union labor is the finest force in America today. It dared to stand up to the trusts, long before Hughes or Roosevelt ever thought of going against them. Our union is only struggling yet, but it's bound to get power some day."

Before we parted I asked, "What future do you expect, for yourself?"

"None, from the railroad," he replied. "I have the promise that I'll be made a despatcher, with $120 a month. That's the top, for an operator. But it's a hard, driving life that plays out the nerves before middle age. When the strike comes I'm going to quit for good and go out West and see the world. I've been supporting my mother, but I lost her recently. Now I don't have to have any fixed amount; I can live on whatever I can make, knocking round. I guess a one-meal-a-day man, with no extravagant habits, can be free, so I don't intend to stay in the grind."

Then it was time for the stoic-philosopher to go to work, so I said goodbye.

PINE HILL, N. Y.

The Song Sparrow

BY JOHN WARD STIMSON

Lo! 'tis spring!
And the ring
Of his note
Seems to float—thru the air,
With a glow and a flow—everywhere!
"Sweet! sweet! O my love is so sweet!"

As I furrow
And harrow
And plow
The track narrow, mid-air
He darts like an arrow, so near!
My darling song sparrow, so dear!
"Sweet! sweet! O true love is so sweet!"

O sparrow!
No sorrow
I'll borrow
For furrow;
Nor plow, for the morrow, despair!
Brave sparrow, so long as I hear
Thy voice so divine, thru the air!
"Sweet! sweet! O God's love is so sweet!"

REDDING CENTRE, CONN.

Trees

BY FRANK CRANE

[Literary style is very catching. Mr. Crane has evidently been affected by reading Maxim Gorky's impressions of Coney Island, published two weeks ago under the title of "Boredom."—EDITOR.]

ONLY one thing is more dreadful than trees: it is the fascination that lures so many persons to them. They embrace all life in their octopus clutch; children climb them, adults sit under them, dead men are buried in their wood.

While I was in America a gentleman took me out to see a country estate. Everywhere there were trees, trees. They lifted their branches hypocritically to heaven, they drooped fawningly to earth, they reached out horizontally in cruel pride of their enormous strength. I was bored.

Trees rightly typify the tyrannous nature of the bourgeois Deity. Their heart is hard as logic; their leafage obscures the sun and casts a superstitious shade, which the poor dupes love who hate the light. Worms bore them, like higher critics. Some, as apple and cherry trees, have beautiful, fragrant blossoms, only to lure you to smell them or to pluck them, when concealed bees sting you. Ha! We are the sport of destiny.

Such has been the grasping power of capital that tree-flesh, known as wood, has become scarce. Bloated rich men, simpering middle-class wives, sit at tables of wood, and eat and drink, while in the next alley tramps, hideous, bleareyed victims of the social system, sip beer from tin tomato cans. And all the while trees wave and bow and rustle in the distant forests, as if they laughed.

Sniveling, smug-faced parsons all thruout America preach in wooden meeting-houses, covered with shingles, which are tree-scales. The cheerless, grim United States mujiks who frequent these conventicles live in wooden houses, drive to meeting in wooden wagons, tie their horses to wooden posts. Faugh!

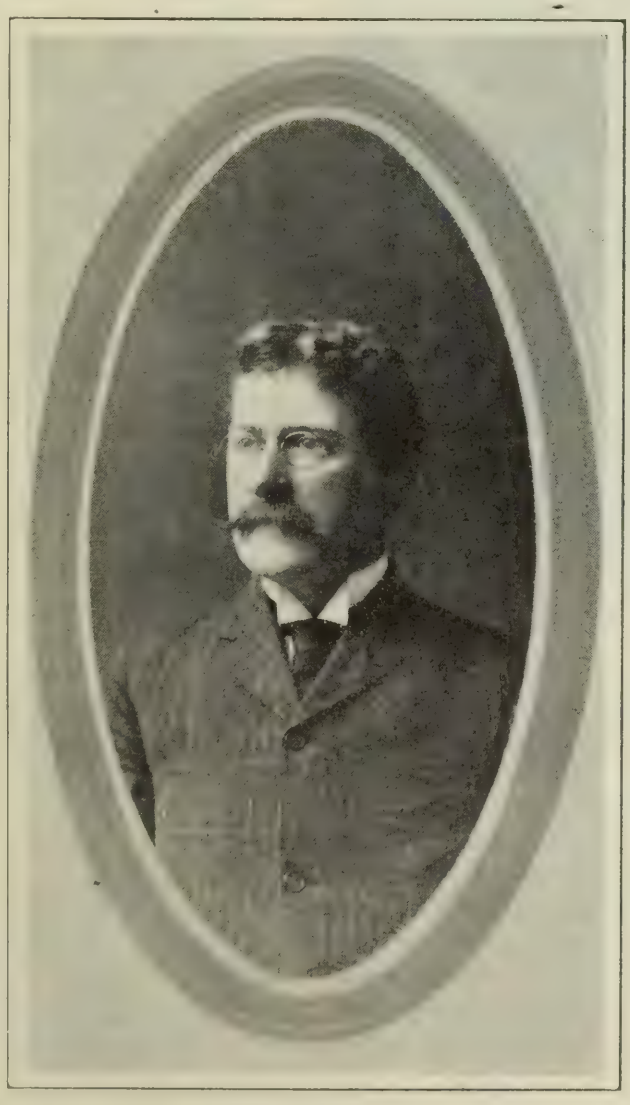
The ancients spoke of "the horror of the sacred woods." They set up their altars in thick groves. On these altars they burned the flesh of animals, fowls and human beings. So long as trees grow we shall have hate enthroned, the poor driven. Policemen in New York have wooden clubs. Hotelkeepers have wooden heads.

Blackeroff Yourbootserowski was a poor bootblack, an immigrant in New York. He was Polish—worse, he was Shoe Polish. He had fled from the iron Old World to find freedom in the United States. He had a soul. But he was a fool. So is everybody. He did not know that freedom in America is merely a name. Nor did he know whose name it was. Neither do I. He married three wives, hoping, longing ever for some one to support him, that he might dream. Each time he married a working woman, and each time the woman refused to work as soon as she was married. He fled from them all. His little wooden box was all he had left, and this he loved with all his passionate nature. Always the gaunt figure of a tree haunted him. Trees, trees were unceasingly waving in his mind. One day a policeman asked him his age.

"Twenty-three," he answered innocently enough.

The policeman struck him on the head with a wooden billy, so that he saw whole rows of trees. He was dragged to jail staggering like a Beerbohm Tree. When he was told he would have to wash all over he hung himself to a rafter. He preferred death to exposure.

On Southern oaks hangs moss; on hall-trees are hung hats; on gallows-trees they hang men. These are facts, in all their bald horror. As I write, my pencil, being of wood, is full of gloom, despair, ennui. I am bored as I write, but I get five cents a word for it. The reader is bored as he reads. What does he get?



WORCESTER, MASS.

The Music of Birds

BY HENRY OLDYS

[Henry Oldys, the writer of the following article, is attached to the Biological Survey of the Department of Agriculture, and is connected with the branch which has charge of the preservation of the game and birds of the United States and the importation of live birds and mammals from other countries. In the course of this work he has devoted years to careful and intimate study of the music of birds, in which he has made many remarkable discoveries and established himself as an authority, both in America and England.—EDITOR.]

EARLY one morning in the spring of 1893 I heard a most attractive bird song. It was uttered in a voice of beautiful quality, and was so clear, so distinct and so true to our scale that it could be easily written down. In order to retain it permanently I therefore made a record of it. I had gone to the country in search of a vigor which my life in the city had failed to give me. I had determined to spend as much of my time as possible in the woods and fields, and had been casting about for a definite pursuit whose interest would draw me into the open air and keep me constant to my projcet. The incident of the bird song gave me the needed suggestion. Why should I not record the songs of birds? I felt assured that the task would be a most congenial one and would keep me out of doors with unflagging zeal.

HENRY OLDYS.

At this time, altho fond of Nature, I was very ignorant of her specific forms. I had feared that by an interest in special objects I should lose the enjoyment of the general—that if I became too intimate with different kinds of flowers, trees and rocks these would distract my attention from the landscape; in other words, that the part would absorb attention that I preferred should be claimed by the whole. The same fear influenced me on first acquaintance with Wagner's operas; I was apprehensive that a knowledge of the particular "motives" would divert my attention from the general musical effects and thus change the appeal from the soul to the head. Experience has, in both cases, partially justified my apprehension; but the gain has more than compensated for the loss. Owing to my deliberate and intentional failure to acquire special knowledge I knew very few of even the most usual birds. Meadowlark, bluebird, phoebe, goldfinch, chickadee I had never knowingly beheld. Of the existence of the beautiful family of warblers I was utterly unaware. To record the songs intelligently it was therefore essential that I make the acquaintance of the singers, and this I decided to do at once.

I found the quest so fascinating that I was very assiduous, and in two or

three months was on terms of great familiarity with nearly all the common summer birds. I had learned, also, that when I had secured a song and had identified the species I was not thru with that species, as I had supposed would be the case, but had merely recorded the utterance of one individual of the species.

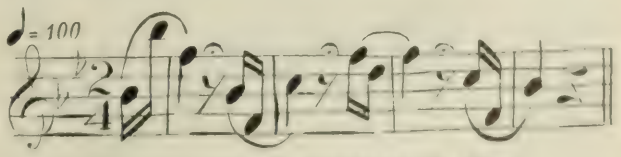
WOOD THRUSH.

Thus I knew three indigo birds that nested close to the house where I was staying, and could always distinguish them by their songs. This, instead of having a deterrent influence, opened up a field to my view that had a most attractive aspect, especially as I found on consulting such bird books as came to my attention that it was one that was practically unexplored. To collect many characteristic songs and publish them in a book that should be at once an aid to bird students and a contribution to scientific knowledge became my aim, and with this definite object in view I continued my investigations with redoubled ardor. Such a book would necessarily be very incomplete, but in my desire to incorporate the new songs I was constantly securing I postponed its final preparation from month to month and from year to year. (I may here confess that it has not yet been offered to the publisher.)

Early in the course of my self-appointed task as recorder of bird music I found that while some of the utterances that came to my notice were readily capable of notation upon our musical staff, many could be represented only approximately, and others were absolutely non-produceable. Of the songs of some species I have no musical record, and, what is more, shall never have any. And among the few species that have given me songs that are true to our scale, many individuals have uttered such as are incapable of exact notation.

Observance of this individual difference led to analytical study of those songs that used one scale, and this in turn led to analytical and comparative study of our own music.

I had hardly entered on this phase of investigation when an entirely new and much broader field appeared before my eyes. My first object had been a pleasant pastime, my second a more or less interesting and serviceable record of bird songs, I now perceived that I had happened upon a line of investigation whose results were of much greater importance than I had before thought of. For comparison of certain of the records I had made with our own music showed identity of form of structure that betokened a close relationship between bird and human music—a relationship theretofore unsuspected and destined to throw much light on such vexed questions as the nature, origin and evolution of music in general and the still broader question of the nature, origin and evolution of the esthetic sense. The resemblances in structural formation between bird music and our own were so many and of such a character as to make untenable any explanation based on coincidence.



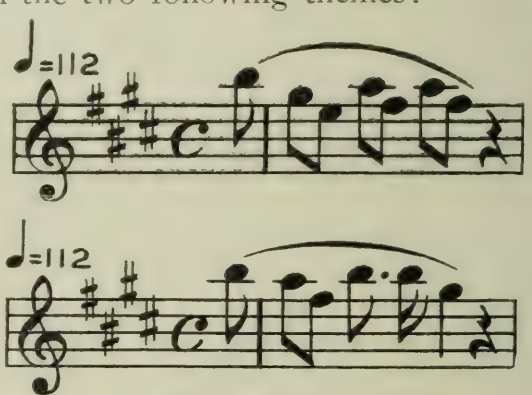
In order to give more intelligent consideration to the questions that now arose before me I examined the history of human music. The light I thus obtained made the resemblances I had discovered still more astonishing; for I found that some of the forms of melodious construction that were to be observed in bird songs were of comparatively recent origin among ourselves, their first use dating back only a

few centuries, while the diatonic scale itself had apparently originated with the experiments of Pythagoras in the seventh century B. C. Investigation of aboriginal and ancient music, however, showed previous and contemporaneous independent use of the liatonic scale and of some of these melodic principles.

Thus was I led to the discovery that various independent musical evolutions, one of which is to be found in the avian world, are moving along the same channels; and this in turn gave rise to the resultant conclusion that from some unknown cause the evolution of music is guided in a certain direction—that is, toward an ideal standard, and is not a fortuitous growth, as is commonly held by students of our musical development. This is the field which at present engages my attention and in which I am constantly securing additional and important material.

The results of my investigations have been repeatedly published by means of magazine articles, lectures and addresses at the annual meetings of the American Ornithologists' Union. (It seems scarcely necessary to deny a statement that has been going the rounds of the press that they have formed the subject of official publications of the Department of Agriculture; the study of bird songs finds no place in the line of work conducted by that department, and my investigations have been entirely independent of my official duties, which relate to the preservation and importation of birds and game.) I may therefore be properly excused from pointing them out with greater particularity. One especially remarkable point of resemblance between bird and human music, however, cannot be too strongly emphasized. I have found the woodpewee (a bird not even classified among the singing birds) and the wood thrush uttering songs, in some cases identical, in others nearly so, in structural form with many of our four-line ballads and hymns. This particular form, which is a growth of the last century or two, is in such common use that an examination of two books of vocal music disclosed forty-four compositions that followed it—compositions by such writers as Balfe, Donizetti, Bellini, Mozart, Samuel Lover, Stephen Glover, Meyerbeer, Wallace, Flotow, Verdi and Weber. The form is governed by the following unwritten rule: the first and third lines are identical, the second and fourth are identical in notes or character except that the second ends with a note that leaves the musical sense suspended and the fourth with one that satisfies it, that is, the keynote. There may be more, but it is not necessary; the first four lines form a complete musical period. (It is interesting, tho not germane, to note that when the verse thus written consists of eight lines the seventh is usually identical with the first and third.) The woodpewee song, which, as I have pointed out in *The Auk,* is usually sung in the twilight hours of morning or evening, follows this form strictly, as I have heard it sung by certain individuals; the wood thrush song I heard from only one bird, and it varied slightly from the rule, tho the first and third lines were identical. I have also heard a four-phrase song from a summer tanager, in which the second and fourth lines were identical.

I may also call attention to a hitherto unpublished song I secured from a wood thrush that nested near my home in Takoma Park last summer. This song consisted of four phrases, usually, tho not invariably, sung in a certain order. In the normal song the first and third phrases resembled each other somewhat in general character, the second past from tonic to dominant harmony, and the fourth, by an exact reversal of the notes of the second, past from dominant to tonic harmony. The whole song, while not so pleasing in melody as many others I have heard from wood thrushes and other birds, is an excellent example of good musical form, and is an important addition to the evidence of structural resemblance between avian and human music.



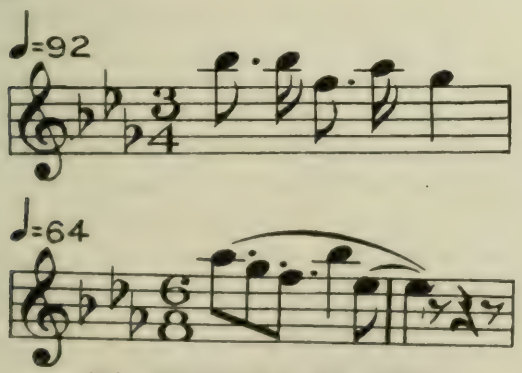
I. WOOD THRUSH MUSIC

A question that has naturally suggested itself in connection with bird songs that are framed on lines that follow those governing human music is: Have the birds sufficient musical intelligence to

appreciate their own musical attainments, or are they merely unconscious instruments on or thru which melody is performed? Numerous experiences and careful observation leave no room for doubt in the matter. Birds sing for the same reason that man sings and whistles and plays on various instruments—to give expression to the sense of musical beauty within, which they share with man. Song may be used by bird and man to charm the prospective mate; it may be uttered as an overflow of the joy of life; it may be joined by man, and perhaps by bird, to emotions of love, triumph, or religious sentiment; but however varied its uses or connection. beneath all is the general foundation of pure appreciation of music, and all other motives are merely incidental superstructures upon this. Birds exhibit in a modified degree many of the traits that characterize man; and that particular quality known as the esthetic sense they manifest in various ways. They show a predilection for bright colors, as in the case of jackdaws, magpies and other birds, which seize and secrete bright and highly colored objects, and in those plumage displays in which peacocks, birds of paradise, jacanas, pheasants and many more birds frequently indulge; they often show a high sense of the ornate in the construction of their nests, a quality of which William Hamilton Gibson has given notable instances, the result of most careful and painstaking study, and examples of which are constantly coming to light in stray notes here and there from other naturalists; they display appreciation of the attractiveness of graceful posturing and rhythmical dancing, by single performers, by pair, by trios and by larger groups; they enjoy special forms of flight, very pleasing to see and indulged for no other apparent purpose than esthetic gratification; and however much Darwin may have overestimated the influence and function of sexual selection, brilliantly plumaged birds very palpably appreciate the beauty of their own garb, a feeling unquestionably shared by their often plain-colored mates. In all these ways birds show an appreciation of grace and beauty that is governed by a standard coincident in kind with that which governs its own. For the things that please them also please us, and for the same reason.

But it is in music that they reach the highest degree of agreement with man in the esthetic faculty. For not only do they utter with evident enjoyment melodious combinations of notes that are, as I have stated, governed by rules of construction governing modern human music, they show by conscious selection of suitably harmonizing phrases that they are subject to the same influences in the matter that lead man to his own choice. In other words, some of the birds may be ranked in a certain degree as composers of music. A brief account of some of the incidents that have come to my attention will substantiate this statement, remarkable tho it may seem at first glance.

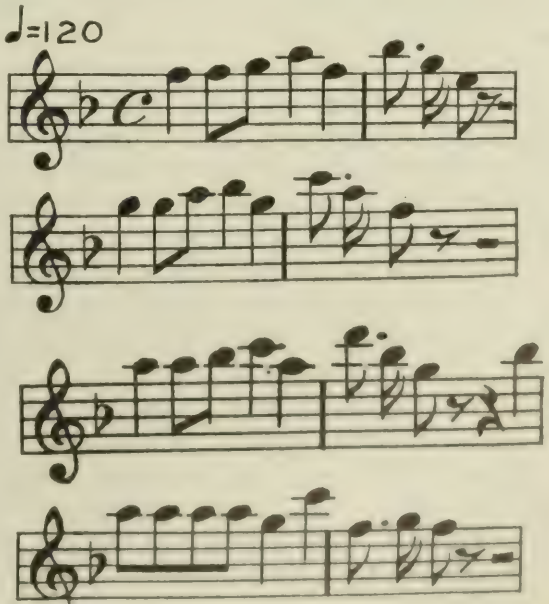
I have frequently heard birds of the same species singing alternately phrases that have a definite musical relationship to each other, such as the second line of a human song bears to the first. Thus, on the 12th of last April I heard two meadowlarks singing in regular alternation the two following themes:



II. MEADOWLARK DUET.

Even were this the only example I had met with the chances that its musical agreement was due to mere coincidence would be so remote, considering the innumerable unrelated combinations of notes possible to the second bird, that such an explanation might readily be dismissed as too difficult of acceptance even by the most credulously skeptical mind But being but one of many as it is all thought of coincidence as an explanation must be banished as childish. It would be as probable that two untaught birds should, by accidental combination of syllables, utter intelligent question and answer, such as "Where have you been?" "I've been down by the river." Were

we to hear wild birds thus conversing in English, not once, but often, any attempt to explain the phenomenon by the theory that the birds, without any conscious appreciation, uttered these and similar sentences by a purely accidental grouping of unmeaning syllables would be no more puerile than the idea that the related phrases they sing in alternation are apt haphazard utterances.



But a final proof, if such were needed, is given in instances that have several times come under my observation where one of two birds singing unrelated phrases has abandoned its theme and substituted for it one that is a suitable musical response. One of the most recent examples of this display of musical understanding was furnished me by a meadowlark on the morning of April 18th of this year. Two meadowlarks were singing related phrases in the key of B flat, while from across a broad field came the song of a third in E flat. One of the nearer birds stopped singing. The other repeated his B flat strain twice then changed to one in E flat that was musically related to the song coming over the meadow, furnishing not an answer to that but a theme to which it was an answer. And as tho for better hearing of that distant strain the bird changed its perch to one that gave a nearer and less obstructed range. The two E flat phrases are here given, that of the distant bird being placed last, where it properly belongs.

III. MEADOWLARK TRIO.

On another occasion a meadowlark changed its theme to furnish a phrase related to one another meadowlark had begun to sing, and while these two were regularly alternating their songs a third "cut in" with a related phrase and the three sang twice round in sequence to three themes. This is the only recorded instance, so far as I am aware, of a trio sung by birds.

This form of antiphonal singing which is, apparently, not infrequently practiced by birds, especially meadowlarks (tho I have observed it among chewinks, chickadees, song sparrows and field sparrows), and particularly when an unrelated theme is replaced by a related theme, leaves no room for doubt that the birds have sufficient musical intelligence to appreciate those melodic requirements that we are subject to. And knowing, as we do, that their music is in other respects closely related to ours such would be the natural conclusion were there no such direct evidence as I have secured. But, as I have already mentioned, birds show the possession of many human traits. Among these is individual variability. Not only is there the well-known difference in musical requirements on the part of different species, but great diversity is manifested by the different individuals of a species. This fact must be borne constantly in mind by one who studies bird songs. Most song sparrows, to take a notable example, utter songs that have little or no relation to our music—songs that cannot even be recorded owing to the non-use of our scale. Yet occasionally I have secured from song sparrows bits of melody that could not be distinguished from human music. Here is a song of four lines, three of which I composed while the other was taken note for note from a song sparrow:

IV. SONG COMPOSED JOINTLY BY MR. OLDYS AND A SONG SPARROW.

I defy any one, ornithologist or musician, to pick out the line furnished by the bird. The entire composition is thoroly homogeneous and has a hint of Mozart in its construction. The last line of this joint production was the song sparrow's, the first three were mine.

The extent of individual variation which this song-sparrow song exemplifies must be duly appreciated if one would avoid the danger of hasty conclusions. Hearing a superior cardinal and an inferior wood thrush one might be led to conclude that cardinals outrank wood thrushes as singers, as I did during the early part of my studies. And meeting with only incoherent and untrue songs on first acquaintance, one might easily conclude that any attempt to write the songs of birds on the musical staff would be a waste of time or worse. It is only occasionally that I hear a notable song or singer, and all species, even wood thrushes, show more or less deficient musical ability. Should any musicians be led by my discoveries to undertake similar investigations—and the field is so large, so open, and so attractive that I should like to see capable men flock to the woods and meadows by the thousands, each equipped with a note-book and a pitch-pipe—I would warn them against two pitfalls, one, a too great eagerness that will cause them to write down every song they hear whether it is properly notable or not, and two, a too-ready discouragement due to failure at once to hear songs that can be written on our staff.

I have frequently been asked which bird is our finest singer, and it might naturally be supposed that fourteen years of careful study of bird music would qualify me to render an authoritative opinion. But, tho I have heard the songs of birds in many different localities in the Eastern part of the United States, yet my observations have been very largely confined to a very circumscribed area near Washington, and I am not by any means as well qualified to render judgment on our singers as it might seem on first thought. Besides the individual differences to which I have called attention there are geographical differences to be considered. Thus no one of the innumerable oven-birds of the region adjacent to Washington utter a song which bears any likeness to a repetition of the word "teacher," ascribed to the oven-bird by John Burroughs, whose characterization of the song has received most hearty endorsement by several other leading writers on birds. To hear this song one must go North, when, however, the usual (tho not invariable) oven-bird utterances fully justify the description. One of our most highly praised singers, the hermit thrush, rarely sings in its migratory journey thru the vicinity of Washington, and the few songs it vouchsafes, like those of the ruby-crowned knight and other birds, lack much of the vigor and finish they have in the breeding home. Furthermore there are many singers, such as the Western solitaire (whose song has received high praise), that I have never heard.

If, however, I were called upon to make a decision based on my present imperfect knowledge, I should say that considering quality of voice, style of delivery and musical form the wood thrush is entitled to the award. And from what I have been able to gather from accounts of the singers of other countries supplemented by personal judgment of the singing of some of the most notable of these foreign birds (a rather unsafe criterion), I am inclined to believe that the wood thrush is pre-eminent in the entire avian world. A proper caution compels me, however, to emphasize the fact that this opinion is subject to possible future modification.

As a final word I would call attention to the beautiful and interesting songs that are lost to us for want of some one to record them—songs that briefly brighten the world and die with the singer. If my investigations in a very limited locality have produced so many records of remarkable songs as I have in my note books, the number unrecorded must be beyond computation. This waste of opportunity to secure interesting and valuable material to serve as a basis for intelligent consideration of questions that have engaged the attention of Spencer, Mivart, Weissmann, Helmholtz and other leading philosophers of the world seems wanton and reckless and I never fail to urge upon musicians the enjoyment and importance of recording and studying the music of the birds.

WASHINGTON, D. C.

An Early Scheme to Organize the World

BY EDWIN D. MEAD

[In view of the probable action at the present Hague Conference that will make the future Hague Conferences assemble hereafter automatically and periodically, and thus take the first steps in creating the Parliament of the World, the following article of Mr. Mead, containing a remarkable and generally unknown letter from Erasmus, is of much present interest. Mr. Mead's work for peace, whether as historian, author, editor or lecturer, has been surpassed by no other American.—EDITOR.]

THE "Great Design" of Henry IV of France is generally considered the first explicit scheme for the organization of the world, or, at any rate, for the federation of Europe. There is, of course, much controversy as to whether the design was Henry's own or Sully's, in whose memoirs we have our information about it. I have little doubt that the main idea was Henry's, altho it is quite possible that its proportions grew somewhat in Sully's treatment of it.

Sully began to dictate his memoirs shortly after Henry's death in 1610. The first edition was published in 1638, after Sully's death. The world, therefore, had no knowledge of the "Great Design" until fifteen years after Emeric Crucé published, in Paris, in 1623, his "Le Nouveau Cynée." In this remarkable work, the only known copy of which is in the Bibliothèque Nationale in Paris, was presented what the historians of the peace movement usually count the first proposal of substituting international arbitration for war. Crucé advocated the establishment of an International Court of Arbitration at Venice, as the Landgrave Ernest of Hesse-Rheinfels half a century afterward advocated the establishment of his proposed "Tribunal of the Society of Sovereigns" at Lucerne. These are the famous beginnings of the movement for world organization.

I have recently come upon an old letter from Erasmus to a friend, written probably about 1517, or having reference to that period, referring to an effort at that time in behalf of the peace of Europe, which was so comprehensive and definite in its character that it seems to me that it may almost be considered a "Great Design" previous to the famous scheme of Henry IV. The letter, which is printed in the introduction to an English translation of the "Complaint of Peace," published in London in 1802, is as follows:

"It was a favorite project about that time, to assemble a Congress of kings at Cambray. It was to consist of Maximilian the Emperor, Francis the First, king of France, Henry the Eighth of England, and Charles, the sovereign of the Low Countries, of which I am a native. They were to enter, in the most solemn manner, into mutual and indissoluble engagements to preserve peace with each other, and consequently peace thruout Europe. This momentous business was very much promoted by a man of most excellent character, William of Ciervia; and by one who seemed to have been born to advance the happiness of his country and of human nature, John Sylvagius, chancellor of Burgundy. But certain persons who get nothing by peace and a great deal by war threw obstacles in the way, which prevented this truly kingly purpose from being carried into execution. After this great disappointment, I sat down and wrote, by desire of John Sylvagius, my Querela Pacis. But since that period things have been growing worse; and I believe I must soon compose the Epitaph instead of the Complaint of Peace, as she seems to be dead and buried and not very likely to revive."

The "Complaint of Peace" (Querela Pacis) here referred to is Erasmus's famous and most important work impeaching the war system of nations as he witnessed it in his day. It was not, of course, his first or only impeachment. He discussed the subject in the same spirit in his panegyric to Philip, Duke of Burgundy, at Brussels, in 1504; and from that time until the end of his life he lost no occasion to condemn war, arraigning the crimes, the corruption of morals, the fearful cost and waste, the destruction of life, and the injustice incident to it, with a thoroness and power beyond that of any other person in his

time. The best known of these impeachments, perhaps, is the section upon war in the "Praise of Folly," which was written in 1509. He was deeply stirred upon the subject when he was in Rome some three years before, and found the pope himself, Julius II, waging war. "War was bad enough at the best, but a papal war was a scandal to Christianity, and a fighting pope was to him a monster of iniquity. The impression of Julius II leading a campaign for the recovery of Bologna never quite left him. It served him for a text whenever he felt free to speak his mind upon the subject of war." In 1514 he says in a letter to the abbot of St. Bertin: "What do you suppose the Turks will think of us when they hear of Christian princes falling out so furiously with one another, and that for a title to empire?" He informs us in one of his *Adagia,* itself a long dissertation on the evils of war, that when he was at Rome he had drawn up a treatise on war called "Antipolemus," inscribed to Julius II, and he speaks as if he intended to print it. No essay with this title appears among his published works; but it seems to me not unlikely that what he here meditated may have been included afterward in his "Complaint of Peace" in 1517. The dissertation referred to is introduced under the proverb *Dulce bellum in expertis.* The publication of the old English translation of it under the title "Antipolemus" causes some confusion. An American edition of this, together with the "Complaint of Peace," was published in 1813 (by Charles Williams, Boston, and D. Allinson, Burlington, N. J.). This is of great significance in the history of the American peace movement, as it was a year before the publication of Noah Worcester's "Solemn Review of the Custom of War." It was at the time that David L. Dodge and his friends in New York were considering the formation of their New York Peace Society; and it would be interesting to learn whether there was any connection between the two things.

The "Complaint of Peace" is dedicated to Philip of Burgundy, the Bishop of Utrecht; and the bishop's letter acknowledging it is dated December 6th, 1517. In the dedication of his work to the bishop, Erasmus says: "You and I have lately seen that certain persons, much more formidable to their friends and fellow-countrymen than to any enemy, have left nothing unattempted to prevent the final cessation of war; and in another case we have seen with what difficulty those who were real friends to their country and king could lately obtain that peace which is always desirable and in the present conjuncture necessary. It was this shameful behavior which induced me to write my 'Complaint of Peace.'"

The intimation here that what men like William of Ciervia and John Sylvagius were working for in connection with the Congress of Kings at Cambray was "the final cessation of war," together with the whole spirit of the discussion of the "momentous business" in the letter of Eramus quoted above, shows that what was really in mind was something vastly more ambitious and constructive than a mere treaty or anything which we usually associate with what actually happened at Cambray in 1517. In a letter to Ammonius, December 29th, 1516 (the letter can be found in the second volume of Nichols's edition of Erasmus's letters), Erasmus says: "They say that before long there is to be a meeting of sovereigns—that is to say, Maximilian, the King of France, and our King Charles, at Cambray, when the question of an inviolable peace is to be considered." We know that the sovereigns did not meet at Cambray as proposed, but a treaty was concluded by their representatives there, March 11th, 1517. This, however, was clearly something quite incommensurate with the "grand design" of William of Ciervia, John Sylvagius, and, I think it is fair to surmise, Erasmus himself. The whole matter is something which I wish we knew much more about than the histories tell us. It is doubly interesting in this year 1907, when the movement for the organization of the world has proceeded so far that we are witnessing the meeting, in the capital of Erasmus's own country, of the first true Parliament of Man; and when the cornerstone has just been laid there of the Temple of Peace, the palace of the

World Court, presented to the united world by a citizen of the United States. It is certainly significant, in view of the "momentous business" now being transacted in Holland, that it was the Dutch Erasmus who framed the first great impeachment of war in modern times, and the Dutch Grotius who a century later did the greatest work for peace which has ever been achieved by any single man.

The "great design" of John Sylvagius and his friends, whatever it was, came to nothing. The "great design" of Henry of Navarre had a strong element of selfishness in it: its primary motive was to effect a combination against the House of Austria. The first clearly conceived and at the same time really disinterested design for an organized world was William Penn's "Essay Toward the Peace of Europe." Most philosophic of all the founders of our American commonwealths, William Penn, publishing his great tractate after his return to England, did not forget to pay tribute to the "great design" of the French king; nor did he forget that the Dutch Republic had in modern times furnished the most impressive illustration of that great principle of federation whose extension to international affairs it was the purpose of his work to urge.

High on the great tower over the Philadelphia which he founded, and where by happy augury was organized this federal nation of brotherly love, Penn's statue stands, so colossal that its outline is clear against the sky. He is not looking toward the West, as he fittingly might do, contemplating the growth of the republic which he helped to birth. More fittingly still, he is looking toward England and Europe, beyond the sea. Today he is our symbol, speaking for us to the world, declaring to Europe, to the august Parliament of Man assembled in the land of Hugo Grotius and Erasmus, that America in this great hour is not chiefly looking inward, but outward; in our behalf pledging the nations that the United States will do her part for the high interests of the united world.

The Standard of Decent Living

BY ARTHUR B. REEVE

[Last week we published an article by Albert Britt, entitled "The Actual Cost of Living." This week Mr. Reeve, of the editorial staff of *Charities*, continues the discussion of the question of "Who Pays for Prosperity?"—EDITOR.]

IN last week's INDEPENDENT Mr. Britt has shown that the cost of living has increased, accompanied by an inadequate increase in average income. But that, after all, is not the real heart of the problem. Men may be living in some fashion at or near the limit of their incomes, but still be far below a decent standard of living. Not how men are living, but how they should live, is the great question affecting not only them but future generations.

Dr. Edward T. Devine, general secretary of the Charity Organization Society of New York, some time ago made an estimate that was tentative, which showed that:
